### THE WEEK.

THE education committee of the London County Council contemplate for their institutes and schools of art the establishment of new classes in subjects for which there have been frequent applications in the present session; the holding of additional meetings of existing classes rendered necessary to accommodate the increased number of students in classes which are highly successful; the establishment of classes in craft subjects in respect of which there is likely to be a demand for skilled workers in the immediate future; classes for practical instruction in artistic handicrafts to complete the facilities for instruction in certain branches of such work; the provision of the requisite equipment of materials to enable the classes to be conducted on the lines and up to the standard approved by the Council, or to meet the needs of extensions in the work of the institutes which have been already sanctioned by the Council; the continuance of free instruction to promising students from elementary schools, and the delivery of special courses of lectures on various subjects by well-known specialists, who are to be paid out-of-pocket expenses. Among the proposals are the delivery of a course of twenty-five lectures on architectural history at the Camberwell School of Arts and Crafts, and also twelve lectures on subjects of general interest in the same school, the employment of a teacher of costume drawing at the Hammersmith Technical Institute, organised visits to museums, &c. The Council is an influential body, and many technical students are likely to take advantage of the facilities offered in preference to those of the Government schools.

THE American National Fire Protection Association have arrived at the conclusion that a hollow concrete block wall is better than a frame wall, for the simple reason that it is incombustible and will withstand moderate fires which would feed upon and destroy wood, but it is inferior to a brick wall on account of liability to breaking from unequal expansion, probability of continuous cracks through wall at imperfect mortar joints, and especially on account of tendency to poor workmanship in manufacture. The highest fire resistance will be found in the block that has (1) the thickest shell, or the nearest to solid (it should never be less than 2 inches thick). (2) That contains a good brand of Portland cement. (3) That contains one part cement to not more than four parts sand or other aggregate. (4) Is made with the wettest mixture practicable. (5) Is most carefully cured or aged not less than thirty days before using, during which it is frequently moistened by water spray or steam. (6) Which provides solid blocks for the course on which joists or girders rest, instead of allowing said timbers to rest on

or hang to the inner side of a hollow shell which may break off. The use of hollow blocks is not extensive in this country, but they have many advantages, and could be produced under more favourable conditions than those prevailing in many parts of the United States.

AN area of 4,200 square feet in Old Broad Street was certain of realising a large sum. It is true the property consisted of a church. But nowadays City churches can be regarded simply as survivals which may have architectural or historic interest, but whose removal would not cause much regret to congregations. At the opening of the sale of the site and fabric of St. Peter-le-Poer on Tuesday, Mr. TEWSON, of the firm of Messrs. DEBENHAM, TEWSON, RICHARDSON & Co., said that 100,000*l.* would be a fair value for the property. The price obtained was not far short of that sum, for the amount was 96,000*l.*, or about 23*l.* per square foot. The origin of the title is unknown. According to Stowe it was "so-called for a difference from other of that name, sometime peradventure a poor parish, but at this present there may be many fair houses, possessed by rich merchants and other." The church which was sold on Tuesday does not date from further back than 1788, when the old structure was taken down on account of its decayed condition. The building was designed by JESSE GIBSON and was consecrated in 1792. On plan it was circular with a recess for the altar, and was lighted from above. The church was restored in 1888, when the gallery which surrounded the interior was removed. As an example of architecture it possessed little interest, and it seemed out of place in modern Old Broad Street.

THERE is some satisfaction in knowing, when inconvenience is caused by motor-cars hurrying along ordinary roads, that the inhalation of dust is not always dangerous. Dust from any hard stone (such as flint, granite, sandstone, &c.) is undoubtedly very injurious to the lungs, producing a marked predisposition to phthisis. On the other hand coal dust, cement dust, and probably many other varieties of organic and inorganic dust have by no means the same serious effects. During the inquiry by the Departmental Committee appointed to inquire into the ventilation of factories and workshops many experiments have been made by Professor RITCHIE with a view to finding a means of experimentally distinguishing the more injurious from less injurious dusts, but unfortunately no satisfactory results have as yet been reached. The committee recommend the use of respirators for workmen only in exceptional cases, where the air contains poisonous or otherwise dangerous dust, and for that purpose a sheet of cotton wool is found to form an efficient respirator.

## SOUTHWARK CATHEDRAL.\*

IF considered as a seat of episcopal authority the cathedral in Southwark may be said to date from yesterday, for the see was only inaugurated on May Day 1905. But the history of the building which is used goes back to an early time. STOWE has recorded the interesting tradition of the founding long before the Conquest of a nunnery on the river bank by a maiden named MARY, who possessed the monopoly of a ferry over the Thames previous to the erection of the earliest London Bridge. As the watermen continue to have privileges in our day, it is not unlikely that some remote representative of theirs claimed the sole right to carry people across the river. The nunnery, according to STOWE, afterwards became a college for priests, who erected a bridge of timber, and then one of stone to supersede the ferry. Subsequently the monastery was used as a priory for Augustinian canons, the founders being the Norman knights, WILLIAM PONT DE L'ARCH and WILLIAM DAUNCY. The priory church of St. Mary Overy would, of course, have been in the Norman style. A few fragments still exist, but they are not sufficient to indicate the character of the building. Near it the Bishop of WINCHESTER erected a palace.

In 1212 there was a fierce fire in Southwark, and the priory church did not escape. Crowds of citizens rushed across London Bridge to witness the spectacle. The wooden buildings on the bridge were caught by the flames, and almost simultaneously another fire broke out at the London end of the structure. Efforts were made by boatmen to save the unfortunate people who were massed between two quickly extending fires. But owing to the excitement the boats were overturned, and it is supposed 3,000 or 4,000 lives were sacrificed. The church was restored and a large chapel dedicated to MARY MAGDALEN was added by PETER DE RUPIBUS, who was Bishop of Winchester. The works were completed in 1235. The columns, it is said, were cylindrical. But some years afterwards they were encased in order to present a polygonal section which was then in favour. According to STOWE, it was necessary to rebuild the church in the reign of RICHARD II and HENRY IV., and "the roof of the middle west aisle fell down in the year 1469." The priory was surrendered to HENRY VIII. in 1539, and, continues STOWE:—"About Christmas next following, the church of the said priory was purchased of the king by the inhabitants of the borough, Doctor STEPHEN GARDNER, bishop of Winchester, putting to his helping hand; they made thereof a parish church for the parish of St. Mary Magdalen, on the south side of the said choir, and St. Margaret-on-the-Hill, which were made one parish of St. Saviour."

It is well to note that in 1539 there was also surrendered an abbey in Bermondsey which was known as St. Saviour's, and the two are sometimes confounded. The abbey was originally established for the Cluniacs, and its position is recalled by Crucifix Lane, &c., while the church of St. Mary probably stands on the site of the monastic church. The cathedral is the church of St. Mary Overy.

The Crown held possession of the new St. Saviour's, the inhabitants of the borough paying an annual rent of 50*l*. In 1614 nineteen of the parishioners were able to purchase the property for 800*l*. The parishioners then became patrons of the living until 1885, when an Act was passed by which the right of presentation was transferred to the Bishop of ROCHESTER. There was consequently the unique arrangement in force during a long time by which, instead of a vicar or rector of the

parish, there were two chaplains. As they were a law to themselves, or were entirely controlled by the parishioners, it is easy to understand the neglect of the building after 1614.

There was likely to be another cause which was unfavourable to the parishioners taking an interest in the church. Southwark is closely associated with the early history of the English drama. It contained numerous inn yards in which theatrical performances could be witnessed from the surrounding balconies. Several theatres were also erected in Southwark. There was a bull ring in the High Street, and a bear garden was another popular institution. A large number of actors preferred it for a residence. In St. Saviour's were buried a brother of SHAKESPEARE, FLETCHER and MASSINGER the dramatists, HENSLOWE, who owned a theatre, and other worthies. Crowds of the citizens of London crossed to Southwark for amusement. The manor belonging to the Bishop of WINCHESTER was allowed to enjoy some immunity from the general law, and in consequence taverns and other resorts were erected there in which more freedom prevailed than elsewhere. With such an environment it was not likely that much attention would be given to services in the church or to the building itself. It is possible the church of St. Saviour was also disliked because within it HOOPER, who had been Bishop of Gloucester, ROGERS, a prebendary of St. Paul's, SAUNDERS, a rector of All Hallows, and others were tried for their alleged heresy and sentenced to the stake. There must have been extraordinary causes, or so important a church, which might be considered as belonging to the City of London, would not be allowed to fall into so discreditable a condition.

It is not necessary for us to trace the progress of neglect. It is said that Sir CHRISTOPHER WREN mutilated the fine altar-screen in order that it might serve to support a partition of wood and plaster which was to act as an altar-screen in keeping with the Renaissance spirit. JOHN CARTER visited the church in 1797 and again in 1808, and in the interval he says the work of dilapidation was so rapidly and silently carried on, to make room for stables, manufactories, &c., that he feared that in another year every vestige of antiquity would be consigned to oblivion.

In 1822 it was decided that some steps should be taken to secure the safety of the congregation, who used then to worship in the choir and lady-chapel. The whole of the groined roof of the choir was taken down as well as the upper part of the walls. The chapel of St. Mary Magdalen was demolished. GEORGE GWILT, who obtained the commission, took care to make his work appear new. For the masonry a sharp grit-stone from Houghtree, near Kirkstall Abbey, was used. In other parts white surface flints were employed. In 1829 and 1830 ROBERT WALLACE acted as architect, and in restoring the south transept he believed it was necessary to shorten all the windows. In the north transept he introduced a window with circular tracery. The nave was not much used. It was therefore considered prudent to avoid any chance of casualties, and the whole of the nave was in consequence removed. We give an engraving to show the appearance of the lady-chapel in 1834, and it is enough to suggest the difficulty of attempting to restore order in such a chaos. The arch which is filled up in the view led to the bishop's chapel, of which the founder was unknown. It was supposed to date from the time of EDWARD III., and it was taken down in 1830. After a time a Mr. ROSE was entrusted with the work of the nave, and he, like the other restorers, was allowed to follow his own sweet will. Ten years ago we published the reproduction of a drawing by JOHN BUCKLER, F.S.A., representing a part at the west end of the nave and south aisle which had been concealed for more than three centuries, and most of the details were thought to be characteristic of early thirteenth-century work. The groined vaulting of the nave was regarded as necessary, "owing to an unaccountable

\* See Illustration.

deviation from parallel lines in the position of the newer pillars in the nave." There could have been no careful examination, or the discovery of this secret chamber would have been made earlier. Rose had hardly completed the nave in his own way when PUGIN, who was in his combative youth, made it the subject of a fierce attack. It was an instance of what he called "the horrible repairs, alterations and demolitions that have taken place in our venerable edifices, ever directed by a tepid and parsimonious clergy, brutal and jobbing parochial authorities, and ignorant and tasteless operatives." *The Ecclesiologist* was no less severe, for in the first volume we have the following description of the renovated church in 1842:—

The nave of the church of St. Saviour, Southwark, has recently been destroyed, and in its place has arisen a structure in the modern Lancet style, composed of a nave and two aisles of equal height. The great south porch, although in a mutilated state, was of great value as an architectural example of Early English date; this, however, has been

most glorious. The east end of the nave is separated from the transepts by a slight partition of wood, against which the new altar is placed. Over the altar are perspective paintings upon the flat wall of four Lancet panels, in which are the Decalogue, &c., and above these five large glazed Lancet apertures through which a glance of the choir may be obtained; and to complete the whole a mean pulpit with its modern appurtenances is placed in front of this disgraceful altar. After this it will be unnecessary to say that a very striking contrast exists between the nave and choir. The tomb of the poet Gower was removed some years ago into the south transept, where it now stands with the head of the effigy northward. It is lamentable to think that an opportunity should have been lost which, if improved, would have rendered St. Saviour's Church second to none in London, except the venerable minster of St. Peter.

After such terrible vicissitudes it was impossible to deny that the famous church of St. Mary Overie, which history and legend superadded to art had made a glorious English memorial, was a thing of the past. The building, however, debased by meddling, served

THE LADY-CHAPEL IN 1834.

removed, although it does not appear that any inconvenience would have resulted from its preservation. The south side of the new nave is faced with flint and ashlar, but the north, not being so much exposed to view, consists entirely of brick. The splendid choir is now merely a vestibule, and the services of the church are conducted in the nave, the floor of which is now about 10 feet higher than that of the choir. The principal entrance into the nave is through a door lately made in the south wall of the south transept, from which one flight of stairs leads to the floor of the new building on each side of the new altar, and another to the east ends of the galleries, which occupy the whole width of the aisles as well as the west end. There are other entrances at the west end under the organ. The roof, which is intended to resemble a stone vault, is supported, or supposed to be supported, by two rows of shafts of about one-fourth the diameter proportionate to their height. The church is lighted by two rows of lancets; those above the galleries are all triple. Internally they have a very poor effect, being without splays or mouldings of any sort whatever. But the most miserable part is that which should have been the

for such uses as the good people of Southwark required. Year after year was allowed to run on without any vigorous effort to recall the appearance of the noble church in its palmy days. In 1877 the late Dr. THOROLD was appointed Bishop of Rochester. He was inspired to believe that the removal of Rose's nave was a duty which was incumbent on him. He was able to persuade many people to share in his eagerness, but it was not until 1890 that the financial arrangements could be completed. On July 24 His Majesty, then Prince of WALES, was able to lay the foundation-stone. Dr. THOROLD, to the regret of all who knew him, was destined to be among the men who die without being able to see the fruition of their labours. His spirit, however, still survives, and it may be confidently anticipated that whatever is necessary for the completion of the cathedral will be accomplished. The last restoration was entrusted to the late Sir ARTHUR BLOMFIELD, A.R.A., and his sons have charge of the building.

## THE EXPLORATION OF MEMPHIS.

THE appeal of representatives of the British School of Archæology in Egypt for funds to undertake explorations at Memphis may by some be supposed to resemble a great many other requests for money by archæologists. Every ancient city might easily be considered to present opportunities for increasing our knowledge, and the humble spade in the hands of native labourers has already accomplished so much, there is no reason why it should not lead to further discoveries. The operations on the temple sites at Memphis are estimated to cost about 3,000*l.* a year during fifteen or twenty years, while a clearance of the ancient capital would require about 500,000*l.* The sums may appear startling, but the object in view is well deserving of a costly enterprise for its attainment.

Every tourist who has visited Cairo could hardly escape from seeing the supposed site of the earliest capital of Egypt. As little else than several mounds are apparent, many people may imagine that the greatness of Memphis was no more than a myth which was not worth the trouble of investigation. Collections in museums present few objects which are suggestive of the wealth or dignity of the ancient capital. When MARIETTE undertook the systematic exploration of the Necropolis it was expected that many revelations would follow. Unfortunately he did not live to complete his work, and it may therefore be said that we still have to take the greatness of Memphis, as shown by works of art or industry, on trust. We can imagine that the early city was not surpassed by any of its rivals. But the site offers no evidence to support that view, and the ordinary visitor to museums is unable to see small or large objects from which he can draw conclusions about the people, who are said to have rejoiced in an advanced stage of civilisation wherever it came from. There was no place of equal note in the ancient world which has afforded so little for the amazement of posterity. What makes it more strange is that in the fourteenth century so many remains of ancient buildings were said to be visible there could be no doubt about the accuracy of the early descriptions.

Memphis is recorded to have been founded by MENES, who is believed to have commenced his reign 3,900 years prior to our era. Modern conclusions are in favour of the supposition of his reign beginning still more remotely. According to HERODOTUS, when MENES gained his power the whole of Egypt, except the part around Thebes, was only a morass. MENES, by raising embankments and forming channels for the river, anticipated the work of modern English engineers and the Egyptian Irrigation Department. When he had diverted the course of the Nile, says HERODOTUS, he built the city of Memphis within the ancient bed of the river and founded the magnificent Temple of Vulcan. It is also said he was able to excavate a lake or reservoir outside his city. The efforts of MENES were successful, for the Greek traveller was amazed at the fertility of the land, by which agriculture became a pleasure rather than a toil. He had 330 successors before his dynasty ended.

Some writers, from the resemblance of the names, have said that MENES may have been MINOS, who gained fame in India as well as in Greece. Whether this is more than a plausible theory cannot be determined, for up to the present no monument has been discovered to confirm the duration of the reign or even the existence of MENES. It is well to remark that DIODORUS ascribes the foundation of Memphis to OUCHOREUS. MENES, he says, was once saved by a crocodile in the lake Mœris, and in consequence erected Crocodilopolis, which apparently was very inferior to Memphis, which was under the protection of the god PTHAH or VULCAN, who was more powerful than a legion of crocodiles. From this it will be seen how much uncertainty prevails about the origin of the

city, and which can never be removed until some memorial has been brought to light.

Although the first dynasty lasted for 253 years, there is no monument known which recalls any of its other representatives. The pyramid of Sakkarah is supposed to be the tomb of a king of the second dynasty. On plan it is not a square and therefore does not correspond with the later pyramids. The door leading to the sepulchral chamber was carried off by LEPSIUS, who directed an expedition sent to Egypt in 1842, and it is now one of the treasures of the Berlin Museum. The chamber itself, it may be remarked, was lined with blue tiles resembling those made in Holland, thus showing that vitrified porcelain was known from a remote age in Egypt. The third dynasty was originally from Memphis, and it is believed that a bas-relief found at Wadêe Maghâra relates to one of the later kings. It represents the king holding a prisoner by the hair and about to strike him with a mace. Although coarsely executed it anticipates the representations of kings which were afterwards common. The Great Pyramids of Ghizeh are supposed to have been erected by two kings of the fourth dynasty, and the Sphinx belongs to the same period. In the course of three or four centuries various ways of erecting memorials arose and the Egyptian kings were not backward in using them. But they were mainly occupied with their own renown, and they adopted no means to glorify MENES, from whom they may have claimed descent. The first king might be only a fabulous being, and it would be a strange event if English labour demonstrated the truth of his existence as well as imitated his arrangements for fertilising the Nile Valley.

HERODOTUS when he visited Memphis took more interest in the country around the city, which recalled parts of Greece to him, than in the city itself. He imagined that the land at one time was covered by the sea, and he apprehended a time of great misery when the soil would be elevated and could not be watered by the Nile, especially as there was little rain to take the place of the river. About the city itself he says little. He refers to the magnificent Temple of Vulcan which MENES had erected and to which Mœris added a large portico. There is also mention of the palace of NITOCRIS, with its spacious subterranean hall, which she employed to drown her enemies. SESOSTRIS, who was a great builder, left memorials at which the Greek traveller wondered, but that ruler lived a thousand years after MENES and belonged to a different dynasty. In the Temple of Vulcan was a chapel dedicated to VENUS the Stranger, and HERODOTUS assumed HELEN OF TROY was celebrated under the title. He also relates the strange story of the treasure-house of RHAPSINITUS, which HEINE employed as a subject for one of his most irreverent romances. It is a curious legend, especially as suggesting the occasional mistrust of architects in the ancient days when Memphis was a great city. One thing is worth remarking, viz. that just as Mr. DICK, no matter what pains he took, could not prevent the head of CHARLES I. from coming into his memorial, in the same way the Temple of Vulcan is always cropping up in the narrative of HERODOTUS, which relates to Egypt. It might be not only the centre of Memphis, but Memphis itself. So many porticos were erected, that unless others were demolished to make room for them the temple must have appeared insignificant in the midst of such accessories. One monarch, after erecting a portico, is described as placing another spacious edifice with sculptured figures and colossi 12 cubits high in front of his addition. Another king placed before the temple a recumbent figure of 50 cubits, or 75 feet in length, with two statues standing near it each 20 feet in height. By the terms of the arrangement made with the English Government the British School is to have one-half of the sculpture which is found, and if they can secure some of the figures at which the Greeks won-

dered another enlargement of the British Museum will be inevitable.

DIODORUS wished to outdo his predecessor, and from him we learn that the circuit of Memphis was 150 stades, or over 17 English miles. He does not mention that it was surrounded by a wall, and the dimensions given may have included the suburbs. But the area is so large, the half-million pounds sterling for clearing the whole of the ground does not appear to be excessive. The size of the buildings is suggested by the fact that the enclosure of one of the temples was sufficiently large to allow of bull-fights.

The decline of Memphis dates from the time of the Persian invasion under CAMBYSES, or five centuries before our era. It was recognised as the nominal capital until the rise of Alexandria, which through the influence of the Greeks and Romans was better adapted to serve as the capital of a country which possessed a maritime trade. As in other places, the palaces and temples were in course of time used as quarries for the erection of meaner buildings. But it is not impossible that the drifts of sand to which the city was liable may have overwhelmed some of the remains, and that it was not considered worth the trouble to seek them with so much stone in higher places. In all explorations an element of speculation must necessarily enter, and the treasures of Memphis which have survived may not be worth the trouble found in seeking them. But in archæology it is well never to open a profit and loss account. Memphis is the last of the great fields which remain covered. Other countries have wished for the chance of making researches in it. To some extent it resembles the efforts to reach the North Pole. Success in such an enterprise is worthy of a great nation. Since Great Britain has undertaken so many offices in Egypt, there are reasons which make it incumbent that this country should also take up the noble task of revealing Memphis.

#### ARCHITECTS IN SOUTH AFRICA.

AT a recent meeting of the Transvaal Institute of Architects a paper on "The Qualifying Examinations in South Africa of the Royal Institute of British Architects" was read by Mr. G. A. H. Dickson, past president of the Transvaal Institute.

The Council, said Mr. Dickson, when discussing the syllabus of papers to be read, were of opinion that the subjects to be treated should as far as possible be of local interest, and treated from the standpoint of an architect practising in South Africa. It was not intended to encourage academic discussion on, say, the history of architecture, about which it is improbable, though certainly not impossible, that anyone of us could contribute any original information, although a thesis treating of the fundamental principles of our art viewed from a modern and local standpoint would be interesting. I certainly did not feel equal to anything of this sort. Most of such papers are culled from standard works which are open to us all, and are for that reason, as a rule, in danger of being intolerably dull. In my case I was not, as I say, prepared to deal with these subjects, and it occurred to me to take as my text the proposed compulsory examination of the Royal Institute, with which I am connected as chairman of the examining board, as it will offer an opportunity for discussing a subject of general interest to us all—the status of our profession in South Africa.

The announcement that the Royal Institute of British Architects intends holding an examination for membership in Johannesburg for South Africa is of interest not only to those directly connected with the architectural profession, but also to all classes of the community. The Royal Institute of British Architects was incorporated in the reign of William IV. by royal charter, in which it is set forth that it is for the advancement of architecture and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith; it being an art esteemed and encouraged by all enlightened nations as tending to promote the domestic convenience of citizens and the public improvement and embellishment of the towns and cities. Fellows and associates of the Royal

Institute are granted the right under this royal charter of using after their names the affixes that they do. The Royal Institute requires a high standard of technical and general education, and the tendency in South Africa must undoubtedly be for good, and will result in time in the raising of the standard of taste in architecture in this Continent.

After all is said and done, the public are, speaking generally, led by the profession, and their taste is formed to a great extent by what is provided for them, and by what they see around them in their daily life, rather than by any conscious effort of education. The stimulating effect on the profession therefore must mean a general levelling up of the popular taste in architecture and kindred subjects. This higher standard of education in the public and the profession will, we may confidently hope, prevent in the future many of the vulgarities in architecture for which the principal towns in South Africa are now unfortunately notorious. There can be no doubt that the profession in South Africa in the past has been discredited, and that architecture has suffered from certain nondescript adherents who have neither the technical training nor the general education which are necessary in this as in all other liberal professions. The effect of the proposed examination will be, in time, the elimination of these. It is to be hoped, therefore, that the Government and the Transvaal University College will be able and willing to collaborate with the Transvaal Institute of Architects in the cause of higher education in architecture in South Africa.

It would be a worthy object for one of our millionaires with wide artistic sympathies who has shown an appreciation of art, archæology and architecture in Europe, if he would espouse this cause in South Africa, and institute at the Transvaal University a chair of architecture. There is a chair of architecture at Melbourne University, and, of course, at various universities in England. A Bill has been prepared, and it is more than probable that in the near future it will be introduced in the Imperial Parliament, instituting some form of compulsory examination and registration of architects, as is the case in most other European countries, and these examinations by the Institute are preparing the way for such ultimate legislation. No doubt the colonies would follow the example of the home country in this matter, and the institution of this qualifying examination in the colonies is a step forward. No living or national architecture can be created in a country without a knowledge of the history and philosophy of the art, in addition to the technical requirements which are necessary in architecture in common with civil engineering. We hope that in time there will be developed in South Africa a style distinct and characteristic. We have conditions that require and suggest a departure from the European models, and there is undoubtedly a tendency among the more intelligent architects in South Africa to evolve designs, whether secular or ecclesiastical, that have some characteristic feature suggested by a wide knowledge of our art and an appreciation of our requirements.

With regard to the election to membership of the Royal Institute, it is open to the following objection:—There are practising in South Africa (and elsewhere) firms who are "reputable," but who are in the real sense of the word not architects or professional men, as the latter word is understood in other professions. Their work is in no sense architecture, although it satisfies the class for whom they cater, and their contracts are no doubt carried out in a businesslike way. These gentlemen are accepted at their own value as architects by the uninitiated, and we have no quarrel with them except that their work is too often a misfortune from an æsthetic point of view. There are others of this class practising who are ignorant of the elementary rudiments of engineering science, and cannot say what part of a roof is in tension and what part in compression. We have, as I say, no quarrel with these gentlemen and do not object to their practising, but it is most strongly contended that the exequatur of the Royal Institute should not be extended to them, although they may be practising reputably, as either class would bring discredit on the Institute as a professional body. We are here, perhaps more than elsewhere, constantly brought into contact with civil and mining engineers with high qualifications, and to them and other learned professions the fact that Fellowship of the Royal Institute does not preclude ignorance and absence of any professional training as understood in other professions is bound to have a most prejudicial effect on the standing of the Royal Institute in this country, and is, I venture to urge, most unjust to those members who have submitted to the educational tests of the Institute,

whose status is thereby impaired and whose claims to be regarded as members of a professional institute are liable to be questioned. We object to those nondescript adherents of the profession who only wish to cover their deficiencies with the cloak of the Institute, and whose inclusion in that body is, we submit, unfair to the members and to the reputation of the Royal Institute itself as an examining body, and would be, we think, undoubtedly misleading to the law tribunals and to the public, who cannot be expected to learn to differentiate between one class of Fellowship and another.

The Institute will in future not only insist on certain attainments, but, which is very important, they will put a definite face value on those attainments. Under present conditions a man may have had a most expensive training in his profession, but how are the public or the Courts to assess his value? A man cannot go about saying I was a pupil of so-and-so, the well-known architect, and my training has been of such-and-such a character. In my own case, I was a pupil of the late George Edmund Street, R.A., and of Sir Arthur Blomfield, A.R.A. When I went into the world, unless I had passed the Royal Institute qualifying examination I should for all practical purposes in the eyes of the public have been on the same footing as, say, the office-boy who was there at the same time, and who, as a matter of fact, is at this moment, I believe, practising in a small way as an architect in London. These are domestic details, but they serve to illustrate the necessity for our making an effort as a profession to get into line with the other liberal professions, one result of which would be the constitution of what I have called a face value, as in other professions, for men who have been through the prescribed preparation, and who have been successful in passing the ordained qualifying examinations of the profession.

That the existing condition of affairs has worked altogether unsatisfactorily I do not contend; it has perhaps played into the hands of men with well-known names, owing to the qualifications of the younger men having no official imprimatur and being an unknown quantity to the public. It is not contended that the Institute examinations will discover whether a man has the gifts necessary for a great architect; it only guarantees that he has the necessary technical and general education to enable him to practise. If it is thought desirable, in order to bring as many architects as possible under the ægis of the Institute in order to insure uniform practice, I submit that some different and clearly-defined class with a different denomination might be created, or that the honorary fellowship of the Institute should only be given, as it has been in Johannesburg, in cases of unquestioned eminence, on which point the whole of the members of the Institute practising in the country, wherever it may be, should be asked for an almost unanimous vote, which, although we are singularly free here from local jealousy, has many obvious difficulties. In order to meet these and other objections and difficulties in connection with the selection of members, the Institute are proposing to hold a special qualifying examination in the various parts of the British Empire. This does not, I admit, altogether cover the ground, as there are numerous gentlemen belonging to this Institute who cannot, for perfectly legitimate reasons, undertake to undergo this ordeal, but it is a step in the right direction, and will in time bring about a standardisation of recognised architects. The tendency to eliminate the nondescript adherent must be to raise the status of the profession in this country.

With regard to our position, I suppose I am within the mark when I say that some half-dozen leading members of our local Institute have had the spending of some millions of pounds since the war, money entrusted to them by the public. We project and carry through large schemes, from the initial stages to the most minute detail of the completion. This argues the possession of certain mental qualifications and exceptional organising power. We are, however, consistently overlooked by the powers that be when any public commission is appointed in a matter of importance, and we have not been asked to contribute or suggest a member of the Legislative Council. I think that as a profession we are too retiring and self-contained. I believe that a wise hospitality would advance our art and its recognition. The public hears too little of art and architecture. We should have an annual dinner, to which public men should be asked, as is done by most of our kindred societies. We should let it be seen that we are of some importance in the world as professional men, as business men, as scientists and also as artists. Architecture is an art that has always been esteemed and

encouraged by all enlightened nations; it has been taken as a gauge of the civilisation and culture in all times; it is necessary that we as professors of the art should see that it does not suffer from neglect and ignorance in South Africa.

It is surely nothing less than a national misfortune when public buildings are erected which are a travesty of our art, and when our suburbs, which might have been beautiful, and for which nature has done so much, are composed to such a large extent of the commonplace and drab type of house instead of the beautiful homes, either large or small, which it is proved are possible. The older suburbs of Pretoria, and a considerable part of our older Johannesburg suburbs, are full of examples of the baneful influence of the "nondescript adherent of the profession," and of an uninformed and uncritical public, who show an absence of any appreciation of the charm of simplicity, dignity or truth.

To revert to my text, it is certainly a most extraordinary anomaly that a mechanical engineer in a mine, and even a plumber, should have to pass an examination and obtain a certificate, while an architect can practise without anything of the sort. He can simply put up a board with "architect" after his name, and he becomes at once a member of the professional classes. Should he appear in Court his evidence is taken down by the judges as being expert technical evidence, when he may possibly know less of the subject than the man who is opposed to him. These gentlemen, to whom I referred as nondescript adherents of the profession, have no knowledge of the underlying principles of architecture and employ empirical methods, which are out of place in a profession. To remedy this state of affairs is the desire of all qualified men. At present, of course, it cannot be said that all members of the Royal Institute are qualified men, but the Royal Institute is slowly and surely achieving her object, which is that they shall be. Still less do I wish to seem to infer that the members of this Institute and others who in the past have for various legitimate reasons been unable to find time or have not had an opportunity of going up for the Royal Institute examinations are not fully qualified. I am dealing rather with the future of our profession and justifying the line taken by the Royal Institute in holding these examinations, and in making them a condition of membership, and also to justify the intention of getting a Registration Act passed through Parliament at an early date. How the desired end will ultimately be attained is not within the scope of this discussion; I merely wish now to point out that this is the end in view, and I think we all agree it is a desirable one.

#### GLASGOW SCHOOL OF ART.

THE new art school when completed will have, along Renfrew Street, a total length of 148 feet and a depth of 77 feet. The existing eastern section is 56 feet in height, but the roof is to be removed and an attic storey added, giving a uniform height over the whole extent of the building of 72 feet. The frontage to Renfrew Street is a continuation of the design of the eastern section, but the western elevation to Scott Street will form a special feature. At the south-west corner of the building on the second floor the library is situated. Here the building rises to a height of 100 feet, and the wall will be broken by the library windows, 20 feet in height, between which will be placed a series of emblematic figures, representing art, sculpture, architecture and music. The basement floor of the building is set apart for the modelling school and a series of technical studios for metalworkers, wood-carvers and enamellers, book-binders, house decorators, &c., and there is a sub-basement, in which there are rooms for stone-carvers, pointers and casters. The modelling school measures 120 feet by 48 feet, and has elementary, advanced and life classrooms. Altogether on the basement floor there is accommodation for about 200 students. The life modelling-room is lighted from the roof and is 30 feet in height, an all-important matter in connection with colossal statuary, as the largest piece of sculpture may be worked inside and a number of students employed upon it. On the basement floor there is also a lecture theatre, seated for 150 students, with an independent entrance from Scott Street. On the ground floor are situated the still life and architectural schools. The ornament and still-life classes occupy the corresponding floor of the eastern section, and this portion of the new section, which will accommodate about 200 students, will be set apart for the architectural school. Passing to the first floor,

there will be here also a rearrangement of classes. The eastern section, when the building is completed, will be given over entirely to the antique school, and in the new or western section will be the life school, the school of design, a large and finely-lit museum, a school library, and the head-master's private room and studio. The life school measures 120 feet by 35 feet, with a height of 28 feet, and it will accommodate about 150 students. It is splendidly lighted from the front, and it has also roof lights, the second or attic floor being recessed about 10 feet to permit of this arrangement. The library is a handsome apartment, 35 feet square and 28 feet high. The bookcases are so placed that there will be recesses all round the room, giving ample opportunities for private study. Adjoining the library is the librarian's room. The second or attic floor will be appropriated entirely for studios. In the new section there will be five private studios for professors, while in the old section over the existing building there will be nine studios for advanced students or for artists visiting the city. Hitherto there has been a lack of facilities for artists from a distance who might desire the use of a studio temporarily to do some special piece of work, and the arrangement to be made in the school of art, when it reaches completion, will be a great convenience to such visitors. Classrooms for flower painting and composition will likewise be provided on this floor immediately over the library, and connected with these rooms will be a conservatory with light from the south-east.

Sixty-seven years ago, in the upper rooms of a house in Ingram Street, at the foot of Montrose Street, diverted for the time from its purpose as business premises into a medium for the study of other arts of peace, the Glasgow School of Art started on its career. And there are not a few among the older citizens of Glasgow and the neighbourhood, says a correspondent of the *Glasgow Herald*, who can still recall, with a sense somewhat of physical discomfort, the cheerless wintry mornings that saw them wending their ante-auroral way to receive those lessons in drawing which, though rigorous and circumscribed in dexterity, were yet in certain instances to prove of fruitful issue to the recipients, and in all cases to serve as an incentive to further progress and to higher and more purely artistic attainments.

For from this humble beginning, in these chilling yet courageous circumstances, the Glasgow School of Art has grown in power and broadened in development, until the stately but utilitarian building pictures the present ideal which those charged with the care of art education in the Western Metropolis have decided to complete, in order to satisfy the demands of a school whose pupils are as numerous and as earnest as those of any art institution in the three kingdoms, and whose work is receiving a recognition that begins in Glasgow but extends among the majority of civilised communities. The strength of the school has grown with the recognition of art as a vital factor in the commercial and social life of the city. It was the foresight of a few of the leading citizens of Glasgow, interested in art education, that gave the institution its birth. Just as a small body of equally intelligent civic fathers saw in the MacLellan collection of pictures the nucleus of the present famous gallery of paintings, and as the Municipality has just crowned their art collections by building in Kelvingrove Park a palace fit to contain such treasures, so have the citizens and the State combined to erect an institution wherein the sons and daughters of the citizens of Glasgow may receive an art education rendering them capable in the present of appreciating art, whether pictured, carved or manufactured, and possibly give to certain of their number that cunning of hand that may either enable them to add their picture or their sculpture to the galleries, or widen that knowledge of design and application that shall enrich the product of the factory and of the workshop. Certain it is that it is long since Glasgow relied upon any hands other than those of her own artists to place her among the art centres of the world, and just as surely it is that designers working in Glasgow are capable of more than holding their own among the demands made by the world's markets. In the education alike of painter, designer and craftsman the Glasgow School of Art has played an important part, and the governors, fully alive alike to the needs of the hour and the question of future developments, have met the responsibility committed to their charge with commendable fulness of thought and action. Their untiring efforts to make the school in every way a success have been munificently acknowledged by the State, acting through the Scotch

Education Department, and as equally responded to by the Municipality and by the growing circle of warm-hearted friends interested in the work and development of the school.

The building, whether studied internally or viewed from the outside, may be said to be, in more senses than one, the latest development in architectural thought, but when all is said and done there is little doubt that as a workshop it thoroughly meets all demands, and the six years that have been spent in the portion now standing have found out new faults in the outer structure or in the inner arrangements. So much is this the case that the new half is virtually to be a repeat of that now standing. Certain changes in external treatment appear, but the spacious, well-lighted rooms that now exist are to be repeated, and the whole building when completed, will be another noteworthy addition to the wealth of architectural art in Glasgow. The design is from the firm of Honeyman, Keppie & Mackintosh, the work being carried out under the personal supervision of Mr. Mackintosh. And it may be, perhaps, a practical testimony to the character of the education given that Mr. Mackintosh is an artist who received his early training in the school, and who by this, his latest work, adds to his reputation as an architect, and gives an added lustre to his Alma Mater. Living and working in the school as a pupil, and having a knowledge at first hand of the requirements of an art school, Mr. Mackintosh has conceived these requirements as from the inside outwards, and he has embodied his knowledge and experience in a building that sums up the necessities of the art education of to-day in a spirit that testifies to the beautiful in the essential.

#### CONSTRUCTION OF FIRE STATIONS.

AT the meeting of the London County Council on the 18th ult. a question was asked whether there was an excessive amount of steel used in the construction of the Council's fire stations. The fire brigade committee have inquired into the matter. The steelwork in fire stations is, they are informed, designed as far as possible upon the basis of the following loads and working stresses, viz. :—The maximum stresses allowed in the steel are 7 tons per square inch for exposed girders, and 9 tons per square inch for steel joists and girders embedded in concrete. The portions of steelwork in the fire stations which would be likely to appear to an observer to be excessive generally occur at the first-floor level over the appliance room. Here somewhat heavy girders are necessary owing to the exceptional loads which they have to bear as the result of the special planning required in the case of a fire station. The appliance room usually occupies the greater part of the area of the ground floor, and has to be kept as free as possible from piers and walls, and practically the whole of the frontage of the room is required for the run-out from the station. Provision has therefore to be made for carrying the greater portion of the upper structure (which is divided into small rooms), consisting of floors, walls, partitions and chimneys, and most of the steelwork is thus concentrated at the first-floor level. In some of the fire stations the supporting power of the central pier at the run-out is ignored in order to allow for its removal, and in certain stations provision has been made for building an additional storey whenever required, and the weight of this would have to be carried by the main girders.

In the new Tooting fire station the main girders extend over three spans, and were originally designed as plate girders, but the steelwork contractors in order to expedite delivery offered to supply heavier girders from their stock without additional cost to the Council, and this offer was accepted.

The Right Hon. Charles Booth has addressed the following letter to the Chapter of St. Paul's through the Archdeacon of London :—"I have already expressed to you privately my wish to present to the cathedral the picture by Mr. Holman Hunt entitled *The Light of the World*, and I would now beg you to be so good as to bring my offer formally before the Chapter. My wish and that of Mr. Holman Hunt would be that a place should be found for the picture in the body of the church, so as to be readily seen by those who come and worship there." This munificent gift has been gratefully received by the Chapter. The picture is on its way home from its journey round the world, and will not be placed in the cathedral before October.

## NOTES AND COMMENTS.

IN modern exhibitions examples of French art are considered to be essential. But the artists who contribute works no less than those who are not invited to contribute are often dissatisfied with the results. If there are sales they are found to be subjected to unexpected commissions and many other grievances arise. In order to obviate disappointments which have been too common a committee of leading artists was lately organised, and this permanent committee of fine arts will be responsible for the arrangement of the French section in foreign exhibitions. M. BONNAT was unanimously nominated as president and has accepted the office. The vice-presidents are M. BERNARD, the painter, and M. MERCIÉ, the sculptor. There are special committees to represent architecture, painting, sculpture, engraving and etching, and decorative arts. The members of the architectural committee are MM. DE BAUDOT, DEGLANE, GUILLEMONAT, LALOUX, MOYAUX, NORMAND, PLUMET, RAULIN, VAUDREMER. With so many zealous artists to control exhibitions the objections of many French artists will be removed and the public in general will be gainers.

AFTER spending three months in Buenos Ayres M. BOUVARD has returned to his duties in the Hôtel de Ville, Paris, where he directs the services of architecture. He was solicited to visit the capital of the Argentine Republic in order to suggest the works necessary to place it on an equality with the European capitals. Never was a projector less hampered. M. BOUVARD might be a magician, and the authorities, his faithful servants, were prepared to do whatever he commanded. Apparently the positions were reversed. The citizens of Buenos Ayres saw only wide thoroughfares and splendid buildings. It was the architect who had to put a check on their imagination by explaining the cost of improvements. M. BOUVARD has prepared a scheme which reveals what is possible in the course of several years if money is forthcoming and the inhabitants continue to be enthusiastic about building. But he has prepared other plans which are limited to the works which should be commenced without delay, and which will be an earnest of those which are to follow. Two of M. BOUVARD's assistants will remain in Buenos Ayres in order to superintend the works and to keep him informed of the progress of events. Next year M. BOUVARD will again visit the South American city.

THE clergy are bound to set an example of reverence for the Sabbath. We may therefore take it for granted that when they learn from the latest report of the Tariff Commission that the stained glass which is imported in such large quantities from Belgium and Germany is in part a product of Sunday labour they will cease to give orders to foreigners. Complaints have been reported about the glaring colours and the unfitness of the treatment for quiet English churches without avail. But possibly the breach of a Commandment may have more effect on the clergy. The high tariff, which amounts to 45 per cent. of value, has diminished the trade between this country and the United States in stained glass. The duty in Canada is likewise so high, less glass is exported to the colony than formerly. An architect and surveyor informed the Commission that the cheaper and thinner grades of glass especially are derived very largely from foreign importation. The superior kinds hold their own much better, though even "British" plate is made abroad and sent here. Difficulty and cost of transit seem the only important bar to heavy dumping. Certain kinds of glass for the lining of walls in lieu of glazed tiling are arising in considerable quantities. A variety of suggestions are made in the evidence in the way of remedial measures,

the prevailing opinion being in favour of a change in the British fiscal system to equalise conditions in the home market, to secure fairer treatment in foreign markets, and especially to encourage trade with what are regarded as the most promising export markets for the glass industry, namely, those of the British colonies.

THE biennial prize of 12,000 francs founded by the late Baron ALPHONSE DE ROTHSCHILD will next year be awarded for the first time. It is intended to encourage a French artist having merit, or as a recompense of an artist's career, and the Académie des Beaux-Arts will be the judges. Their awards for other prizes which were available this year have been announced. M. LEPORT-MAGNIEZ has gained the Maurand prize of 1,000 francs destined for a young landscape-painter. One founded by HENRI LEHMANN of the value of 3,000 francs for painters who are under twenty-five years of age was divided between M. URBAIN BOURGEOIS and M. ANDRÉ LEROY. M. RASET has gained the Prix Deprez of 1,000 francs for sculptors. The Prix Brigard valued at 3,000 francs for a marine painting was awarded to M. ALFRED STIVAL. The prize Maxime David of 400 francs for miniature painting falls to Mlle. JEANNE BURLY. Another prize worth 2,000 francs, offered for a painting of a nude baby from eight to fifteen months old, was awarded to M. GUEDY. A prize of 3,000 francs to recompense a painter without fortune was bestowed on M. BALANDE. For the Prix Ary Scheffer of 6,000 francs for an engraver M. LAGUILLERMIE was the successful applicant.

ACCORDING to the Greek legends the venerable NESTOR, whose name is likely to live for ever as the designation of a wise and faithful councillor, was born in Pylos. Old as he was he took a prominent part in the Trojan war, and when it was over the gods who favoured the Trojans did not interfere with his voyage homewards, and he is supposed to have continued his rule for several years in Pylos. Whereabouts in Greece was his city? It appears there were three towns which bore the name, and the ancient geographers could not decide in which of them NESTOR reigned. In modern times it was thought to be Navarino Vecchio. Dr. DÖRPFELD has been superintending explorations on the supposed site. He discovered a vaulted grave of the type of those in Mycenæ, which was approached by a tortuous passage. Apparently the researches were anticipated some centuries ago, for the vault or treasury had been cleared of its contents. All that could be discovered was a very small figure of a frog in gold and a few vases which in style had some resemblance to those brought to light at Knossos by Dr. EVANS. The masonry of the walls was not of a high class, and at present there is nothing to justify HOMER's description of Pylos as a well-built city, which was a common expression with him. But it is hoped that when the exploration is resumed in the autumn there will be more success.

ALTHOUGH *L'Art* has no longer the benefit of the guidance of the regretted PAUL LEROI, the new number must be considered satisfactory by the subscribers. An etching of a child by M. WALTNER after PAUL DUBOIS is a characteristic example of that master's vigorous treatment. There are also six phototype plates after different masters. Articles appear on LANCRET, the painter, CHALLAMEL LECOUR, the publicist, Early Salon Exhibitions, German Art in the Eighteenth Century (with reproduction of the lithograph of GOETHE by DELACROIX) and other subjects. Under the new management the reputation of the periodical acquired during twenty-seven years will be sustained.

## ILLUSTRATIONS.

MANCHESTER ROYAL INFIRMARY.

THIS illustration is reproduced from the drawing now in the Royal Academy, and shows the administration blocks of the infirmary at present in progress under the direction of Mr. EDWIN T. HALL and Mr. JOHN BROOKE. Plans and elevations of the buildings represented appeared in *The Architect* for January 4, 11 and 18 of the present year. The institution is to be completed next June and nearly all the buildings are already roofed in. The contractors are Messrs. ARNOLD & SONS, of Doncaster, and the clerk of works, Mr. A. TURNER. Among the sub-contractors are—The Trafford Park Steelworks, Ltd., iron fire-escape staircases; Messrs. E. HEATON & SON, boilers and fittings; Messrs. J. & E. HALL, LTD., refrigerating plant; Messrs. GODDARD, MASSEY & WARNER, disinfectors; Messrs. MELDRUM BROS., LTD., refuse destructor; Mr. GILBERT SEALE, carving; Messrs. JAMES SLATER & CO., kitchen fittings; Messrs. D. & J. TULLIS, LTD., laundry fittings; Messrs. VINCENT ROBERTS & MAN, drying machines in laundry; Messrs. MORRIS & SON, fire hydrants, &c.

NEW GOVERNMENT OFFICES: PARLIAMENT STREET FRONT.

THE remarkably fine block of new Government offices which face Parliament Street, Westminster, is now approaching completion, and we are therefore enabled to give an illustration of the same. The exterior is all of Portland stone. The sculptors of the pediment are Messrs. HORSEMAN & GUNTHORPE, while the carvings on the archway facing Charles Street, as well as the keystone heads and panels, were done by Messrs. FRITH & CO., and the capitals of the columns are by Messrs. DAYMOND. The roof has been covered with Limmer asphalte, and the Fletton bricks to the number of nearly 20 millions were supplied by Messrs. HICKS, GARDENER & CO., of Peterborough. Altogether there were about 28 millions of bricks utilised.

The joinery is of teak and oak, and pitch-pine blocks have been used for flooring. The mosaicwork has been executed by the Mosaic Marble and Tile Company and Messrs. DIESPEKER, LTD. The plastering-work is by Messrs. A. & S. WHEATER, the tiling by Messrs. CARTER & CO., of Poole, and EDWARDS, of Ruabon. Mr. W. E. BONE is responsible for the plumbingwork, and the ironwork has been supplied by Messrs. DORMAN, LONG & CO. The staircases and steps are of hard York stone, supplied by Messrs. J. BROOK & SONS, Halifax. The lavatory basins were by Messrs. G. & D. MUSGRAVE, Horwich, Lancs, and the urinals and closets by Messrs. DOULTON, of Lambeth. The sashweights, of which about 75 tons were used, are from the Carron Company. The heating has been carried out by Messrs. STRODE & CO. The contractors for the whole work are Messrs. SPENCER, SANTO & CO., and the architect was the late Mr. J. M. BRYDON. We may add that the manager of the works is Mr. P. H. PATTEN, and the clerk of the works is Mr. SEARCHFIELD.

THE NEW ROYAL LIVER BUILDINGS, LIVERPOOL.

WE publish this week an illustration of the important building designed as a substitute for the Tower Buildings which now exist at the bottom of Water Street, extending towards St. Nicholas Church. As the view indicates, there will eventually stand in this important thoroughfare a building of imposing proportions calculated to dwarf any other building in the city devoted exclusively to mercantile offices.

It has for some time been recognised that the buildings have been unsuitable to present-day business requirements, and with their numerous awkward staircases and no lifts communicating with the different floors they are considered out of date. Baron GLANUSK, for this reason, some time ago decided that the whole of

the existing buildings should be pulled down and a building of a modern character erected in their place, adhering still to the same name, and thus maintaining the traditional interest attaching to the historic associations already referred to. As emblematic of this it will be noticed that a tower occupies a prominent position on the top of the building.

According to PICTON'S "Memorials of Liverpool," the site of Tower Buildings during the early years of the nineteenth century was occupied with a grim-looking, castellated structure, the "Tower" of Liverpool, which in the olden times was the fortalice of the Earls of DERBY: indeed, its history is closely connected with the fortunes of the STANLEYS of Knowsley. For many years it was the seaside residence and embarkation place for the Isle of Man and Ireland for the DERBY family. During its later years the ancient structure was used as a common gaol, and notwithstanding the erection of the new borough gaol in 1786, the old Tower continued to be occupied both by felons and debtors down to July 1811. It then remained unoccupied until 1819, when the building was pulled down for necessary improvements in Water Street, and the materials were sold by auction for 200*l*. During the sailors' riots in August 1775, some of the rioters were secured and lodged in the old Tower. A mob of about 2,000 men assembled and attacked the gaol, which surrendered at discretion, and the prisoners were carried off in triumph. At one period, balls and assemblies were held in the ancient chapel of the Tower. Those whose business takes them to the offices in Tower Buildings may have seen on a stone tablet on the south wall of the inner quadrangle the following inscription:—

Has Aedes  
Situm olim castelli  
Comitum de Derby  
Denuo construxit  
Negotiis pacisque artibus fovendis  
Dedicavit  
Jos. Bailey Eq. Aur.  
Anno Salutis MDCCCLVII.  
Architecto J. A. Picton.

The new colossal pile will rise up eight storeys in the main body, and eleven storeys with the tower. The building altogether will cover a site of half an acre, the whole of the ground floor, having that great area, being already taken by the Booth Steamship Line, James Street. This will rank as perhaps the largest single office in Liverpool. Half the first floor will be occupied by the Ellerman and Hall Steamship Lines, which are located in the present building. Messrs. F. H. POWELL & CO., shipowners, will have a suite of offices on the second floor, and many of the present tenants will again be seen in the new premises. The height of the structure to the top of the main tower will be 152 feet, compared with 136 feet, the height of the existing tower. There will be three public entrances—one in Water Street, one in the Strand and another from the churchyard—and inside the building there will be three main staircases, and four lifts. The premises will be lighted with electricity, and heated throughout by the landlord. Whilst architecturally the building will be of handsome and striking appearance, light and utility are the main features of the design. It is expected to be ready for occupation in the year 1908. An arrangement has been come to whereby the lessees, in return for the permission of the Corporation to the absorption of a portion of Prison Weint in the building site, will give up the portion of the site required for the widening of Water Street. This will constitute an important public improvement, allowing more room for the electric-car and vehicular traffic, which is constantly pouring into Water Street from the pierhead and the docks.

The architect for the new building is Mr. W. AUBREY THOMAS, State Insurance Buildings, Dale Street, Liverpool, to whom we are indebted for the photograph.

CATHEDRAL SERIES.—SOUTHWARK: VIEW OF EXTERIOR.

## URBAN AND SUBURBAN PLANNING.\*

IT is still a somewhat new idea in England that a city can consciously assume a beautiful shape, though this Conference is a good witness to the strength of the idea now that it has been born among us. In England we have too long looked for beauty in towns as a kind of accidental by-product brought about by the fortuitous combination of age and situation. Given a new manufacturing town in the centre of a flat expanse of country, we at once imagine it of necessity some hideous thing to be shunned by all except those unhappy ones who are compelled to spend a portion of their lives within its gates. As such towns are usually constituted by sheer haphazard the feeling is a very natural one. Yet such a town presents the easiest problems in symmetrical and monumental planning—the type of planning suited to a plain.

There seem to me to be two chief reasons to account for the fact that in this matter we, in the nineteenth century, fell so far behind our continental neighbours. The first, which is still with us and may be always so, is the average Englishman's desire to get rich quickly and shut himself up in his own castle, careless of the community which has helped him to achieve his ends. The second, which is slowly disappearing, was that every cultured person in the latter part of the last century suffered from a surfeit of the picturesque. The Gothic revival in architecture, the romantic spirit in literature, the teaching of Mr. Ruskin and the works of the pre-Raphaelites all led in this direction and did infinite harm to the dignity of our towns. I suppose since the beginning of the last century no square or circus or any other symmetrical place of any importance has been laid out in any English town, and yet it is only with the use of such forms that the finest architectural effects are possible. It must not be imagined from this that there is no scope for the picturesque or romantic in civic architecture. The very supposition is absurd. The real fact is that the picturesque is properly inherent in the site and cannot be artificially brought about. It would, for instance, be impossible for Edinburgh with its rock to be anything but picturesque. But on a plain the right treatment of plan is a broad symmetrical balancing of effects, the type of plan which is in essence monumental and classical. This was the kind of plan Sir Christopher Wren first suggested in England after the Great Fire of London, of which the best English example is the city of Bath, laid out in the eighteenth century by the Woods, father and son, the architects of the building we are occupying at the present moment. In the nineteenth century Paris is the obvious instance.

If, then, it is conceded that this is the spirit in which we should plan the level and principal portions of the town, it follows as a necessary corollary that the planning of such new parts or the alterations of existing parts must be consciously directed towards some definite scenic effect. The direction of the main thoroughfares can no longer be dictated by that of the primitive sheep track. It means further, that in these portions of the town the scope of the individual builder must be limited for the public good. In the picturesque portions the reverse is the case. Here the very individuality of the buildings enhances the picturesqueness. We all know the charm and romance conveyed by the varying outline of roof upon roof as buildings climb a hill. To prohibit variety of form and colour would here be to lessen the beauty of the town, not to increase it.

In the last century in England we carried our individualism through our towns from end to end, respecting neither our neighbours nor the general good. It was possible less than ten years ago for Nash's fine architectural scheme in Regent Street to be broken up by two odd and ugly domes erected to advertise certain shops. It is still possible in Liverpool to introduce a yellow terra-cotta dressed building into the quiet dignity and repose of Rodney Street, for it has unfortunately been done. Castle Street, too, which had the makings of one of the finest streets in England, though in our happy-go-lucky way it just manages to miss being centred on the domes of the custom house and the town hall, has never maintained the example of dignity and stateliness set by these two buildings and by Cockerell's Bank of England. Good as the street is by its width and position, how much better it might have been were the buildings on either side of one height and one material, not to mention the more debateable point of one style.

While, however, this riot of individual fancy and individual advertisement was playing havoc with our modern English towns, France was laying out, not only in Paris but in all her provincial centres, broad streets and boulevards on architecturally conceived lines. By this I mean streets which had some architectural relation to one another, being either focussed at some important centre or having their vista closed by some monumental building. The broadness of effect was certainly obtained in the majority of cases at some sacrifice of the picturesque, but sufficient old and irregular streets remain in Paris round Notre-Dame or give varied outline to the Montmartre Hill to even enhance by contrast the grandeur of the great boulevards.

The lesson for us is that this could only be consciously brought about by strict building regulations which took into consideration other things beyond hygiene and the public safety. To increase the beauty of the town was the patriotic duty of the municipality and the rights of individuals were curtailed for this end. French and lately American towns have, in fact, lived a conscious regulated life, while our towns as towns have in this respect slept. The result of this foresight, as of all foresight in such matters, has not only been an increase in dignity and beauty, but, if Paris may be taken as typical, an increase in material prosperity as well.

It may be useful then to state in general terms the way in which these results have been brought about and to see if the same methods could not be adopted here.

The first main distinction between Parisian methods and ours is that in Paris all schemes involving in any way the beauty of the town, whether they be for the laying out of new streets, the drafting of new building regulations, or merely the decoration of some public building, are reported on by specially appointed commissions of experts assisted by the permanent officials. It has become an honour for any artist, whether he be an architect or painter or a sculptor, to serve on these commissions and give freely and without remuneration the best of his ability to the public service. For instance, the Paris building laws were revised in 1896 on the report of a commission which consisted of the following persons:—Two municipal councillors, the official who corresponds to our building surveyor, the chief of the department which deals with building lines, the chief engineer, the chief inspector and the honorary architect to the town of Paris, that is, seven official personages. So far it might have been an English departmental committee. But here is the difference, in Paris sixteen other outside architects of distinction were added so as to insure to the town the best ability, which is not generally willing to submit itself to the trammels of an official position. Such a commission it will be at once seen would possess enormous weight. It dared to legislate on many other matters besides those affecting the health and safety of the public. It imposed a large number of restrictions on buildings which we have not arrived at in England, but it did them with knowledge of the effect to be produced. To take an apparently small matter but one which has been large in the result. As in Edinburgh and London, though not yet in Liverpool except for domestic buildings, the limiting height of all buildings in Paris is proportioned to the width of the street, but in addition to that the roof is to be contained within a quadrant of a circle of given radius. The result of this simple regulation has been to bring about a striking uniformity of roofs, which is most important to the regular and monumental appearance of a street, for in a wide thoroughfare it is the masses of roof seen against the sky which are the dominating features of the façades. The Avenue de l'Opéra and Rue de Rivoli are good examples of this. Another by-law, more strictly dealing with projections over the public way, has led to the flatter and quieter treatment of town fronts which is so characteristic of a French town. But granting the existence of such a commission as I have related above, it is possible for the municipality to exercise a much greater control over buildings than it exercises already, and to definitely prohibit buildings of bad design, as well as to encourage good ones.

In Edinburgh, where the Guild Court, which is largely composed of architects, controls all building operations, the designs for the exterior of buildings about to be erected have to be submitted for approval together with a statement of the materials to be used. Edinburgh can thus control the appearance of its streets in a way neither Liverpool nor indeed any other English town can. But Brussels and Paris go much further than this. When a new street is to be opened up they offer definite encouragements to good building by awarding prizes for the best designs for the buildings

\* A paper by Professor C. H. Reilly read at the City Beautiful Conference, Town Hall, Liverpool, on Thursday, June 27.

about to be erected in it. Paris even not only gives a prize to the architect but gives a remission of part of the street tax, that is, of the rates, to the owner of the building. No such direct encouragement to build beautifully has ever been proposed, as far as I am aware, in England, nor would it be much use unless we accepted the system of trusting the awards to juries of experts. In England the building by-laws are drawn up and administered by lay bodies, assisted by officials who in most cases make no claim to be architects or to have had any education in the fine arts.

But if this question of expert advice is necessary in dealing with the details of buildings, how much more necessary does it become when a big improvement scheme is projected. For consider what the cutting of a single new street in a town involves, in addition to the sewerage, the lighting and paving, for which the borough engineers and surveyors are the proper authorities. The intersections the new street makes with every cross street mean important building sites, and the shapes of these sites determine for ever the shapes of the buildings to be put upon them. Are they good shapes, conducive to beautifully-shaped buildings? For it is not a sound canon of architectural criticism to say of buildings, as was once humorously said of the University Buildings in Liverpool, that we greatly admire them, but much dislike their shape. The ground plan of a building is its most important factor. Will the sites provided make balanced, symmetrical, dignified buildings? These are all questions, I submit, of a purely architectural character, and the city beautiful of the future depends for its existence on the solutions arrived at, and as such they are as important as those problems of traffic and sewerage which have till now completely held the field.

We are having at this very moment in Liverpool a striking example of the simple disaster which follows the neglect of these questions. The famous George's Dock sites are, it will be admitted, among the most important in the town. They stand at its very gates and a worthy treatment of them should have been the town's first care. Yet the shape and size of these three sites has been determined solely by the carrying through to the river front of Water Street and Brunswick Street, regardless of the fact that the sites so left are of most unequal shape and size. This being so, we are beginning too late to realise that we can never have a balanced composition of the three buildings such as the position demands, and it is consequently rather useless now to complain of one building being higher than the rest. Again, there being in existence no architectural scheme for the whole, we find the Dock Board on one of the end sites putting up a building with a very dominant dome led up to by lesser ones, which is essentially the type of building to form the centre of a composition, not one of the wings. I do not know in this case what difficulties, if any, there were in the way of laying out these sites in an architectural manner. If, for instance, it were necessary for Brunswick Street and Water Street to be carried through, why the buildings on the river front could not have been carried over them on arches or with a colonnade; but whatever the difficulties were, I feel in France a proper architectural solution would have been obtained even at the cost of a short Act of Parliament. The best architecture can now never make a success of these sites, though beautiful materials and good detail may alleviate the disaster.

In London we have recently had an example of the opposite method of dealing with town property—the French method, if I may call it so, though it was the English method too from the time of Wren till the end of the eighteenth century. The Crown, in dealing with its Piccadilly and Regent Street property, have formed just such an advisory committee of artists as is commissioned in Paris. Two leading independent architects—Sir Aston Webb and Mr. Belcher—were asked to form a committee to join Sir John Taylor, the official architect, in advising the Crown. The result has been that, after a century of individualism, we are to have once again a complete scheme of harmonious architecture from one end of a street to the other.

Perhaps enough has been said for the establishment of advisory committees of artists. When once established, and if the municipality at its back is endowed with sufficient power, everything becomes possible. To begin with, an ideal plan of the city—ideal only in the sense that it is waiting to be realised—such as Washington and Boston already possess, should be drawn up, towards the ultimate realisation of which all improvement should lead. If Wren's for London, after the Great Fire, had been adopted how many expensive latter-day improvements would have been forestalled. As in Berlin, certain districts could be

set apart for certain purposes. The development being no longer haphazard the character and consequent value of districts could be maintained. Just as much or just as little variety as the district requires could be allowed to buildings, and not only buildings and streets but whole districts could be made parts of one harmonious composition. But the possibilities are endless. The one thing necessary for a city, as for an individual, is to have faith, and all else is added to it.

#### HOUSING OF THE WORKING CLASSES.

A PAPER was read before the Conference of the Royal Sanitary Institute, Dublin, by Mr. P. C. Cowan on "The Economic Housing of the Working Classes in Town and Country." He directed special attention to what had been done in Ireland. The waste of capital and revenue involved in the conditions of life in slums or insanitary hovels was now being generally recognised, and the perils to all classes of the community caused thereby had become manifest. Professor Koch said:—"It is the overcrowded dwellings of the poor that we have to regard as the real breeding-places of tuberculosis; it is out of them that the disease always crops up anew, and it is to the abolition of those conditions that we must first and foremost direct our attention if we wish to attack the evil at its root and wage war against it with effective weapons." The first Labourers (Ireland) Act was passed in 1883, and at March 31, 1906, 20,634 cottages had been built, and 887 were in course of erection. For these cottages loans amounting to 3,415,280*l.* were sanctioned, equal to about 159*l.* per cottage with plot. These loans were repayable by an annuity, covering interest and sinking fund, of 4*l.* 17*s.* 2*d.* per cent., with a period of fifty years. By the Labourers (Ireland) Act, 1906, a great improvement in the financial facilities for building cottages was effected, and the District Councils might now obtain loans not exceeding, in all, 4,250,000*l.*, repayable by an inclusive annuity of 3½ per cent., and the Government had undertaken to pay 36 per cent. of the loan charges, so that only 64 per cent. of 3*l.* 5*s.*, or slightly less than 2 1-12 per cent., would be payable by the District Councils for interest and repayment of the loans, for which the period was 68½ years. During the passage of the Bill of 1906 it was stated that the cost of a cottage and plot should not exceed 170*l.* On this assumption the 4½ millions made available should provide for the erection of 25,000 cottages with plots. With a rent of 1*s.* 3*d.* a week for a cottage and plot costing 170*l.*, a deficit of 5*l.* 0*s.* 2*d.* on loan charges alone was inevitable until the Act of 1906 was passed, but, under the terms of the Act, a similar deficit of only 5*s.* 9*d.* per cottage would fall upon the local rates. Up to 1906 only about 2 per cent. of the total number of cottages were erected in Connaught, and less than 10 per cent. in Ulster. In the latter province a number of cottages with weaving-room attached have been erected for hand-loom weavers of linen. The rents now charged throughout the country for a cottage and plot of at least half an acre, provided under the Labourers (Ireland) Acts, varied from 6½*d.* to 2*s.* 6*d.* per week, the general average being 11*d.* a week. Until the present year designs for cottages under the Labourers (Ireland) Acts were prepared by architects for the local authorities, in accordance with simple general requirements framed by the Local Government Board; but, in accordance with a somewhat general desire, the Board has now issued a set of eight plans for homes with three or four apartments, and a general form of specification which contained a number of alternative clauses to suit varying local conditions. Four of the plans were obtained by means of an open competition, the terms of which called for a kitchen and three bedrooms, an open shed and simple pail closet, a height of ceilings on the ground floor of 8 feet, and a minimum net cubic capacity in the apartments of 3,300 cubic feet, at a cost not exceeding 130*l.* Two enterprising firms of contractors had erected for the home industries committee at the Irish International Exhibition cottages on the designs which obtained the first and second prizes in the competition. He understood that these firms were prepared to erect cottages according to the prize design, with or without slight modifications, for a price closely approximating to the sum of 130*l.* already referred to. In Ireland, as might be expected, the operations of the sanitary authorities as to building houses under the Housing of the Working Classes Acts had not been very extensive, though the attention of the various councils had been carefully directed to the purpose.

Up to March 1906 the local authorities in Ireland under these Acts provided accommodation for 4,279 families, at a cost of about 180*l.* per family, or 789,874*l.* in all. The average rent was about 2*s.* 4*d.* per week, and the average annual loss about 3*l.* 5*s.* per annum. In the Dublin district, including the townships, most interesting examples of municipal effort in this direction could be seen; and the magnificent rehousing schemes of Lord Iveagh were worthy of special attention, as were also the varied and able designs of the city architect. In the Dublin district the Dublin Artisans' Dwelling Company had provided 3,500 excellent dwellings at a cost of about 600,000*l.*; and if to these were added the dwellings provided by the Iveagh and Guinness Trusts, the Suburban Artisans' Dwelling Company and the Association for the Housing of the Very Poor, a total of 4,665 dwellings, costing about 750,164*l.*, was reached. It was interesting to observe that these associations had provided more houses in the Dublin district than had been provided by the town authorities in the whole of Ireland. The great influence of a good caretaker on the condition of working-class dwellings and on the cost for maintenance was not sufficiently regarded, and he was convinced that a city might possess an abundant supply of cheap homes in fair condition and yet be in great part insanitary on account of the domestic habits of the people. An improvement in these habits was urgently required, and could only be secured by education in simple hygiene and a much more rigorous inspection of the sanitary condition of houses than was now provided for. As to the provision of new houses for the working-classes in towns, the operations of voluntary societies or companies should probably be looked to as the most hopeful factor, and it was most desirable that such operations should be aided as far as possible by the State.

#### SANITARY ADMINISTRATION OF DUBLIN.

THE inaugural address at the Sanitary Congress in Dublin was delivered by Sir Charles Cameron, the chief medical officer for the city. He said that the city of Dublin contained a population estimated in this year to be 300,691. Together with four townships, it constituted the Dublin metropolitan registration area of the Registrar-General, which contained a population of 390,691. In comparing the vital statistics of Dublin with cities like London, those of the city alone were often taken, not those of the whole registration area, which really included the suburbs of the city. Forty years ago the sanitary staff of the Corporation of Dublin consisted of the whole of one man (an inspector of nuisances) and a small part of another man (the secretary of the markets committee). Now the staff included a medical superintendent officer of health, who was also executive sanitary officer and public analyst; 20 *ex-officio* officers of health, who were the Poor Law medical officers; an assistant executive sanitary officer, a veterinary surgeon, two building surveyors, a superintendent of sanitary sub-officers (sanitary inspectors), 32 sanitary sub-officers, six lady sanitary sub-officers, two inspectors (one a lady) under the provisions of the Shop Hours and Shop Assistants' Seats Act, three inspectors of food under the Public Health Acts, two inspectors of food under the Sale of Food and Drugs and Margarine Acts, an inspector of slaughter-houses, caretaker of refuge for persons whose dwellings were being disinfected and persons who had been in contact with cases of infectious disease; 12 clerks, caretaker of smallpox hospital, six labourers, a superintendent of disinfecting department and a staff of twenty-three disinfectors, ambulance men, drivers, white-washers and charwomen. The total number of persons employed in the public health department, and including the superintendent and staff of the Corporation baths and washhouses, was 112. This large staff had for main objects the betterment of the sanitary condition of the city. Perhaps in no other city in the United Kingdom was the work of the sanitary department more extensive and difficult. A hundred years ago Dublin was the largest town in the United Kingdom outside London; now it was exceeded in population by six cities, which, during the hundred years, had grown from moderate size to enormous proportions. They were comparatively new as regarded their houses, but the Dublin of 1907 was much the same as regarded its residential houses as it was in 1807, except that the houses formerly occupied by single families were now largely tenement houses, and were so old that it was difficult to keep them in repair. In these houses thirty-seven out of every 100 families in Dublin occupied each a single room. In many English towns not 10 per cent. of the families

were occupiers each of a single room. The poverty of a large proportion of the people was shown by the fact that whilst about 16 or 18 per cent. of deaths in English towns occurred in workhouses, hospitals and other institutions, more than 40 per cent. of the deaths in the city of Dublin take place in these institutions. One-third of the inhabitants of Dublin were not natives. Many of the persons who had come to Dublin from the country had not added to its wealth or health. The Dublin hospitals were largely supplied with country patients. It was not fair to compare a city which, as in the case of Dublin, contained an abnormally large poor population, with cities like London, in which there were higher standards of wealth and comfort. In 1906 the expenditure of the public health committee amounted to 15,593*l.*, and the revenue, including the liberal contribution of 2,091*l.* from the Local Government Board, was 4,339*l.* 9*s.* 4*d.* A large proportion of the expenditure was in relation to the maintenance of fever patients, payment for notifications of infectious diseases, fees to the registrars of cemetery boards, working the Act relating to the street trading of children, contributions towards the maintenance of open spaces, proportion of law agents and accountants' expenses, expenses in connection with the Contagious Diseases (Animals) Acts, and in providing dwellings for the working classes. The Corporation had expended 485,000*l.* in clearing unhealthy areas, and a very large sum in the erection of baths, wash-houses, refuse-destructors, abattoirs, &c. The Corporation of Dublin had expended 345,000*l.* in providing dwellings for the working-classes, and a large sum in the erection of baths and washhouses, abattoirs and a disinfecting house refuge for persons whose residences were undergoing disinfection or who had been in contact with cases of infectious disease. A sum considerably over half a million had been expended in main drainage works, designed to free the river Liffey from pollution and to prevent the blocking of the street sewers. They maintained, as he had shown, a large sanitary staff. Had there been any substantial results to justify so great an expenditure? There had been good results; very good as regarded the lessening of zymotic diseases, but it was somewhat disappointing that the general death-rate had not been reduced to a greater extent. As he had already said, this might be owing to so large a proportion of the population coming under the heading of the very poor. Still, he thought the following statistics would show that the money spent upon improved sanitation had produced a good result:—

	General Death-Rate.		Zymotic Death-Rate.	
	Dublin City.	Dublin Registration Area.	Dublin City.	Dublin Registration Area.
Mean of ten years—				
Period 1879 to 1888 .	31.5	28.6	4.2	3.8
Mean of ten years—				
Period 1889 to 1898 .	28.9	26.0	2.9	2.5
Mean of five years—				
Period 1899 to 1903 .	28.1	25.7	2.9	2.5
Mean of three years—				
Period 1904 to 1906 .	23.7	22.3	2.0	1.8

In 1906 the zymotic death-rate in Dublin was below that of the sixty-seven largest English towns, and even below that of London.

Dublin was built partly on stiff boulder clay, partly on loose gravels. Having studied the incidence of typhoid fever in Dublin for many years, he ascertained that the disease prevailed to a greater extent in the districts on the gravels than it did on the clays. This seemed to him to indicate a connection between the soil and the disease. It appeared to him that the disease was of semi-malarial character, and that the micro-organism causing it might for a time exist in filthy soils. Some years ago Dublin was largely a midden city; but since he became chief medical officer of health incessant efforts had been made to adopt the water-carriage system of filth removal, and now Dublin had practically got rid of the objectionable midden system—a system which, existing still in some English towns, helped to raise their death-rates. Some years ago Dublin had the highest death-rate from typhoid fever amongst the towns in the United Kingdom, with the exception of St. Helens in Lancashire. Now typhoid fever is an insignificant factor amongst the causes of death. In 1906 fifteen persons out of every 100,000 died from enteric fever.

## GYPSUM AND ITS WORKING.

THE members of the North Staffordshire Institute of Mining and Mechanical Engineers had an interesting excursion last week to the gypsum mines and works of Messrs. J. C. Staton & Co. at Fauld and Tutbury, where they had excellent opportunities of learning the manner in which gypsum is mined, how it is manufactured and the uses to which it is put. The visitors were met by Mr. Trafford Wynne, the engineer of the mines. On arrival the dressing sheds were first inspected, says the *Staffordshire Advertiser*, and the visitors observed how the stone brought from the mine is sorted into its various qualities and despatched to the mills at Tutbury. The members then entered the mine by means of the tunnel running into the hill-side, and proceeded over the extensive workings for a considerable distance, observing the system of mining, the method of getting the gypsum rock destined for conversion into plaster and the method of obtaining the blocks of alabaster. At one point a block, 12 feet long and  $4\frac{1}{2}$  feet in width, had recently been got, and the men were seen cutting out a similar block. Afterwards they inspected Messrs. Staton's plaster mills, where they were able to see the various methods adopted for converting the gypsum rock into plaster and cement. The water turbines, which supply the whole of the power necessary for the working of these huge mills and which produce a minimum of 300 horse-power, proved a great source of interest, this economical means of obtaining motive-power being generally commented upon and probably envied by engineers who have to resort to expensive means of driving plant under their control. Next the visitors observed the various means—generally simple in character—of converting the gypsum into plaster. Ordinary plasters, such as those used for potters' mould-making and that used by builders, are made by first crushing the stone, next grinding it to the finest possible powder, and then driving off the water by the process known as boiling. The powdered gypsum is placed on large circular hearths under which are furnaces and flues, and constantly stirred by mechanical means. At the conclusion of this operation the plaster is packed and ready for sale. The finest plaster used for artistic work and various other plasters are first calcined in kilns, then scrupulously brushed to remove foreign matter, and then ground as finely as possible in mills. Keene's cement, parian cement and patent cements are first calcined, next treated chemically, then "baked" again and finally ground up. A variety of plaster known as "pink plaster," owing to the colour it gains from the iron in certain classes of gypsum, is made by the firm, and in order to meet the requirements of mould-makers and others who require a finely-ground plaster at a cheap price, the firm make a high grade of "pink plaster" by first grinding it as finely as possible and then boiling it in the manner described above.

According to Mr. Wynne, the use of alabaster by sculptors, especially for monumental work and church decoration, dates back to ancient times, and so far as he could learn the whole of the stone so used came from the mines lying between Tutbury Castle and the site of the present Fauld mines. "The Register of John of Gaunt," now in the office of the Duchy of Lancaster, records that a monument was erected by John of Gaunt, Duke of Lancaster, to the memory of his duchess in St. Paul's Cathedral in 1363, the chief material being alabaster sent from Tutbury, and the cost, including carriage, being 486*l*. At an earlier date than this alabaster was largely used in the archway of the great western doorway of Tutbury Church, commenced in 1080. This shows that its use in sculpture dates back to the Norman Conquest, and it was probably well known in France at an even earlier date. The use for monumental purposes is also shown by the fact that when Tutbury Church was restored, in the early part of the last century, several large alabaster slabs were found with inscriptions dating from 1622 to 1681. Recently Messrs. Staton's mine at Fauld produced eighteen huge blocks of alabaster, each weighing about 15 tons, which were sent to be used as columns (14 feet 6 inches long by 4 feet 6 inches in diameter) for the entrance-hall of the sumptuous and ornate mansion of Mr. J. K. Vanderbilt, the New York millionaire. It should, however, be stated that it is only in a few places that the gypsum is found sufficiently massive and whole as to be suitable for use as alabaster blocks, and hence it may be considered almost as a by-product of gypsum-mining, except in the Dove Valley. The bulk of the gypsum extracted from the mines is used for a more

commercial purpose, being sent to the plaster mills, where it is manufactured into Italian plaster, plaster of Paris, parian cement, Keene's cement, floor plaster and various patent plasters which are secret mixtures. The finer varieties are used for artistic purposes—for the casting of sculpture and modelled works of all descriptions, for the making of potters' moulds and for various industrial purposes. The best and commoner varieties of plaster, parian cement and Keene's cement are also used for the internal lining and ornamentation of buildings, and a large quantity is used in manufacturing blocks or slabs of plaster for use as fireproof partitions, &c.

The gypsum deposits in the Dove Valley, with which the excursionists were concerned, lie near the village of Hanbury and just to the south of the road which leads from Tutbury Castle to Sudbury. The three mines which are now working are situate close to this road. Two of the mines are situate at Fauld and one at Draycott-in-the-Clay. The mine operated by Messrs. J. C. Staton & Co. at Fauld has been worked by them or their predecessors for very considerably over 100 years. It was originally an open quarry, and there is still to be seen the old kiln where the gypsum was burnt, and the threshing-floor, where the burnt stone was beaten with flails into powder, in which condition it was sold as plaster. Messrs. J. C. Staton & Co. had another quarry adjoining the old one, but both are now abandoned owing to the cost of removing the overburden, and the deposit is worked as a mine by means of a tunnel running into the hillside. The stone is dressed and sorted at the tunnel entrance, then sent over a private railway to the North Staffordshire Railway at Scropton, and thence conveyed to the mill at Tutbury. This mill, originally the corn-mill for Tutbury Castle, is now worked by turbines, the motive-power being furnished by the waters of the Dove, conveyed in a flume cut so long ago as the reign of Henry VII. Another mine is worked at Fauld, and adjoins that of Messrs. Staton, and the third is near by, at Draycott-in-the-Clay. The gypsum found in this deposit is of the massive variety, crystals being very rarely met with. All classes of the stone are mined from large alabaster blocks, either pure white or veined or coloured. The best white gypsum, from which the highest grades of plaster are made, pass through the various grades down to stone so mixed with marl as to be valueless. Anhydrite, or, as it is locally called, "hard stone," is met with in varying quantities. Anhydrite differs from gypsum in that it is practically pure calcium sulphate, and lacks the water of the latter. Consequently it is useless for conversion into plaster, and it is a problem for the chemist to discover as to whether it can be hydrated by some simple means and so made of commercial value.

As to the methods of working the mineral, Mr. Wynne says the system adopted is a kind of pillar-and-stall. There is, however, not the regularity in the size of the stalls and pillars that is usual in coal mines, as this depends so much on the varying conditions in different parts of the mine, how the roof stands and the quality of the rock. The great aim being to leave as little good stone as possible in the mine, the pillars are, so far as possible, left where the stone is inferior. They are generally left large enough to be cut through again, when the working places are finished. The rock is soft and easily bored with auger drills, which is done by hand so quickly that there seems no encouragement to go in for mechanically operated drilling plant. Powder is used entirely for blasting. The method of obtaining blocks of alabaster is more complicated, as it is of the utmost importance that they shall not be in any way shaken by blasting. Where good solid rock occurs and it appears suitable for cutting into alabaster blocks, all blasting in the immediate neighbourhood is stopped. The roof is undercut just above the good stone, and it is then blown down with lightly-charged shots, until the rock is cleared for about  $4\frac{1}{2}$  feet to 5 feet back and about  $2\frac{1}{2}$  feet to 3 feet in height above the block, and this space is then available for the workmen. A gutter about 10 inches wide is then cut along the back of the block for such a length as may be considered advisable, and others at each end, so that the block, generally  $4\frac{1}{2}$  feet wide and from 4 feet to 20 feet in length, is entirely separated from the rest of the block, except at the bottom. The thickness of the block is then determined, and usually it will be half the thickness of the rock, so as to obtain two blocks of equal size. A line is marked along the block at the height required and auger holes are bored through the block. Steel feathers and wedges are then inserted in the auger-holes and the block of alabaster is forced from its bed. It is then turned over,

examined and any inferior stone dressed off. If too large or if one end should prove to be inferior or shaken the block is sawn into such lengths as may be desirable, and it is then ready to be loaded on to waggons and sent to the artist or manufacturer. It is unfortunate that every block does not turn out to be good alabaster, and a large percentage prove, after going to considerable expense, to be valueless.

#### RESTORATION IN SCOTLAND.

AT the opening of an art exhibition in Peebles on Saturday, Sir J. R. Fergusson said the exhibition contained many meritorious works, and probably there were some scenes from the neighbourhood of the ancient royal burgh of Peebles which, beautiful in its situation, had near it many a spot well worthy of the painter's brush. To mention one, where would they find a more romantic scene than Neidpath Castle, the grim old tower perched on a rocky eminence overlooking a winding of the silvery Tweed, shadowed by wooded heights, looking down to Peebles and the hill-environed valley below? That old Border peel had been well cared for. The father of the present venerable but evergreen Earl of Wemyss repaired and strengthened it with kindly care, except that part that was battered by the ruffian Cromwell. Pity it was that similar consideration had not been the lot of Holyrood chapel. The failure of the patriotic bequest of the late Earl of Leven and Melville was much to be deplored, and could only give satisfaction to those very superior æsthetic individuals who would rather see a noble and time-honoured edifice crumble away and fall to ruin than lift a hand to help it. He was glad to see that the chapter-house of the old church of Restalrig was to be restored by the liberality of the Earl of Moray, and that the work was to be in the able hands of Mr. Ross, the architect named by Lord Leven to carry out what he intended at Holyrood.

#### PLANNING OF SANATORIA.

THE "Rôle of Sanatoria as a Factor in Checking Tuberculosis" was treated by Professor M'Weeney at the meeting of the Royal Sanitary Institute in Dublin. He said that a sanatorium played the most important part in the campaign against tuberculosis, because it was the only curative institution; because, without a place whither curable cases could be sent, the work done against tuberculosis could be at best only advisory, and therefore ineffective; because it provided the best centre on which popular endeavour might be focussed, and from which hopeful and hygienic streams of influence could radiate on to the community at large; and because it might be provided out of local taxation under the existing law. He expressly disclaimed the position that the struggle against consumption had for its only weapon the sanatorium. On the contrary, he held that the following measures were also called for:—(a) Compulsory notification under a special Act of Parliament so as not to impose upon consumptives the penalties entailed by the existing notification law. (b) The provision of bacteriological aid in the diagnosis of early cases before the physical signs had developed. This meant that the physician who attended the poor should, in a doubtful case, be enabled to send the sputum to the municipal bacteriologist for gratuitous examination as to the presence of bacilli, his report when positive to be taken as a notification of the case at the Public Health Office. (c) Consequent on the thorough disinfection of rooms vacated by consumptives through removal or death, the movable articles to be dealt with, so far as possible, by superheated steam in the public disinfection apparatus, the immovable ones to be dealt with locally by formic aldehyde vapour and (or) limewash. The bactericidal efficacy of the measures adopted not to be taken for granted, but to be actually tested from time to time by animal experiment. (d) The establishment of special dispensaries in populous centres, with the object of giving counsel to those threatened, so as to enable them to avoid the disease; paying domiciliary visits to poor consumptives, applying the best modern methods to the diagnosis of the tubercular affection and sending those found already affected to the appropriate institution, viz. the early cases to the sanatorium and the advanced and highly infective ones to the special hospital. (e) The provision of the special hospital just referred to. It should be called the consumption hospital, to rob it of its hopeless character and prevent confusion with the sanatorium. It should be made comfortable, so as to induce infective

cases to stay there, but in case of resistance there should be powers to bring and keep them against their will. (f) The provision of spittoons wherever possible in places of public resort and the formal prohibition of spitting in public, under penalties which should not be allowed to become and remain a dead letter. (g) A thorough system of inspection of all milk-producing establishments within the administrative area, and the bacteriological control of milk coming in from without, with the object of detecting the sources whence milk containing the virus of tuberculosis is supplied to the public and putting a stop to the practice, with suitable compensation when due to want of knowledge, and with the severest penalties when wilful neglect is proved. (h) Appointment of expert medical men to visit primary schools and periodically examine the pupils, segregating declared cases, and marking off those threatened for attendance on a special "open air school." His view was that since the campaign against consumption must begin somewhere, the point at which to start was the provision of a working-class sanatorium in each populous centre. Conditions *sine quibus non* for the success of the sanatoria were (1) the reception of early cases only. When tubercle bacilli had appeared in the sputum the case had already passed out of its earliest stage and into that of lung destruction. Modern methods, such as X-rays, agglutination and diagnostic injections with Koch's old tuberculin, should be resorted to in order to assure the diagnosis before the sputum became bacilliferous. (2) The conduct of the institution by a genuine expert, i.e. a medical man who had previously devoted all his attention for several years to sanatorium work. (3) The situation should be suitable and the construction specialised. (4) The patients must not be allowed to return to their unhealthy avocations and surroundings, but must be provided with suitable, light, out-of-door employment after their "cure." He trusted that one result of the present discussion would be the still closer focussing of public attention on this matter, and consequent speedy action, with the result of saving the lives of hundreds of poor consumptives, and maintaining for several years the wage-earning power of many others.

Dr. H. Handford, of Nottingham, spoke of the work carried on in the Nottingham and Notts Sanatorium for Consumption. He expressed himself in favour of the development of the plan for taking into sanatoria a much larger number of persons for educative purposes. Injury had been done to sanatoria by making too great claims as to their curative powers. It was the best means known at present for controlling this disease. As to the permanence of the results he quoted returns of the work in the Notts Sanatorium, from which it appeared that in the last four years out of 359 patients 174 were well and at work, 98 were dead and the others were in different stages of recovery.

Professor Anthony Roche did not deny the benefit of sanatoria, but thought it had been exaggerated. The decrease in the death-rate from this disease in England took place before sanatoria were established, and was mainly due to improvement in the sanitary conditions, whilst in Ireland the neglect of these improvements had been followed by an increased death-rate. If the local sanitary authorities in Ireland were to bear the expense of the establishment and upkeep of sanatoria, he would rather see the money required for these purposes spent on improving the housing of the people and other general sanitary reforms.

Dr. Willoughby, of Eastbourne, stated that from 20 to 25 per cent. of the persons suffering from consumption in Brighton had been through an educative course. The educative value of sanatoria was, in his opinion, a long way ahead of the curative value. To the two main ideas of education and cure he should add prevention. They must have two sorts of institutions—one for the advanced cases, and the other for the second class of cases, but every man's home should be a sanatorium. Means must be found for avoiding the very expensive sanatoria, which did a great deal of harm in prejudicing public opinion against this form of cure, and providing less expensive institutions.

Mr. E. T. Hall, F.R.I.B.A., London, agreed that evil had been done by the large sums of money spent in costly sanatoria, and stated that he was engaged in devising some cheaper institution.

Mr. G. Plummer, of Mortlake, has been appointed surveyor and sanitary inspector by the Haywards Heath Urban District Council at a salary of 170*l.* a year.

## EDINBURGH ARCHITECTURAL LECTURES.

THE first of a series of four lectures to be delivered in connection with the architectural exhibition being held in the Royal Scottish Academy was given by Mr. Alexander N. Paterson, Glasgow, on "Scottish Domestic Architecture of the Seventeenth Century." The remarkable development of house building throughout Scotland during the sixteenth and seventeenth centuries produced, he said, a special type of house. With variations the same type was found, notwithstanding an entire lack of facilities for travel, throughout all Scotland from Kirkwall to Carlaverton and from St. Andrews to Dunvegan. This simultaneous development was due to a common origin, common needs, common limitations and common sentiments. The common origin was the square peel tower or Norman keep; its common needs were in the first instance shelter and defence; the limitations were the lack of possibility of introducing foreign materials or transporting heavy loads; the common sentiments were a certain conservatism or patriotism which clung to characteristics after they had lost their meaning—a love of Scotsmen for things Scottish. On the square peel tower were grafted special characteristics for defence, the corbelled-out bartizan and the salient wing, instead of the square plan, the L-shaped plan, with a door in the re-entering angle. The roof was always formed with gables. Where in France the roof was a steep hipped roof, in England there was a flat platform roof, while in Scotland there was always a steep sloping roof and crow-stepped gables. From these features were developed the national characteristics which pervaded all this type of work—corbelling the gable, the crow steps, the dormer windows. Mr. Paterson traced the submergence and the partial revival under Sir Walter Scott of this architecture and its further development in our own time. Mr. Hippolyte J. Blanc, R.S.A., who presided, moved a vote of thanks to Mr. Paterson. The next lecture is by Professor Charles Gourlay, Glasgow, on "Thessalonica."

## JUBILEE OF THE EDINBURGH ASSOCIATION.

THE Edinburgh Architectural Association, whose jubilee is being celebrated just now, says Mr. G. S. Aitken in the *Scotsman*, began with the small number of nine members, of whom four survive, one being in Australia reaping the golden harvest of agriculture, another is in Lancashire engaged in rural occupations, the third is Mr. Morham, who has so long honourably occupied the position of city architect in Edinburgh, and who was the second president of the Association; the fourth is the writer, who was the first president.

The preliminary meeting was held in a private house and the succeeding ones in more neutral premises; we were enthusiastic young men, and probably our meetings had more of the literary than of the practical element about them.

An early paper was on Druidical and Celtic remains, another on symbolism in architecture. Our custom was to have two formal criticisms on each paper, and I find from the notes of the critique which fell to my lot that the author of the latter paper held the usual theory about the threefold doctrine implied in the triple arrangements of plan and section in church architecture, believing further that a rose window signified Providence and an eight-sided font Regeneration. In our discussions on the comparative merits of Gothic and Classic architecture we were greatly influenced by Ruskin's writings, who, as it happened, was lecturing in Edinburgh on architecture at that time. One of his illustrations showed the iniquity of Classic architecture, and was taken from the conventional lion's head on the eaves of the Royal Institution, contrasted with a sketch by Millais of a real lion's head.

The rules of the Association provided that its committee should annually make a selection of the papers read before it during the previous year, which were to be bound and deposited with the Society and published if it saw fit. It was not till the year 1889 that this resolution was carried out, and we have since that date a most valuable set of Transactions.

Competitions in design and construction were to take place among the professional members and a selection appended to the Transactions. This idea was also taken up in another form at a later date.

Meanwhile, from 1856 to 1859 the Architectural Institute of Scotland, then nearing the sunset of its career, had

established a system of prizes for architectural designs and perspective.

A year earlier (1855) the School of Design at the Royal Institution began its course of prizes for similar work, adding the measuring of old buildings to the list. A very interesting class of practical geometry was begun by Mr. E. W. Dallas, the second master, who published a textbook on that science.

Mr. Alexander Christie, A.R.S.A., the chief director of the school, conducted the class for measuring old buildings, taking St. Anthony's Chapel as the first subject; drawings of what we supposed to have been its original condition were prepared in competition, and the first prize gained by Robert Anderson, now Sir Rowand, and the second by a clever Heriot, Walter Turbett, who died many years ago. Duddingston Church was another building studied, in which we were supervised by Mr. Andrew Kerr, to whom was afterwards entrusted the restoration of Roslin Chapel. The crown of our labours was Holyrood Abbey Chapel in 1856-7, the first prizeman for it being Robert Morham, the second Thomas Arnold, now retired after a successful career in London. The next year the first prize fell to the present writer for some work at Jedburgh Abbey, and the second to Francis Stanley.

Some names of Royal Institution students are interesting, either from their relationship with eminent people or for their own after career, and immediate success as prize-takers. William Miller, the son of the Quaker engraver, was one; Walter Smith, who I believe became the principal of an American art school, was another; Robert Anderson, now Sir Rowand, as already mentioned; David Robertson, A.R.S.A.; Francis Stanley, son of Montague Stanley, R.S.A.; Edward Traquair, brother of the lately resigned Director of the Natural History Collection in the Royal Museum of Science and Art; and Robert Morham, the present city architect.

Among the Architectural Institute's successful students may be noticed the name of William Leiper—now R.S.A.—who has risen to eminence as an artist-architect, and Thomas Ross, the joint author with the late Dr. Macgibbon of a goodly number of volumes on the castellated and domestic architecture and the ecclesiastical edifices of Scotland.

Contemporary with all these, and students in the same place, were young men who have since become famous as artists, such as William M'Taggart, Peter Graham, Hugh Cameron, Thomas Graham, John Pettie, John Smart, John and Alexander Barr, all of whom, as well as Alexander Brodie and John Hutcheson, sculptors, were pupils and prize-takers in the year 1855-6. John Macwhirter's name does not appear, but he was probably at work before this in the Institution classes, and was, at any rate, at that time regarded as a rising landscape-painter. His position to-day justifies the high esteem in which he was then held by Lord Cockburn, who took much interest in his Colinton Dell and other studies near his native village of Slateford.

It is interesting to note the evolution of one of our Edinburgh architects and his architecture. Robert Burn builds Gillespie's Hospital and the Nelson Monument on the Calton Hill; in due time his son William Burn succeeds to his practice, and after a successful career in Scotland, part of the time in collaboration with David Bryce, crosses the Border and becomes the architect of a phenomenal number of large mansions distinguished for the excellence of their planning.

Several English architects have been engaged in adding to the beauty of Edinburgh during the jubilee period. Sir Gilbert Scott in St. Mary's Cathedral; Alfred Waterhouse in his Prudential Buildings; William Slater in St. Peter's, Luton Place; Captain Fowkes in the Museum of Science and Art. C. R. Cockerell, associated with Playfair, in the National Monument on the Calton Hill, belongs of course to an earlier time.

Edinburgh, like other ancient cities, obliged to sacrifice many of its old buildings and much of its city wall, has on the whole been conservative of what was worth preserving. The choir and transepts of the demolished Trinity College Church, whose stones long lay on the slopes below the Calton Hill, easily accessible to us architectural students for sketching from, have been re-erected not far from the original site; and William Adam's Old Infirmary front was removed to Dreghorn by the late Mr. Macfie, and put up in fragments on the outskirts of his estate within view of the high road. St. Margaret's Well has been transferred from its original site under the railway works at Restalrig to a more appropriate locality in the King's Park, opposite Holyrood Palace.

## GENERAL.

**The King** has honoured Mr. P. A. Laszlo, the Hungarian artist, with sittings at Windsor Castle for his portrait in ordinary dress, not in uniform. This is the first time that His Majesty has been painted in ordinary dress.

**Mr. W. E. Cattanach**, architect, Kingussie, has been appointed one of the chief assistants in the Architectural Department of the Egyptian Soudan. Mr. Cattanach has had a successful career in his profession both in the north of Scotland and in London prior to securing his Government appointment.

**Among the Birthday Honours** gazetted last week were knighthoods for Professor H. von Herkomer, C.V.O., R.A., and Mr. William Q. Orchardson, R.A.

**The Gloucestershire** standing joint committee on Tuesday unanimously resolved that instructions should be given for the provision of plans for a new petty sessional court at Gloucester on land adjoining the police station, and that as soon as possible offices for the Education Department and the county accountant should be provided at the shire hall.

**The Liverpool Museum** committee have received this week on loan from the Southport Corporation an ancient dug-out canoe, formed of a single tree trunk, 16½ feet long by 4 feet broad. It was found nearly eight years ago on the southern extremity of the old Martin Mere, one of the largest lakes in Lancashire.

**Probate of the Will** of the late Mr. Julius Alfred Chatwin, architect, Birmingham, who died on June 6, dated October 25, 1870, and four codicils of later date, has been granted to his widow and his sons, Mr. L. Boughton Chatwin and Mr. P. B. Chatwin, the executrix, executors and trustees mentioned in the first codicil. The value of the estate has been sworn at 40,717*l.* gross and 40,443*l.* net.

**The Partnership** between Mr. Walter W. Thomas and Mr. G. de Courcy Fraser, architects and surveyors, Liverpool, under the name of Walter W. Thomas & Co., has been dissolved. The practice will be continued at 15 Lord Street by Mr. W. W. Thomas.

**Alderman Kendrick**, on Tuesday, offered 5,000*l.* towards the Picture Gallery Fund for Birmingham. At the same meeting of the City Council Mr. J. T. Middlemore, M.P., offered to present the painting by G. F. Watts, R.A., known as *Little Red Riding Hood*.

**The Chancellor of the Exchequer** stated in the House of Commons on Monday, in answer to Mr. Austen Chamberlain, that it was proposed to make the advance of the loan of 800,000*l.* for rebuilding purposes to the Government of Jamaica from the Local Loans Fund by instalments, as the money was required. The necessary powers would be asked for this session.

**The Auctioneers' Institute** of the United Kingdom celebrate their coming of age in London on July 23, 24, 25 and 26. An interesting series of excursions have been arranged for the three available days.

**The London Joint-Stock Bank** have arranged to erect premises at the junction of Kingsway with Portugal Street. The elevations will be in Portland stone and in brick with stone dressings.

**The Shaftesbury Memorial Fountain** in Piccadilly Circus, designed by Mr. Gilbert, R.A., is now being cleansed and repaired. The bronze and aluminium parts had suffered considerably from the effects of exposure to the atmosphere.

**Mr. Robert Fogarty**, architect, died last week in Limerick. After long experience in India he returned to succeed his father, the late Joseph Fogarty, and he was appointed diocesan architect for the province of Munster. Another office held by him was in connection with the preservation of the ancient monuments of Ireland.

**The Committee** of the Leeds School of Art invite applications, before July 15, for the post of master of the architectural department. The salary is 200*l.*, and the work will commence in September next.

**The Result** of the Assistants' Prize Competition offered by the Institution of Heating and Ventilating Engineers for the past year is as follows:—J. Roger Preston, 5 China Street, Lancaster, for his paper on "Air Recording Meter," first prize, 10*l.* 10*s.*; W. H. Casmey, Standard Buildings, City Square, Leeds, for his paper on "The National Importance of Heating and Ventilating," second prize, 8*l.* 8*s.*; Thomas Taylor, 10 Acacia Grove, West Dulwich, London, S.E., for his paper on "Low-pressure Hot-water Heating Plants for Private Houses," third prize, 2*l.* 2*s.*

**Mr. P. Fletcher, R.B.A.**, died on Saturday in his sixty-fifth year. He was the son of an architect, and many of his pictures deal with architectural subjects, such as continental cathedrals and other buildings.

**At the Last Meeting** of the Glasgow Corporation the Lord Provost intimated that a public-spirited citizen, who wished for the present to remain anonymous, had expressed a desire to present a drinking fountain of granite by a leading architect to be erected in Castle Street, Townhead, at a point nearly opposite the reconstructed Royal Infirmary. He moved that the gift be accepted, the donor thanked and a remit made to the statute labour committee to arrange details.

**The Bridge House Estates Committee** have asked Mr. Basil Mott to prepare a scheme for the rebuilding of Southwark Bridge and its approaches. The estimated cost of the work is between 500,000*l.* and 570,000*l.*, which will be provided out of the funds of the Bridge House Estates, which amount to 150,000*l.* a year.

**The Replica** of the late Mr. G. F. Watts's statue, *Physical Energy*, is practically completed, and as soon as the pedestal has been constructed it will be erected in Hyde Park. The site has not yet been chosen, but the position most favourably regarded is in the Broad Walk. A plaster model has been erected in the grounds of Mrs. G. F. Watts at Guildford.

**The Society of Arts** held their annual general meeting on June 26. Sir S. C. Bayley, the chairman of the Council, in moving its adoption, said that another matter with which the Council were dealing, although it was not in the report, was the question of additional accommodation, which was very badly needed for the development of the Society. They had hoped at the beginning of the year that it would have been possible to secure further space on their present site, but up to the present the negotiations had not borne fruit, and they were now, at the end of the year, no better off than they were at the beginning.

**The Free Library Committee** of the Wednesbury Town Council reported on Monday having accepted the design of Messrs. Crouch, Butler & Savage, of Birmingham, for the new Carnegie Library.

**Mr. W. H. Brierley** has been appointed to carry out the restoration of St. Michael-le-Belfry, York. He estimates the cost at 1,200*l.* The roof of the church requires immediate attention, it being two or three hundred years old, and having cracked, causing it to leak. The windows and stonework are also in a very bad state, and the glass is tumbling out of place, the wet consequently getting in. But the most serious matter is that the decay is going on very rapidly. The mullions of the tracery windows may fall down any day, and in that case, should the very valuable glass be destroyed, it cannot possibly be replaced. The panelling underneath all the windows and the moulding are nearly all gone, and the main walls, timber and lead require immediate attention.

**An Exhibition** of antiquities found by Professor Naville in the Temple of Deir-el-Bahari will be on view at King's College, Strand, from July 9 to 30.

**Instruction in Clay Modelling** is to be continued in such of the London elementary schools as are provided with a special art-room or other suitable facilities for modelling in clay. The use of plasticine in schools without art-rooms is under consideration.

**M. Carolus Duran** was authorised to exhibit his portrait of Chulalongkorn, the king of Siam, during the last week in the Salon of the Société Nationale des Beaux-Arts. It is destined for the throne-room of the palace in Bangkok.

**At the Mansion House**, London, on June 28, the Lord Mayor presided over a meeting called for the purpose of promoting the interests of the National Institution of Apprenticeship. Lord Avebury moved, and it was agreed, "That it is of the utmost importance that the children of the working classes should be properly taught and trained in trades requiring skill in order to prevent their drifting into the ranks of the needy unemployed, who are practically all unskilled labourers." It was also resolved, "That apprenticeship is the best method of teaching trades requiring skill, and the organisation of the National Institution of Apprenticeship and the assistance it provides, by making the loans and grants for premiums payable to the masters, and by supervising the apprentice, affords the most practical means of effecting apprenticeship, and makes them mutually satisfactory."

**Mr. Arthur H. Ryan-Tenison, F.R.I.B.A.**, announces that he has removed from 12 Little College Street to 21 Great Peter Street (National Society's House), Westminster, S.W.

# The Architect.

## THE WEEK.

THE name of the late WILLIAM LE BARON JENNEY is likely to be remembered for several years to come, inasmuch as the American Institute of Architects concluded in favour of his claim to be considered as the originator of skeleton steel construction and of the lofty buildings which followed. He was born in 1832, and in 1854 he became a student in the Central School of Arts and Manufactures in Paris. On the outbreak of the Civil War he served on the staffs of General GRANT and General SHERMAN as an engineer officer. When the war was over he settled in Chicago. A few years afterwards a fire in the city afforded him many opportunities for showing his skill in planning. In 1883 he introduced the system of skeleton construction in the Home Insurance Building, and there was some hesitation about adopting the arrangement. The columns were of cast-iron, and steel beams made by the Bessemer process were employed. Several years afterwards the Bessemer Steamship Company named a ship after him in recognition of his services in connection with the invention and introduction of lofty steel skeleton construction. He entered into partnership with Mr. W. B. MUNDIE, and the firm carried out several important mercantile buildings. Ill-health compelled Mr. JENNEY to retire from practice in 1905. He settled at Los Angeles, where he died on June 15. He was a typical American, and his countrymen recognised his value.

ACCORDING to Mr. FREITAG, it was in order to obtain a maximum of light for the offices proposed in his Home Building that Mr. JENNEY decided to reduce the width of all exterior piers as much as possible, and to use cast-iron columns within the piers to carry the floor-loads, thus relieving the masonry piers of these loads, and consequently reducing their areas. The question then arose as to the supposed expansion and contraction of continuous metal columns 150 feet high, subjected to a variation of some 120 deg. Fahr., and this suggested carrying the walls as well as the floors storey by storey on the columns, thus dividing the movement. The exterior piers were made self-supporting, but the spandrel portions, between the top of one window and the bottom of the window above, were carried on girders placed in the exterior walls and extending from column to column. The foundation piers in the Home Building were made of masonry, pyramidal in form, and consisting of alternate courses of rubble and dimension stone. This method of supporting the walls as well as the floors and floor-loads on beams and columns was a most important departure from former methods, and attendant responsibilities of design were at once encountered. The concentration of superstructure weights resulting from such design was soon given consideration, and the employment of iron rails in foundations, as in the Montauk Block, was extended to more important use in the calculation of isolated footings.

THE University College of North Wales is an example of the great interest which is taken in education in that part of Great Britain. The college is a portion of the University of Wales. In 1883 the Government, acting on a report of a special committee, offered aid for the establishment of a college in North Wales. So many towns were eager to possess the college it was difficult to select one, but finally the choice fell on Bangor. In October 1884 the college was opened in a building which had been used for a hotel. In the first year there were fifty-eight students, while in 1904-5, the last year of which there are returns, the number was 328. Originally the departments consisted of classics,

mathematics, philosophy, English literature and history, modern languages, physics, chemistry and biology. In succeeding years came departments for agriculture, electrical engineering, day training and secondary training. The Corporation of Bangor in 1902 offered a site of about ten acres to the college, and the college authorities then purchased an adjoining field containing  $3\frac{3}{4}$  acres. Having so large a site it was decided to undertake suitable buildings. There was a competition, and the plans by Mr. H. T. HARE were selected. It is proposed to start with the arts and administrative sections, and an effort will be made to undertake the large hall. The other departments will follow as funds are obtained, but for some time to come it will be necessary to use the old building. His MAJESTY in laying the foundation-stone on Tuesday said that time and money, energy and perseverance would not be spared in the effort to afford facilities for the acquirement of knowledge in the college. Mr. HARE was presented to the KING and QUEEN by Lord KENYON, the president, and handed to the KING the silver trowel with which the first stone was well and truly laid.

It is only in Paris that a man, because he was unemployed, would take revenge upon his family, his country and social policy by endeavouring to destroy a painting in the Louvre. On last Sunday such a scene was witnessed in the Salle Mollien, when Poussin's *The Deluge* was lacerated in no less than eight places. The painting has a peculiar interest. It is believed to have been one of the last works of the painter. He had executed several Biblical scenes, and it is supposed that he wished to express his hope that after his death he would find himself in a world where there was no envy. The rainbow he introduced was probably a symbol of the ground of his confidence. It has been said that it is a thought rather than a painting, and is expressive of the state of his feelings in his old days. On that account the painting has more interest for those who look on Poussin as one of the Great Masters than some of his works which are more attractive to ordinary spectators. If his *Shepherds of Arcadia* suggests the state of his mind at an earlier time, *The Deluge* is no less suggestive of his declining years. It is doubtful whether the picture can be restored, and on that account the vandalism is less excusable.

THE Corporation of Glasgow have been fortunate in obtaining the large painting by MILLAIS called *The Ornithologist* for the comparatively small sum of 1,000l. The subject was suggested by a visit of the painter to JOHN GOULD, the ornithologist, at his house in Charlotte Street, W.C. At the time the collector was an invalid, and his delight was in handling his specimens, especially humming-birds and birds of Paradise. On his way home MILLAIS said to his son, who accompanied him, that what he had seen would make a fine subject, which he should paint whenever he had time. The picture was commenced in the spring of 1885, and although it contained seven figures besides those of birds it was completed in time for the exhibition of the Academy. T. O. BARLOW, the engraver, served as a model for the ornithologist, the two small boys were the artist's grandsons, the woman who leans over them and the girl seated at the foot of the bed were professional models. The gentleman who gave the commission afterwards declined to take it on the ground that it reminded him of an illness in his own family. The painting was therefore kept by MILLAIS. He hoped that eventually it would find its way to a public gallery, and this hope has been realised. There is no doubt about the excellence of the execution. But the strength of the ruling passion by which the ornithologist appears to prefer a small bird to all his family-drawings, the public admiration like less important parts of the artist. Another portrait of BARLOW was painted in 1886 and now belongs to the Corporation of Glasgow.

## THE BRITISH MUSEUM.\*

IN laying the foundation-stone of the extension of the British Museum on the 27th ult., His MAJESTY said:—"Since its foundation a century and a half ago the literary, artistic and historical treasures stored in the Museum have increased enormously, thanks in great part to generous gifts and bequests." In these few words the peculiar character of the Museum is expressed. Like many other British institutions, the founders could not have anticipated what it was to become. The original nucleus has extended in a way that in the seventeenth century would be considered impossible, and what is true of one department may be said to apply to all the others. With the possible exception of some of PANIZZI's additions, the buildings were never in advance of the collections. If, for example, some wealthy individual were to present the Museum with an example of radium, the history of the collections would justify us in saying that in less than a century a special department would be required for the varieties of the mysterious substance.

The Museum is supposed to have originated with the offer of Sir HANS SLOANE to sell a collection consisting mainly of objects of natural history, which had cost him 50,000*l.*, but for which only 20,000*l.* was asked. The beginning may be traced further back to the purchase of Sir JOHN COTTON's collection of manuscripts in the reign of WILLIAM and MARY. An Act was passed for settling and preserving the Cottonian library. In 1706 Sir CHRISTOPHER WREN with TRAVERS, the surveyor-general, prepared a report upon the possibility of converting the building at Westminster in which COTTON lived into a public library. With the Sloane and the Cottonian collections as possessions, it was necessary to obtain a place to preserve them. It suggests the spirit of the time when we find there was nobody to advocate the erection of a special building. WILLIAM KENT had prepared a plan for new Houses of Parliament, and some one suggested that one of the proposed buildings could be utilised as a museum. But in reality the choice lay between Buckingham House and Montague House. For the former the price asked was 30,000*l.*, while the other could be obtained for a third of the money. It is needless to say Montague House was preferred, and was formally acquired in 1754. The building had been erected at the close of the seventeenth century, and took the place of the original Montague House, which was designed by ROBERT HOOKE, the mathematician, and the rival of WREN. The second building was supposed to resemble the first, and was carried out under the direction of PIERRE PUGET and other French artists. Some alterations were necessary, which cost as much as the house itself, and the removal of the collections must also have taken time. But the new Museum was open to the public in 1759. There were three departments only, viz. printed books, manuscripts and objects of natural history.

During a great many years the use of the collections by students was extremely limited. The principle which is found in so many Government departments of "how-not-to-do-it" dominated the new institution. ISAAC DISRAELI, the father of Lord BEACONSFIELD, was an early student, and from his writings we can learn many things concerning the practices in the British Museum. Artificial light was prohibited. CHARLES V. of France had ordered portable lights in order that students could continue their researches in his library. "Many among us," says DISRAELI, "at this moment, whose professional avocations admit not of morning studies, find that the resources of a public library are not accessible to them from the omission of the regulation of the zealous CHARLES V. of France." A light was not permitted to be carried about. That might be excusable. But even in the early part of the nineteenth century genuine students continued to be prevented from making such use of the books as they desired.

\* See Illustration.

The applications of PORSON for admission were, we believe, rejected, and DE QUINCEY from his own experience says there was an absolute interdict upon the use of the national property, and that practically the whole of the funds were employed for the creation of sinecures. Happily those days have vanished and the Museum is accessible to all. Although they might not be much used, books arrived in abundance, and the collection was worthy of a great country.

Originally it was not anticipated that sculpture was to be represented. Any coins or medals which were presented were treated as if they were manuscripts. In 1772 the fine collection of vases belonging to Sir WILLIAM HAMILTON was purchased. Although they could not be considered as belonging to any of the three divisions of the Museum, room was found for them. In 1802 an event occurred which not only gave a new character to the Museum, but enlarged the horizon of antiquity as it appeared to ordinary people. The English public were without any aids which would enable them to understand either the art of antiquity or of any foreign nation. There was no gallery where painting or sculpture was to be seen. Among the dreams of NAPOLEON was the establishment of a national collection in France in which the art of all time could be studied by the humblest classes. Accordingly he had seized on the finest works which could be found in Italy. When immediately afterwards he began the contest with England in Egypt, he brought a staff of connoisseurs and experts with him in order to take possession of whatever was at once precious and portable. The collections were massed at Alexandria. When the city succumbed to English troops the whole of the treasures which were designed for Paris became British spoil. Then it began to be realised how inadequate was Montague House. Soon afterwards the Townley Marbles were obtained. It became necessary to erect a special gallery for Egyptian and Greek examples, which was opened to the public in 1807. Then followed the purchase of the great Elgin collection, which is generally considered to be the most valuable acquisition of the Trustees.

GEORGE IV. in 1823 presented the splendid library which his father had collected, under the condition that the books were to be kept separate from those in the general collection. It partly consisted of books derived from the libraries in the colleges of the Jesuits at their suppression, and at the time it was handed over to the nation it formed the finest private library in the world. The condition of preserving it intact compelled arrangements to be made for the removal of any part of Montague House which had survived. It was then proposed to provide for the future, and for a time at least a public picture gallery was contemplated. One advantage followed from the idea, for several collectors of paintings offered to bestow them if a separate building were provided. The National Gallery is therefore to some extent an offshoot of the British Museum.

The commission for the new building was given to Sir ROBERT SMIRKE. As FERGUSON said, no architect ever had a fairer chance; the ground was free of all encumbrances, the design long and carefully elaborated before execution, and the money, which was more than a million sterling, was supplied without stint. Probably one-half the outlay was useless, for "the courtyard to which the whole building was sacrificed is already gone and the portico is voted a public nuisance, though it will not be so easily got rid of as the other." When the plan was under consideration, ANTONIO PANIZZI was not an official, although he was not far distant, for he occupied the position of Professor of Italian Literature in University College. In 1831 he was appointed as a special assistant. He proposed many changes, some of which were adopted. But it was not until 1837 he became Keeper of Printed Books. If ever there was the right man in the right place it was on that occasion. It is doubtful whether one of the keepers

was satisfied with the space assigned to his department by SMIRKE. But PANIZZI was a commanding genius who loved the delight of battle. He proposed to cover the quadrangle with a domed roof which would not interfere with the lighting of the principal building, and by that addition 300 readers at least could be accommodated. It was a daring project and if it failed PANIZZI's very numerous enemies would have rejoiced. But its success was unquestioned, and the name of the great librarian should be remembered with gratitude by all who use the collections. Complaints are inevitable concerning the Museum, but those concerning the reading-room and its arrangements have the least substance.

The Trustees have not been indifferent to the unavoidable necessity for increasing the area of the Museum. PANIZZI wisely got rid of the "objects of natural history," for, with all his versatility, he possessed no knowledge about them. But the space vacated was found to be insufficient to meet the new demands. The newspapers were exiled to a northern suburb, where few will care to seek them. Yet the keepers continued clamouring for additional space. In 1895 leases expired of houses near the Museum, and fortunately the Trustees were able to acquire an additional area of  $5\frac{1}{2}$  acres, thus bringing the total area possessed by them up to 13 acres. The extension of which the foundation was laid a fortnight ago will occupy the site of the houses which formed the south side of Montague Place. The preparation of plans was entrusted to Mr. JOHN JAMES BURNET, of Glasgow. According to the official account the building, which will be known as King Edward VII. Galleries, is to be composed of a basement and sub-ground floors, already constructed, which will provide ample storage space, chiefly for the never-ceasing additions to the library; next of a range of galleries, also to be appropriated to the use of the library. Above this, of a mezzanine floor, to provide official studies and students' rooms, and on the upper floor of a fine range of galleries, 380 feet in length, which will be adapted for the exhibition of the Egyptian or other collections. The façade, to be in keeping with the Classical style of architecture of the present buildings, is Ionic in character. A simple row of engaged columns, flanked by massive pylons, will occupy its full length, and will ultimately form the central feature of a structure which, in its severe simplicity, will fittingly express the repose and endurance which should characterise a great national museum.

The Trustees, knowing the history of the Museum, are aware that in the past the most important arrangements were dictated by absolute necessity. Accordingly they hesitate to dictate to posterity. But they suggest that the scheme which Mr. BURNET has sketched out may be left as a legacy to their successors, who will show their wisdom by carrying it to a successful completion.

#### COMPLIANCE WITH SPECIFICATIONS.

IN looking through specifications which were drawn up fifty or sixty years ago it is impossible not to be struck by the confidence which was displayed that all the materials used would necessarily be the "best" of their respective kinds, and the absence of any reference to tests in order to discover whether the "best" had been employed and how that quality was to be ascertained. Take, for example, such a structure as the Houses of Parliament. THOMAS GRISSELL and SAMUEL MORTON PETO guaranteed that the buildings and works were to be completed in the best and most workmanlike manner and in the most solid, durable and substantial mode, to the entire satisfaction of CHARLES BARRY or other architect. The bricks were to be equal to a sample approved by the architect and deposited with the clerk of works. In the brickwork was to be employed the best Dorking or Merstham, or other approved stone

lime. The timbers for floors were to be of the best Baltic wood; the oak was to be of the best description. The stone was to be of the very best and most durable quality. The roofs were to be covered with the best Westmorland or Cumberland slates. But from beginning to end there is not a word about how it was to be ascertained that the so-called best, which really signified the dearest in price, had been selected and used. Even the iron roofing was to be taken on trust, the only suggestion of the architect being that the work should be executed in London, partly on account of the acknowledged superiority of London over country castings.

It must be allowed that in the majority of buildings the confidence in contractors was not misplaced. A sense of honour was recognised in trade, and a man was sure to suffer in his business if he substituted inferior materials. It should, however, be remembered that in those simple days architects and builders relied mainly on nature for the direct supply of materials. Stone was brought from the quarry to the building site. Builders in many cases employed their own sawyers to cut trees into the scantlings required. Bricks were often made on a builder's field. Iron was not then much used in construction. Architects, as in the case of the Houses of Parliament, preferred that their builder should become responsible for it, whether adopted for columns or roofs. Sometimes it was specified that castings should be submitted to a "full proof," an expression which, however indefinite, was considered to be very exacting.

When nature ceased to be fully relied on and her materials were no longer set up in the state she offered, then it became necessary to adopt specifications of a different kind. Iron, like all materials, was not only liable to succumb if overloaded, but in large structures expansion and contraction were inevitable and could not be prevented. Various other materials which were obtained by the co-operation of mechanical power and chemistry with a natural product were also found to have their limitations, and it became essential that these should not be exceeded. It is only necessary to compare the experiments of TREDGOLD and BARLOW with the more elaborate investigations of FAIRBAIRN and HODGKINSON, to say nothing about their successors, in order to realise that a different system of judging materials was an absolute necessity. In England we have still a large amount of confidence in contractors, and it is seen in the manner of dealing with materials. But in Germany and the United States it may be expected that in a short time everything employed in architectural and engineering construction will have to be subjected to scientific tests which will become more severe as time goes on.

The proceedings at the annual meeting of the American Society for Testing Materials, which was held from June 20 to 22, is enough to suggest what is being done in America. The Society contains nearly a thousand members, all of whom are entitled to be considered experts, and no less than 268 of them were present. A few of the papers will indicate the extent of the field. Manilla wrapping paper may not at first seem to be of much importance in engineering. But it is used by one of the companies in connection with electric power. A paper on coal showed that in Government departments the contractor is required to state the number of thermal units and the percentage of ash in the coal which he offers to supply. The difficulty of the taking of tests is suggested by the fact that the thermal value of coal taken at the pit is often 25 per cent. lower than when delivered. A standard specification for coke is in progress. The effect of moisture on the strength and stiffness of wood was another subject. Much importance was attached to the testing of wooden and reinforced concrete telegraph poles, and it was found that the latter can fail if a rope is attached to the top of an appliance which will allow of an horizontal pull. According to some experimenters, a new electro-chemical

theory of the corrosion of iron is about to be revealed. The American Government have ordered an investigation of the causes of the deterioration of wire fences, and the official report on the subject will shortly be issued. Tests of cement occupied many hours in discussion. Among other results it was shown that the specific gravity test is not of much account for detecting adulteration.

To many who were present greater importance was attached to the address of the president, Dr. CHARLES B. DUDLEY, on "The Enforcement of Specifications," than to any of the papers. He is recognised as one of the highest practical authorities in America, for testing is the business of his life, and his experience therefore merits consideration. We referred above to the confidence which English architects reposed in builders. They in their turn depended on their sub-contractors. A modern American expert would on reading the lines express amazement that any structure erected under such conditions was able to stand for any longer time than the builder was responsible. Dr. DUDLEY asked whether it was safe to employ materials without the trouble and expense of maintaining a corps of inspectors. He said that those who for the occasion might be called consumers—i.e. architects and engineers—would reply that it is absurd to expect to get what you have contracted for unless people are watched. After his own daily experience with specification material during thirty years he was compelled to agree with them, and to maintain the necessity for inspection and tests. Dr. DUDLEY declined to consider the ethics of the subject. His theory is that a transaction is satisfactory when the user and the producer derive a benefit from a business, or in other words, when both parties are satisfied. But so many unexpected accidents may occur that a man who is disposed to act honestly discovers that he has failed to give satisfaction to his customer, and his failure may be supposed to arise from dishonesty.

Bearing in mind that satisfaction to producer and consumer is the desirable end of business, he gave an instance to show that the omission of a monosyllable may alter the whole character of an important transaction. Americans sometimes pride themselves on the absence of formalities in business affairs. One of that class, who was a lumberman or timber merchant, agreed to purchase a large number of logs from the owner of a timber tract, the simple specification being that only two logs from the same tree should be delivered. The logs duly arrived, and the lumberman was surprised to find them small, tapering and full of knots. What he imagined he should receive were two logs from the butt of the tree; but he had not used the word "butt," and the owner was therefore justified in interpreting the order as two logs from the top of the tree. The price given was low, and it is not impossible that cuteness had overreached itself, for no litigation followed. On the other hand, specifications may be so elaborate as to fail in their purpose. Specifications for steel, it is said, often prescribe impossibilities. The manufacturer accepts the risk and does his best; but, according to Dr. DUDLEY, an improperly-worded or an unreasonable specification is a most potent cause for the tender of unsatisfactory materials. The mistakes of subordinates are a further cause of what may seem to be fraud. Another cause is that commercial processes do not always yield what is expected of them. Dr. DUDLEY examined in his laboratory a shipment of phosphor bronze for bearings. The material is an alloy of copper, tin, lead and phosphorus. The analysis showed that the phosphorus was inadequate, and the shipment was rejected. A member of the firm called and was able to produce evidence of the purchase of phosphor tin at a high price which was employed. But he was not aware that at every melting some of the phosphorus evaporated, and in that way the defect was explained. Contracts are accepted by manufacturers in the belief that if they cannot produce such a material as is

specified they will supply one that is just as good. That reasoning might have served at one time, but under the new condition of business in America it has no value. The specification is the standard from which there can be no departure.

But how is the specification to be enforced? Dr. DUDLEY says the examination and testing must be of such a kind as to leave no loopholes for evasion or the substitution of inferior materials. If the producer is to be trusted in one way, he may as well be trusted in all. The samples should not be selected by a producer. They should be taken at random by whoever represents the testing. Once selected they should not be allowed to remain with the producer. If the sample fails in the testing the material should be rejected. In Dr. DUDLEY's practice there is no provision for second or third tests. In the early days something of that kind was allowed. But now testing has arrived at such a perfection one trial is sufficient. If three are tolerated, why not seven or nine?

The fact is recognised by Dr. DUDLEY that the chemist's methods are not always infallible, and physical tests are not without their imperfections. He does not reject a material until the operations have been repeated, and probably three or four times. It may be stated that there are errors in testing for which allowance should be made, or the terms of the specification should be altered so as to correspond with the deficiency of the testing. What is to become of the material which is below the standard it is not the business of the experimenter to consider. The architect or engineer should take care that defective materials are not employed in any of his structures. And Dr. DUDLEY considers the time is not far distant when for all important structures it shall be made known that they have been tested, and that disasters cannot arise from defective materials or ill-arranged construction. Of course every business tries to make itself essential, and testing is gradually becoming not only a special business but a profession which requires a long course of training and the possession of special qualifications. How people were able to exist and safely meet together in crowds within ancient buildings must now appear to many as indications of a special providence. But the old empiric rules aided by honesty formed a force which even in these scientific days can still accomplish great undertakings.

#### THE INSTITUTE IN EDINBURGH.

ON Friday last the members of the Royal Institute of British Architects, who visited Edinburgh, were conducted through the Castle by Mr. H. J. Blanc, St. Giles's Cathedral by Mr. Thomas Ross, the Parliament Houses and Holyrood by Mr. W. T. Oldrieve. In the evening there was a dinner at the Caledonian Railway Hotel. The *Scotsman* gives the following report of the speeches:—

The loyal toasts having been honoured, Mr. Stokes proposed that of "The City of Edinburgh." He commented on the high standard of the architecture, and particularly of the modern architecture, of Edinburgh, and expressed the thanks of the Institute to the Lord Provost and Council for their hospitality.

Lord Provost Gibson, in replying, observed with reference to comments that had been made on building regulations that the Lord Dean of Guild and his Court were at present considering still more stringent rules. These were essential and necessary if they were to maintain in Edinburgh the prestige they already possessed of having magnificent streets and fine architecture. They had a spirit in modern times which desired to turn the last penny to account, and it was that they feared—in the narrowing of thoroughfares by the erection of overpowering buildings on both sides. It was that they desired to restrict.

The Lord Justice-Clerk, in proposing "The Royal Institute of British Architects and the Allied Societies," said he was sure those who had taken them about the city that day had taken them past the things they ought not to look at, and concentrated their attention on those things which were worthy to be remembered. There were things in Edinburgh which were worthy to be remembered. They would agree that to come to a city celebrated by the names

of Adam, Playfair and Hamilton was to come to the right place. What these men did was a strong and lasting protest against the state of things which existed for a considerable time before they began to exercise their art, he might say their genius, in improving the architecture of the city. There were no people in the world with whom he personally had more sympathy than those who belonged to the profession of the architect. All other workers in art did pretty much what they liked. The poor architect might stand in front of his own work and tell everyone who passed how he had been cut down as to the money he had to spend and how he had been squeezed by public bodies and others to add what they thought would be an improvement, but what he thought would be abominable. He was glad to say they had a great revival of public taste and a great cessation of the ordinary practice, which existed a good many years ago, of everybody, whether he had taste or not, expressing his opinion and urging his views about everything that was done in regard to the architecture of the city in which he lived. There was a great improvement, no doubt. He was not going to enlarge on that, but being a practical man he would like to say a word to the architects all over the country as to what they ought to do with their buildings. An architect erected a beautiful building, the admiration of all who saw it. Happy were they who saw it before it had been interfered with. If he returned three or four years afterwards he would find it probably plastered over with notices and with abominable posts with square boards on the top stating that this was the work of so-and-so, and the price of admission into it is threepence. It was enough to make the architects of St. Giles's rise from their graves that the Ecclesiastical Commissioners of the city kept the doors of that church shut against everyone who wished to go in to see the beautiful architecture, and, it might be, sometimes to sit down and reflect in the quiet of that noble building. But those men at the door, with a demand for threepence in order that nobody but the aristocracy shall be able to get in. He should like, in going into that church, rather than find it empty except for a few empty-headed tourists talking irreverently, to see a lot of poorly-dressed old women going in there in the course of the forenoon, going in quietly and thinking a bit. It might do a great deal of good to a great many of them, and the church would look far better for it. He would suggest to the Lord Provost that he should consider whether it was right that the noble building dedicated to the worship of God should be a place where people had to pay before they could go in. Then at Westminster Abbey, what did they see? A notice, "In this way," "Out this way." Inside they saw an enormous number of big placards in five or six languages describing the buildings and tied round the pillars. There were worse things than that in Westminster Abbey. He hoped they would all set their faces against the practice of loading the walls of beautiful churches with execrable monuments and tombstones—splashes of soapsuds that were intended to represent crowns, with impossible angels and somebody lying in a dress made in the time of Queen Elizabeth. He thought an architect should make it a stipulation, before he erected a building, that nothing would be put in it, and no niches would be cut in the walls without his approval and consent. Why did we always surround our buildings, about 2 feet off from the edge of the building itself, with a railing which disfigured the building, and had no other effect but to form a receptacle for old hats? And if there was anything to clear out, the scavenger had to climb the railings to remove it. At one time St. Giles's was enclosed with wrought-iron railings, which he did his utmost, and ultimately succeeded, in getting removed. He would never have been able to get the railing removed unless he had told the Commissioners it was splendid wrought-iron, and anyone would give them something to be permitted to take it away. A contractor gave them 25*l.* for it, and he was allowed to take it down. He could mention a great many cases in Edinburgh in which that had happened. For the citizens of Edinburgh he might say they were delighted to see the members of the Institute.

The Chairman, in replying, spoke of the undesirable effect of some of the stained glass they saw in ecclesiastical buildings, and urged that a Bill should be passed which would enable municipal authorities to put the development of the suburbs under proper control and prevent them being left to the baneful greed of the ground-rent speculator.

Mr. J. S. Gibson proposed the toast of "Edinburgh Architectural Association."

Mr. Hippolyte J. Blanc, in responding, said when the Edinburgh Association was instituted fifty years ago there

were nine members. To-day the public appreciation of it was evidenced by the increase of membership to nearly 400. It had always been an Association of architects and collateral members—an amalgamation which had been the strength of the Society.

Mr. John Slater proposed the health of the guests and Sir James A. Russell responded.

#### ROMAN VILLA, PETERSFIELD.

ACCORDING to Mr. A. Moray Williams, of Bedales School, Petersfield, the excavation of the Roman villa at the Stroud has now reached an interesting stage, and one wing of what must be a very large house has been laid completely bare. This wing contains about a dozen rooms, three of which were heated by hypocausts, and in one may be seen the rare feature of a wall still lined to an extent with large and unbroken flue tiles. Many of the floors are still well paved with tesserae. Several coins of the late empire have been found, and various small finds of an interesting nature, including objects of iron, glass and pottery. From the latter it has been possible to reconstruct almost completely a fine vase of New Forest ware 12 inches high.

The excavation, as it stands, covers an area of about half an acre, in which space, in addition to the wing already mentioned, two long walls of the courtyard have been laid bare, while more rooms and foundations are every day being brought to light. One long corridor has a mosaic pavement, some portion at any rate of which it is hoped to find intact. The site is now open to the public, and will remain so probably until the end of August. Towards an estimated expenditure of 23*l.* the Society of Antiquaries have subscribed 5*l.*, and Mr. T. H. Harvey, of Fareham, 2*l.* 2*s.*, while other subscriptions amount to 2*l.* 3*s.* 6*d.*

The villa lies a short mile west of Petersfield, one field back from the main Petersfield-Langrish-Winchester Road.

#### WISLEY, PYRFORD AND NEWARK ABBEY.\*

THE country between the river Thames and the places we have visited to-day presented a very different aspect when they flourished than it does now. It probably consisted for the most part of forest, moor and swamp, which was a happy hunting-ground for the king, being an easy excursion from Windsor Forest, and, being wild, was very sparsely populated.

Hence no great provision had to be made by the missionary fathers who mapped out the country with a view to its spiritual needs, accordingly the churches we have visited are very small and simple.

There appears also to have been no wealthy or powerful feudal lord in the immediate neighbourhood, to extend the parish church by building in memory of his forbears or spouse a memorial chapel to presently become an aisle of the local sanctuary; hence both Wisley and Pyrford are to-day practically the same as they existed 700 or 800 years ago.

Both founded in the twelfth century, they present many similar features—shingle-covered, timber-framed belfries give a quaint and picturesque appearance to the exterior; stucco-covered rubble walling partly of ironstone nodules from the gravel drift formation of the district; Bath or Caen stone dressings outside, and clench or block chalk inside, with the coarse plastering common in that day, which originally was decorated with rude fresco-paintings, some of which are noticeable, particularly at Pyrford.

Wisley has undoubted signs of a leper squint (which has been blocked up) in the south chancel wall. The Norman chancel arch and window reveals are undoubtedly original; the quaint old porch is interesting, but has few distinctive features. There is a curious record in a register I found here to the effect that, the churchyard in 1786 wanting a new fence, the parishioners clubbed together and contributed so many panels each. The building dates from 1150 and has one bell. The restoration has been carefully and wisely done by the Buxton family of Fox Warren, who hold the manor, one of whom is the present Postmaster-General, Mr. Sydney Buxton.

Pyrford, perhaps, may claim more interest than its sister church on account among other things of its unique position. It stands on a bluff overlooking the very green and well-watered valley of the Wey river. The north doorway is a particularly good sample of the sculptured Norman arch with its zigzag architrave ornament. The porch placed

\* Read at a meeting of the Upper Norwood Athenæum on May 25, by Mr. Frederick Higgs.

there in Tudor times, was not made wide enough to clear the eastern jamb, the mouldings and column of which it partly covers; it remains in very excellent condition and is

WISLEY PARISH CHURCH.

in itself very interesting. In pre-Reformation times the western jamb column was utilised as the base of a holy-water stoup, which has been half cut away. The chancel arch, like that at Wisley, is clearly original, as also is a large quantity of the timbering of the roof. The pulpit is very beautiful Jacobean, and bears on it the date 1628. The corbel in the centre of the south nave wall probably supported an image before the Reformation. The building has been carefully restored without eliminating any of its characteristic and ancient features. There is some very good sixteenth-century panelling in the north-east corner of

ST. NICHOLAS CHURCH, PYRFORD.

the nave, and old material has been rebuilt into many of the piers. Neither here nor at Wisley is there any sign of piscinae, and it is very likely that they have been filled up, but in any case it is quite evident that the ceremonies of worship carried on were always of the plainest and simplest character.

The west end wall has a huge buttress against its centre, probably to counteract the swing of the bells, and each side, near its top, is a small slit window of Norman type. It is difficult to read any meaning into the wall frescoes, which are, relatively to the size of the building, rather extensive, but some of the colours retain their vivid character. On the north side of the church is an old yew tree which, although a baby by the side of the patriarch we saw at Aldworth two years ago, must have seen several centuries.

From the south side you have an uninterrupted view over the Wey valley and the intervening country to the North Downs, and both Ranmore and St. Martha's can be seen on a clear day. It is a little God's acre both picturesque and beautiful. The present building was founded in 1150; it has two bells and is dedicated to St. Nicholas.

We now consider the romantic ruins of the old priory of Newarke, New Stead, or New Place. Little comparatively of the superstructure exists to-day, but sufficient remains to indicate that it was an establishment of considerable size and importance, where friars of St. Augustine's Order lived in fair comfort, if not in great wealth. Little

TUDOR PORCH, PYRFORD.

appears to be known of its history, as it is not mentioned in many records. I have, however, come across a plan which was prepared some years ago from the old foundation fragments, assisted by what is known of similar buildings elsewhere, and this has proved of great assistance in examining the ruins; without it, as in my many former visits, the remains are largely unintelligible.

In a work called "The Beauties of England and Wales," published in 1813, it is mentioned as having been founded during the reign of Richard I. by Ruald de Calva and Beatrix de Sandes, his wife, and by them dedicated to the Blessed Virgin and St. Thomas of Canterbury; this establishment and the endowments connected were subse-

NEWARK PRIORY RUINS, LOOKING E.N.E.

quently confirmed by Henry III. and Edward I. At the Dissolution by Henry VIII. the endowed revenue amounted to 258*l.* 11*s.* 11*d.* per annum. The last prior dispossessed

at that time was one Richard Lippiscombe, who received a pension of 40*l.* yearly. Henry gave the lands held by the monastery to Montacute, from whom they passed to the Onslow family, and eventually came into the hands of the present owner, the Countess Lovelace, of Ockham Park. For the plan and for the foregoing extract I am indebted to Mr. Webber, who farms the land on which the ruins stand, and who, together with Mrs. Webber, takes considerable interest in the remains. I hope, therefore, he will act on my suggestion that he should remove the stone coffin lid now used as a piece of paving stone at the site of the west gateway to the abbey grounds and place it within the enclosed precincts. I was informed that the Vicar of Ripley has instituted an annual service in the old choir, which is interesting to hear.

NEWARK PRIORY: VIEW FROM S.E.

One peculiarity noticeable in connection with this building is that the transepts were separated at their lower part from the main building by a thick wall 10 feet high, so that they became to all intents and purposes separate apartments, approached only through lobbies from the main aisles. The opening shown on the plan at the north-east corner of the cloisters is, I think, a destructive work of recent date. Each transept appears to have had an oratory chapel of its own, and it is quite clear to-day in the one on the south side, where the piscina stones have been removed. All the dressed stones, or nearly all, have been taken out, leaving little but the immensely thick rubble walling standing.

NEWARK PRIORY: VIEW FROM N.W.

In all probability the nave stretched westwards 100 feet or more, and now that the owner and occupier are showing some interest in the building, having quite recently fenced it in, it is to be hoped that some exploratory excavations may be taken in hand with a view to the tracing out of the

whole extent of the building foundations which most certainly exist below ground.

A fragment of the wall adjoining the old entrance gate is still visible direct west from the centre of the church; it is an interesting specimen of stone and flint facing in diaper squares; abutting on this is what I believe to be the original arch over the fosse outside the boundary wall, and upon this is placed the old coffin lid I have referred to.

It was at this entrance gate that, according to the narrative by Martin Tupper, Stephen Langton, afterwards Lord Archbishop of Canterbury and champion of popular rights against the brutal despotism of King John, knocked after the tragic rescue of sweet Alice Foyle from John's clutches at the burning of Tangle Manor, and whose supposed death caused him to crave admission and to enter the ranks of the Brotherhood. Through this gate Stephen passed when later on he took up his solitary duty as first monk in charge of the new chancel at St. Martha on the Hill by Guildford yonder, specially consecrated to him as the depository of the lovely Alice's supposed lifeless body. King John himself with his lawless boon companions probably often knocked here to demand blackmail, or as much as he dared, from the sacred precincts, the whole district affording a happy hunting-ground for the monarch to disport himself in the chase, varied by an occasional foray upon a defenceless hamlet and even on the homes of some of the less powerful barons or landholders.

The boundary wall of the abbey grounds can still, I think, be traced on the north and east sides in the mound or hedge bank under the grove of elms.

NEWARK PRIORY: DOORWAY FROM LOBBY TO SOUTH.

Care of the ruins has come all too late, as for centuries they have been used as a quarry from which to easily obtain material for farm buildings, &c., and the flint rubble for road-making and repairs. A piece of the north flank of the Homewood farmhouse itself is eloquent evidence to the truth of this, and there may be many others.

Newark Priory and St. Catherine's Nunnery, at Guildford, who very likely frequently exchanged deputation visits, being near neighbours, and the chapel of St. Martha, in the duties of which both were interested, form a most interesting trio of ecclesiastical relics of which this district of Surrey has reason to be proud. The monastic life, then the vogue, which in these strenuous days seems so selfish and futile, produced in the shrines in which they worshipped monuments of the architectural skill and art of Mediæval times which are in most cases still subject of wonder and admiration to our eyes, and in the case of the parish churches gratitude also, both to the zealous missionary churchmen who first erected them, and to the sturdy yeomen of our land who have from time to time preserved them from total destruction and decay, and I trust that in the investigation of the two quaint and simple shrines and the romantic ruin, each in its beautiful sylvan surroundings, our time this afternoon has not been altogether misspent. I am indebted to you, my fellow members, for a good attendance, and to our indefatigable secretary for again tendering to me his valuable help.

## NOTES AND COMMENTS.

WE lately referred to the exploration at Lindos in Rhodes which the Danes have undertaken. One of their latest rewards is the discovery of a great relief representing the stern of an antique war vessel. As, like the *Dying Lion* of THORWALDSEN, it was carved on the face of a rock, it is believed all the parts are of a size corresponding with those of an actual vessel. It is inferred that the rock served as the base of a statue of some renowned captain, known as HAGESANDROS, the son of MIKION, whose deeds, however, are not recorded in any history which has come down to modern times. The sculptor was PYTHOKRITOS, one of the Rhodian artists who lived 170 years before the beginning of our era. There is fitness in the discovery by the representatives of a seafaring people, and the Danes will be inspired to further efforts in Greece.

THE judgment delivered by Mr. Justice LAWRENCE on Tuesday in Manchester suggests that what has been said of late about secret commissions is not without influence on a practice which is accepted by many architects. In erecting a building in which machines are employed it is not always certain that although an architect may have some work in connection with them he will be paid a commission on their cost. He is looked upon as the designer of the case, and any trouble which arises in connection with machines and appliances is not reckoned. If the architect informed his client that a charge would be made on account of such work, the client would have the opportunity of declining the architect's services. The whole question turns on the extent of the knowledge possessed by the client. In the case which was heard before Mr. Justice LAWRENCE on Monday and Tuesday, Mr. TEMPERLEY, of Bolton, claimed 614*l.* 15*s.* 6*d.* for the preparation of plans and other work required in connection with a mill which the Black Rod Manufacturing Company proposed to erect. The tenders for the building were higher than had been anticipated, and the directors offered the architect 400*l.* in payment of his claims, and when he declined to accept that amount he was dismissed. The plaintiff's claim was 5 per cent. on the building contract and 2½ per cent. for quantities, besides 5 per cent. from contractors for boilers, engines, mill-gearing, iron and constructional steel. The defendants counterclaimed for any moneys the plaintiff might have received for such commissions, alleging that they were wrongful. Evidence was given that the payment was usual, although sometimes it was a matter of arrangement. Plaintiff's counsel argued that the two principal promoters were told of the arrangement, and their knowledge of the facts was enough to show there was no fraud attempted. Mr. Justice LAWRENCE said plaintiff's employment as architect would entitle him to 5 per cent. commission on the total cost of the erection, including both building and machinery; but the evidence disclosed that whilst the company would be liable to him for 5 per cent. on the whole, he was getting other 5 per cent. from the contractors, which he had not disclosed to the company. It was for the plaintiff to show that he communicated to the company the fact that he was making these arrangements with the contractors. His Lordship therefore considered that the plaintiff had not made out his case, and judgment must be entered for the defendants. A stay of execution was granted.

THE witnesses appeared to be surprised that there should be any objection to the practice of a sub-contractor allowing 5 per cent. commission to the architect on his tender. There was no secrecy about it, and it was taken for granted that the company knew the circumstances. One witness said that he informed one of the promoters that he had added 5 per cent. commission, which was all the architect was to receive directly or indirectly. An architect agreed that there should

have been an agreement with the company on the subject, and another said it was purely a matter of arrangement. From the evidence it may be believed that sub-contractors are assured that an architect only receives 5 per cent. through them, and that the payment corresponds with that for quantities—which comes from the builder. It is evident, however, from what was said by his Lordship that henceforth such payments will be regarded as secret commissions, and unless an architect is able to show that he has made his client aware of what he expects and that he has performed definite duties for such a commission, he will run the risk of being nonsuited. The architectural societies would do well to have the law on the subject under the new conditions fully explained for the benefit of their members. In the Black Rod case the architect did not receive any remuneration for five or six months' labour.

IN addition to several paintings by foreign and English masters, some examples of ancient sculpture will be sold at Trentham Hall, the seat of the Duke of SUTHERLAND, on Friday next, being the third day of the sale. One is a Roman altar or font, 4 feet 2 inches high, standing on massive supports, with lion claws. It does not correspond with any of the examples seen in museums. The representation of the Signs of the Zodiac in relief is curious. Another Roman font stands on wing trussed supports. A Roman altar of a solid kind, with rams' heads at the angles and large garlands between them, has greater unity. A marble statue, 6 feet high, of a woman has no sign of a goddess, and on that account is as attractive as any of the figurines of Tanagra. A statue of HYGIEIA is also without the customary severity, and there is some novelty in having one of the feet resting on what might have been a medicine chest. There is a perfect figure of an APOLLO in a contemplative attitude. The gardens at Trentham were enriched with copies of ancient statues and vases, besides a few elegant fountains. All these should be acquired, if possible, for public parks.

LIVERPOOL, LONDON AND GLOBE INSURANCE CO.'S OFFICES,  
CORNHILL, E.C.

BRITISH MUSEUM EXTENSION.

THE SPREAD EAGLE, BLOKWHICH.

THE SALOON OF THE ROYAL MAIL STEAM PACKET COMPANY'S  
NEW TWIN-SCREW S.S. "AVON."

THIS magnificent craft has a length of 535 feet, is 62 feet in breadth and 43 feet in depth, with a gross register of 11,000 tons. The builders are Messrs. HARLAND & WOLFF, of Belfast. The internal fittings by Messrs. GEORGE TROLLOPE, COLLS & SONS, LTD., and other firms are graceful and beautiful. The state-rooms, sitting-rooms, smoke-room and the *cabines de luxe* are the most luxurious we have seen, and the colourings very chaste. A great boon is the perfect system of ventilation throughout the ship. The social hall, with its double folding doors opening on to the promenade deck, provides every facility for various pastimes and games. The entrance hall, leading to the dining saloon, is, as in the case of the other chief reception saloon, well lighted and perfectly ventilated.

NEW GOVERNMENT BUILDINGS, PARLIAMENT STREET.

IN the description of the new Government Offices in Parliament Street, which appeared last week, it was omitted to be stated that the whole of the Portland stone which gives character to the buildings—for, with the exception of St. Paul's Cathedral, no other example could be found in London containing half a million cubic feet of the material—was supplied from the Coombefield quarries, at Portland, of the Bath Stone Firms, Ltd. The same firms also supplied the stone for the War Office buildings.

## THE PALACE OF PEACE.

IT is to be hoped the deliberations in Mr. Carnegie's Palace of Peace will be accepted with more unanimity than the selection of the design for the building has produced. Several Dutch architects have protested in an address to the States-General against the site, the conditions of the competition and the decision of the jury. Respecting the site they say:—

In choosing the site for an important public building a restful environment has always been aimed at, and such a distance from the public road that a worthy view of the building was insured, the approach thereby conducing also to impress the visitor. A study of ancient cities yields the conviction that the Greeks and Romans in their time set their temples and other public buildings amid stately environs, and, moreover, took care that there was still sufficient space to show up these buildings to the best advantage. A study of the closely-built cities of the Middle Ages shows what laborious care even at that time was expended to gain a distant view of cathedral or town hall from all sides, with the result that we can still admire that idea. The Renaissance, and particularly the eighteenth century, afford the best examples of this, and even our land, that is certainly not overloaded in the matter of monumental architecture, has abundance of examples from this period, especially among its large country seats.

But one might even go further. Many buildings of Eastern architecture might be approached only with the greatest reverence, and so they were shut off from the profane world by a large court in front, or were enclosed in a sacred wood, within which no other building of any kind whatever might be erected. To-day, in these days of more material emotions, there is probably no room for such considerations, and one runs great risk, in even alluding to them, of being answered with a pitying shrug; nevertheless, one might ask if a little more insight might not have been applied in choosing the site for the Palace of Peace. It is for this reason that we wish to point out once more, as has already been done by the publications of our profession, the many disadvantages connected with the site fixed upon.

The building site takes in only a small corner of the park of Zorgvliet, and that the least suitable part, which meets not one of the above-mentioned requirements. The ground is in itself already much too small to allow of the laying out of a park of any size, while the situation makes it, moreover, impossible to get sufficient distance for the so highly desirable perspective view. It has defective approaches, there being no avenue to lead up to it, and it lies, moreover, to the north, so that a shadow effect on the building, which in every period has been an object of care, is precluded. The most serious of all, however, is its immediate environment, the proximity of station and steam-tramway and the extreme probability that in a few years the whole park will fall a victim to building speculators, which, as everyone knows, means the ruin of the entire vicinity. Why had it not been possible to devote the whole park, or at least the greater part of it, to the Palace of Peace, with the building lying at the end of the present avenue? We are therefore of opinion that now Holland has the opportunity of seeing rise within her bounds an institution like that of the Palace of Peace, an institution which the whole world will envy us, every effort should be expended to produce that monument in the grandest manner and worthy of its lofty ideal.

Concerning the conditions it is remarked:—

The first article of the programme, as it was finally published, reads harmlessly enough:—"The competition is open to architects of all lands. The committee of the Carnegie Foundation will, nevertheless, specially invite several to take part in the competition," thus a compromise between a public and a restricted prize competition. The fact that invitations were sent to certain architects, to which invitations a large fee was attached, was the source of profound discontent and great difference of opinion. The payment of a number of chosen architects made the competition unequal. The means were put within reach of those competitors to devote themselves wholly to the work at the cost of the committee, and besides to employ all available mechanical, intellectual and artistic help. An argument based on the inequality of means, which, as everyone knows, already exists, can never, in our opinion, be attended with success. It can never be justifiable to increase, artificially and perceptibly, the inequality occasioned by circumstance. On the contrary, a spirit of justice would rather have diminished, as much as possible, the existing disparity in this prize competition. This might have been

accomplished by the purchase, at a reasonable price, of a certain number of deserving plans which obtained no awards.

It will probably be observed that a competition with such heavy calls on time and money is practically open only to architects of means, and not to those who have only their leisure hours to expend on it. In connection herewith another and important grievance is touched, namely, that it is not quite fair to require such an exceedingly and unnecessarily great amount of work from competitors who, with the exception of a very small number, cannot expect any remuneration whatever. This leads to the waste of a considerable amount of labour and money that might have been more profitably expended. The far too comprehensive requirements added to the limited number of prizes must have deterred many from competing, thereby lowering the standard of the competition. How easily might this waste have been avoided by first inviting plans for a sketch prize competition, an "Ideen-Wettbewerf," before the final match to be held between the winners of the preliminary competition.

At the head of the programme the building sum was clearly stated, viz. 1,600,000 florins (135,000*l.*). It is quite clear that competitors and jury should have reckoned with this sum, in spite of the fact that not one estimate, not even in the rough, had to be sent in, nor were the local prices of materials and wages mentioned in the programme.

The programme had, moreover, more radical faults. The hope that the choice of a site would ultimately be satisfactorily settled was not fulfilled. Not until after everyone was tired of the endless quarrelling, and, cost what it might, an end had to come to the chopping and changing that evoked the mirth and vexation of the whole world, was the piece of Zorgvliet finally bought for 700,000 guilders (60,000*l.*)—a site that is but poorly suited to an evolution in architecture answering to the conception of a Palace of Peace.

But one might have tried to make the best of the rest of the programme. In our opinion, then, a perceptible want in the programme is felt by the absence of any information, indispensable to the foreign competitor, about the environs of the Zorgvliet site. A programme on slightly broader lines would have enabled the designers to plan and to place the building to the best advantage as regards the present streets, &c., and to make it as far as possible a part of the general plan of the town. Whereas only a purely abstract and theoretical solution has been the result.

A no less serious grievance is the way in which the answering of questions and the giving of information took place quite in private. This ought to have been public, in a publication appointed for the purpose, so that all the competitors could have benefited equally from the information which should have served to supplement the programme or to explain its meaning. Moreover, it was not stated in how far the jury were to consider themselves bound by the information tendered by an adviser of the Carnegie Foundation. Finally, we would point out how unfair it was, especially towards the foreign competitors, that the programme was published only in The Hague. For competitors in other countries the time limit was thus shortened by the time required for sending for a programme. Equally unfair was the stipulation that the plans had to be sent to The Hague on a certain date; justice to the competitors had required the plans merely to have been posted, as the postmark would have shown, in the place from which they were sent in before the closing of the time limit.

Without further enlarging on points of lesser importance, it will be clear from the above that the programme showed several distinct shortcomings, which, in the case of a prize competition of such importance, might have been avoided by consideration and forethought. We therefore testify that on several points the programme sets at defiance all existing prize-competition regulations in England, France, Germany and Austria.

With respect to the results of the prize competition the following facts may be called to mind. In the competition 216 entries were received and were judged in a few days by an international committee, the issue of which is now known. If in architectural circles the opinion was almost unanimous that the competition had been a failure, the manner in which the jury acquitted themselves of their task has very rightly aroused a widespread indignation at home and abroad, which has found universal expression, not only in architectural publications, but in the Press in general.

In more or less plain speaking, the work of the jury is condemned for the following reasons:—1. The issuing of a

totally inadequate, self-contradictory report. 2. The disregarding of the regulations laid down as binding in the programme by awarding prizes to plans in which these regulations were not followed.

As regards point 1, in the report issued by the jury and adopted by the Carnegie committee, a serious criticism of the plans sent in is wanting. Had it not been possible to remark on all the plans, the jury should have discussed at least the leet of sixteen from which the final choice was made, in order to make clear on what grounds the choice of the jury was finally based.

In the report issued by them are merely some generalities without any significant bearing on the question, and reasons which clearly show that the awarding of the prizes took place contrary to the regulations of the programme, and in defiance of the fundamental rules of beauty in architectural conceptions.

Limiting one's self now to the two plans awarded respectively the first and second prizes, the jury's report speaks thus of Cordonnier's plan:—"This plan displays a fine general ordonnance. The designer wishes to give expression to the idea that, as The Hague was chosen as the seat of the Court of Arbitration, the architecture of the Palace of Peace should be inspired by the Dutch style of the sixteenth century. This it was which finally procured a majority for this plan. The ground-plans met the requirements of the programme and separate, as was required, the library from the palace, though by so separating them the architect has failed to preserve the so desirable character of a whole architectural harmony."

And apart from the striking circumstance that in reality Cordonnier's plan is very unlike the Dutch architecture of the sixteenth century, the standpoint adopted by the jury by which the awarding of the first prize was decided in favour of a particular style is contrary to the programme which left complete freedom in this matter.

Still, the mere fact that the jury themselves had to confess in connection with this plan that it lacked "the so desirable character of a whole architectural harmony," a quality indispensable to raise a work to a work of art, renders the awarding of the first prize to this plan incomprehensible.

In respect to the plan which gained the second prize the jury declared themselves as follows:—"Only the general arrangement attracted the attention of the jury. The grouping is very good. This is clearly the plan of a palace lying in a park; the large halls get a side-light, and the arrangement of the rear building (containing the rooms for the library) round an enclosed court, in the style of a convent garden, is excellent. It is a matter for regret that the too pompous style, as much in the ground plan as in the drawing of the gables, is not in keeping with the character of stately simplicity befitting the architectural embodiment of a Palace of Peace, without showing either any originality." And in spite of the significant censure that the plan had not the character of a Palace of Peace, and, moreover, lacked all originality, it was awarded the second prize.

That the jury had mistaken their task is also shown in the following passage borrowed from the report:—"The 216 plans sent in represent three distinct types of arrangement. On some of the plans the library and the court of arbitration are housed in two separate buildings, connected only by a corridor. On others they form one building lighted from the sides, in some cases from outer courts which are shut in on three sides only, or lighted from one or more inner courts shut in on all sides. From these plans the jury had to choose six, which, after becoming the property of the Carnegie Foundation, would serve the committee as a basis from which, in conjunction with an appointed architect, to compose one plan suitable to be put into execution. Proceeding herewith six plans were selected which, in the opinion of the jury, represented the different systems of arrangement."

In the programme of the prize competition no regulation was inserted that could justify this singular standpoint; even if it had been taken up, it would all too speedily have proved untenable, for it is impossible from six different systems of arrangement, which after all have not been formed by chance, to make one good architectural whole.

In respect to point 2, the ignoring of the programme regulations, the jury ought to have considered that no prizes might be awarded to plans where one of the most important regulations of the programme, viz. that of the building sum, was disregarded. The jury, however, have notwithstanding awarded prizes to such plans, and have thereby transgressed

article 5 of the programme, according to which article a plan which does not duly meet the regulations of the programme cannot come into consideration for any award.

The fact, moreover, that great economy, coupled with entire remodelling, would have to be applied to the original prize plan, in order to bring it ultimately within the limits of the proposed expenditure, is sufficient to prove that the author of the prize plan in designing it had not thought for a moment of reckoning with that sum. A like disregard of the proposed building sum can also with reason be asserted more or less of the other five prize plans.

In the prize plans, moreover, the jury have allowed the following deviations from the programme:—

1. A non-compliance with the prescribed measurements and situation of the rooms mentioned in art. 14 of the programme.

2. An exceeding of the limits of the ground given on the sketch-map attached to the programme, while art. 13 fixes a certain limit.

3. A different treatment from that prescribed under heading of art. 2.

Taking all this into consideration there is certainly cause to sign a protest against the decision of the jury which was accepted by the Carnegie committee, a protest condemning the way in which the jury acquitted themselves of their task, where they fell short in their obligations towards the many architects of all countries whose participation in the competition evinced a confidence in the strict justice of those who had to sit in judgment on their comprehensive and laborious work.

## CONCRETE WALLS AND FLOORS.

ARCHITECTURE is the art of building. It may be a fine art, if beauty is one of the points studied. Beauty has a natural basis in utility. Utility depends mainly on economy. Hence, if this art is in a high state of perfection the buildings will be beautiful and will be economically constructed. The economy of the builders' art is usually placed in the hands of an engineer. He should work with the architect (the artist) during the evolution of the plans, so that the final ones for the structure may combine a maximum of beauty, utility and economy.

No art is stable. Every art finds its basis in human needs. Needs increase the higher and more complex the civilisation. Arts should therefore be constantly evolving to keep up with the development in society. New materials require new methods of treatment. Strict adherence to old forms with new materials does not permit a maximum of economy, is not therefore most useful, and thereby loses in that which is the basis of real beauty.

Concrete has been used for buildingwork from ancient times. Its adaptation to modern needs, however, has been actively exploited only very recently. The development so far made is enormous, but there is every evidence that the growth is still very young. The wide adaptability of concrete is proved by its varied use at the hands of its enthusiastic exploiters. The perfection in the art of its use must depend on an intimate knowledge of its characteristics so that the utmost advantage may be taken of its good points and that its poor qualities can be hidden or overcome. These qualities may be summarised as follows, say Mr. E. P. Goodrich in the *American Architect*.

**Good Qualities.**—Concrete consists of materials of comparative cheapness and almost universally obtainable. It hardens quickly in the shape imposed by surrounding conditions. Its plasticity when very fresh allows the introduction of steel rods to distribute the setting shrinkage. It has practically the same coefficient of temperature change as steel, so that there is little danger of separation of concrete and embedded steel from such cause. It is high in compressive strength, especially per unit of cost. Its plasticity when fresh and its shrinkage during hardening give it a firm grip on embedded steel, so that the latter may be profitably introduced to increase the low tensile strength. It is monolithic and adamant when it reaches the age of only a few weeks, if properly made. Is highly fire, water and acid resistant.

**Poor Qualities.**—The whole value of work erected in concrete depends upon untiring supervision, the most careful workmanship in mixing, placing and compacting the concrete and installing the reinforcement. Shrinks slightly during the hardening process; is low in tensile strength; its plasticity when fresh makes its exterior appearance almost entirely dependent upon the nature of the material confining it during the process of hardening. The nece

sarily universal distribution of the cement through the whole mass gives the exterior natural surface a dull grey colour. Variations in mixture, impurities in the water, variation in the colours of the aggregates, produce gradations in the dull grey colour, irregular in amount and in superficial extent.

Except those having to do with its external appearance, the poor qualities of concrete can be almost entirely counter-balanced by its good points, provided the latter are properly handled by one thoroughly familiar with both the poor and the good qualities. To obviate the objections to the natural superficial appearance of mass concretework, some artificial surface-treatment or the introduction of coloured ingredients is necessary. The monolithic and fire-resistant qualities make concrete especially valuable for residence work, since such buildings will be exceptionally long lived, free from vermin, sanitary and fireproof.

Certain types of construction, devices of erection and methods of design are peculiar to each kind of building material, and to make the best use of any special kind the several peculiarities must be known and advantage taken of them while designing work. Very often details of arrangement and of decorative effect can be so modified as to take advantage of such peculiarities and give most satisfactory results. There follow some of the characteristics of concrete and reinforced concrete and the possible means necessary to take advantage of the good ones and obviate the poor ones—especially with reference to residence construction.

#### *As to Walls.*

Under certain circumstances concrete, like brick, will absorb a considerable amount of water, which will be given off again under natural conditions. This necessitates resorting to various devices in connection with concrete outside walls of dwelling-houses to make them less absorbent and more impervious to water. The thicker the wall the less pervious it is, but heavy walls have obvious disadvantages. The more cement employed the more impervious the wall, but cement is costly. The larger the size of the aggregate used the more impervious, to some extent,  $2\frac{1}{2}$ -inch stone giving one-third better results than  $\frac{1}{2}$ -inch. Large gravel is many times better than large stone. Various foreign substances may be introduced into the concrete to assist in this point. Alum, lime-paste, soft soap, lye, &c., are variously advocated, but their addition is usually detrimental and their action not well known. Several patent compounds are also on the market. Superficial treatment can also be employed. Either the outside or the inside can be plastered with special cement preparations. Several are advertised as almost perfect in quality. Careful troweling, like cement side-walk finishing, is very effective, as it produces a dense layer on the surface. Asphaltic and other so-called waterproofing paints have been devised, and when amply applied to absolutely uncracked surfaces are moderately effective. The construction of walls with an air-space is probably the best device, as the dead air also serves as an insulator against loss and entrance of heat in winter and summer respectively. The usual furring applied to brick walls is an effective method, but somewhat more costly than some others. Hollow concrete, terracotta or composition blocks are also useful for certain walls where plaster is to be applied to both sides. There are also several systems which produce hollow monolithic concrete walls at reasonable cost. With these, burlap, paint or other varieties of interior decoration can be applied directly to the inner face of the walls without the expense of plastering. At the same time, the outer face can be finished in any desired manner.

Concrete shrinks while setting. Also, of course, with fall of temperature. This shrinkage cannot be obviated; it can only be distributed or concentrated at special points where unobjectionable. Work constructed in warm weather is almost certain to show temperature-shrinkage cracks in the winter. Work done in cold weather is much less likely to develop cracks, but there are obvious difficulties attendant upon doing winter work satisfactorily and economically. The less cement used the less the shrinkage. The larger the aggregate the less the shrinkage. A small percentage of steel, properly located, will distribute the cracking so that it is practically invisible. The use of blocks of concrete or other material locates the cracks in the joints unless exceptionally rich mortar is used. This usually effectively conceals the cracks, which really exist, however. Where use is made of curtain-walls between main structural members, the walls can be joined to main members by

slots in the latter, the full width of walls. Expansion and contraction will then produce movements only within these slots and cracking will be effectively concealed. Cornices, belt-courses, &c., by the use of reinforcement can be prevented from showing anything except minute cracks, but it is much better to design such members with breaks, like pilasters, &c., at frequent intervals. The cornices, mouldings, &c., can be carried around these projections, and cracks can be concentrated at the angles where they are not so objectionable. Smooth surfaces are apt to show minute checks or cracks when examined closely, and when they become cracked to any extent from shrinkage or contraction from change of temperature they are very unsightly. Pebble-dash, stucco, or other method of rough decorative treatment, is really the best method of concealing cracking. Close examination will almost invariably show its existence, however. Smooth-plastered mouldings with rough stucco panels have been worked out most satisfactorily in some instances, and show few blemishes even on close examination.

Where walls are to be plastered or stuccoed they should be left as rough as possible. Dry concrete mixtures, the use of very coarse sand, a slight dearth of mortar (not of cement), employment of rough lumber for forms, &c., tend to give such a surface. Surface coatings, like plaster and stucco, should be as thin as possible, where continuous good bond is assured. If bond can be secured only at comparatively rare intervals, a thickness of coating must be applied sufficient to have enough body to be self-supporting between bonding points. Conversely, where it becomes necessary to apply materials more than half an inch in thickness, some special means of securing a good bond should be provided. In every case it is wise to clean thoroughly the old surface by washing and scrubbing, and to roughen it by picking or hammering. Acid treatment is also effective, and there are in existence several secret and patented bonding preparations, consisting of tar and cement products. Even an application of pure cement grout is often not effective unless the surface is first cleaned and thoroughly saturated with water. If greater thicknesses of stucco are required, resort should be made to mechanical bonds. Wire-lath, even when galvanised or painted, is not always of long life, and small-sized wire is of little value in view of the perviousness to air and moisture of the usual plaster and stucco. Quarter-inch should be the smallest size of iron wire ever employed. Use fewer bonds, spaced further apart, if economy in first cost must be rigidly practised. Copper wire is effective but expensive, while vertical, dovetailed bonding grooves or slots can be cast in the mass concrete at small expense. Overhanging cornices, &c., should be most carefully reinforced, because the difference in shrinkage between masses of different thicknesses is likely to crack off the overhanging portion. Although heavy shadows are probably among the best means of securing relief in concretework, still the use of heavy projections and overhanging masses should be avoided as much as possible, unless they take the form of balconies, &c., amply supported on effective brackets or columns, in which proper reinforcement can be provided.

In stucco, of course, mouldings can be run of almost any degree of intricacy and possessing almost any variety of angles and curves. However, if the work is to be cast in mass concrete, great care must be exercised to secure only such shapes of mouldings as will allow ready removal of forms without breaking the edges of the mouldings. Furthermore, even when quite fluid, concrete cannot be worked into such mouldings with any degree of certainty as to result, unless the edges are rounded, bevelled or chamfered, and all surfaces given proper slopes to allow of natural removal of pocketed air and water. Aside from the liability of cracking, there exists another drawback to undertaking long lines or large surfaces in mass concrete, in the extreme difficulty and larger cost involved in maintaining the forms in perfect alignment. Such extended lines and surfaces should be broken occasionally by slight projections, to hide the wavy appearance almost certain to be found. Projections of an inch or two in thickness by two or three times as much in height, in Greek fret or similar simple design, can be constructed without much expense and may be exceedingly effective as decorative features, as well as aid in hiding blemishes of alignment. Such work in intaglio is even less expensive than when in relief, but fails in possessing any curative property.

Simple ornamental work, like the Greek-fret intaglio spoken of above, simple flutings, &c., can be executed in mass concrete with wooden moulds, but their cost soon reaches

undue proportions when more intricate detail is attempted and other methods must be followed. By the use of pressed-metal moulds very complicated work can be accomplished in mass work, but such work is better cast in a shop and set in the work at the proper point, or after the mass work is complete and the forms removed, if proper recesses have been left for its reception. When it is intended that the moulded work shall be set as the work progresses, so that the plastic concrete is poured around the moulded blocks, the latter should be of as large size as possible, especially with regard to the bed. When they are to be set in slots left in the work, manifestly the moulded pieces should be as thin as possible. In either case some reinforcement is necessary—considerably more in the latter case than in the former. Depressions or continuous holes should be moulded into the large blocks so that good bond can be secured to the mass work, and metal bonding-clips must be used in the second case, with proper arrangements provided for their permanent hold in the wall and for their proper attachment to the moulded blocks. As mentioned above, these blocks should be of ample dimensions so that the corrosion which is likely to occur will not soon eat them completely through. In the same manner in which moulded concrete is set in or attached to mass concretework, terra-cotta or moulded brick may be employed. With these materials a form may or may not be adopted. If the design contemplates a continuous brick veneer, the brickwork can be placed first and so constructed and tied together as itself to take the place of wooden forms for wall columns and beams. If the veneer is not continuous a form must be employed. Even then the brickwork may be erected in sections, scaffold-high, before concrete is placed; but care must then be exercised in pouring the concrete not to disturb the brick. By the use of small wedges to maintain proper thickness of joints, an excellent bond can be secured between brick and concrete, but the joints must almost always be pointed and the brickwork carefully cleaned. Tilework of almost any degree of decorative effect can be employed in a similar way. The pieces can be tacked to the forms with copper nails, or a patented process may be employed in which perforated forms are used and the tile glued directly to them with common bill-poster's paste. When it becomes time to remove the forms, the work needs only to be thoroughly saturated with water so to soften the paste that the forms can be removed with ease. Tile will give any colour effects desired. Copper, bronze, painted cast-iron, &c., can be employed for panels where applicable. Massive colour effects can be secured, if care is exercised, by introducing colouring matter among the mass concrete ingredients. Such work, however, is subject to the same variations in uniformity of appearance as is uncoloured concrete. Probably the best method of securing uniformity and extent of colour is the use of coloured stucco, or, perhaps, the application of water-colours directly to the finished surface might serve. In these matters Europeans have had much more experience than we have.

Tooling, etching with acid and washing the surface with water while the concrete is still fresh are three other methods resorted to when it is desired that the mass concrete itself shall be left without superficial applications which may possibly crack off. These three methods are superior to all others, except possibly the use of tile or brick, or of rough stucco, in concealing the small cracking which is so likely to occur. When surfaces are to be tooled, it is necessary that broken stone be used in the aggregate, as gravel does not take the action of a tool with good results. By employing broken stone of various kinds and colours, together with different colours of sand and a white or grey cement, wide variations in surface effects can be secured. The usual reason for tooling is an endeavour to imitate stonework. The results obtained are apt to be poor imitations, except under conditions which make real cut stone little more costly. When the surface is to be etched uniformity of mixture is important, and gravel gives excellent results as well as almost all of the different combinations of aggregate suggested above. The etching process can be carried to any desired depth, but the best results appear when the action removes only the skin-like layer of cement mortar next the forms. Almost identical results can be attained with a scrubbing-brush and plenty of water, if the forms can be removed at an early enough date. With this end in view special designs have been worked out for the forms. When small dimension, uniform gravel is used effects almost identical with pebble-dash stucco can be secured. Obviously such treatment obliterates sharp edges and is inapplicable to cornices,

corners, mouldings, &c., where sharp lines are desired. If such details receive treatment the result is somewhat like an old, weathered, time-worn structure. While the last-mentioned methods of treatment are usually less costly per square foot of finished surface than stucco, still the results are not usually as satisfactory, and in the eyes of many people the extra cost for that class of work is almost always well repaid in added beauty.

There are certain details of design which can be omitted in concrete, which are imperative with other materials. A window or door opening needs a timber lintel or a brick or stone arch to span it. In concrete neither device is necessary, as the wall is a monolith with steel embedded to prevent shrinkage cracks at the corners of the opening. In this particular instance, besides serving no practical purpose, the cost of moulding lintels or arches is really a considerable item of expense in the construction of a building with many openings. Imitation quoin-stones are also costly details, and there is small excuse for imitation stone joints, except to hide variations of workmanship between different days' work. These are obvious examples, but many other smaller ones exist which can be eliminated with good æsthetic and economic effect.

#### *As to Floors.*

In general, almost any arrangement of columns, beams, girders and floors can be constructed in concrete. Intricate, irregular arrangements are, however, considerably more expensive in concrete than in almost any other material.

Three types of floor construction have been evolved thus far. They may be described as (a) long-span slabs between girders, (b) short-span slabs between beams which, in turn, are carried by the same girders, (c) large, approximately square panels supported on all four sides by beams, and having the slab reinforcement running in two directions at right angles to each other, while in the first two types the slabs have their principal reinforcement run in but one direction. The second type merges into the first in some systems in which the beams are placed so close together that the space between can profitably be filled, flush with the beam bottom, with hollow terra-cotta or concrete blocks. The third type is usually less expensive than either of the other two, except with short spans or light loads. Under such circumstances, even the beams may be omitted, and the construction consist of nothing but columns and a continuous slab. The third type gives most stiffness in all directions against wind and other lateral forces, while the last-mentioned variety, as also type (a), are lacking in stiffness in at least one direction. This very lack may have been the cause of several concrete-building failures. It would seem, therefore, that where an ideal arrangement can be made, the most economical and most stable structure would result from placing columns at the corners of squares, connecting them by beams forming the sides of the squares and spanning the whole with slabs reinforced in two directions. Almost any house plan can be so altered as to allow of such a structural design, and partitions can be adjusted to fall under beams and intersect at columns. Both beams and columns can then be entirely hidden in the partitions, while considerable total building height can be saved when compared with other materials, because of the thin floor-slabs employed without false ceilings and the attendant loss in air-spaces. Of course, it is not necessary to maintain exactly identical dimensions in all panels of a row, or between the widths of different rows; but as little variation as possible should be allowed from the square shape, since the economy inherent in that shape is soon lost when differences of span are introduced. On the other hand, combinations can be made, such as of two rows of square panels with a short-span single slab over a hall between the rows, &c. One panel at almost any point can be devoted to a stair-well, or the stairs may be placed in a special panel of different dimensions outside the regular series. When floor plans are laid out with these points in mind, much money can be saved.

Obviously, the same points that were noted regarding the finish of concrete walls are pertinent with regard to the finish of concrete ceilings. The ideal of decoration would seem to be to give a pleasing appearance to each member or portion of a structure, and in such a way as, at the same time, to disclose its real use and composition. If this ideal is sound, the employment of such details as imitation beams formed in plaster under large span concrete slabs is not good architecture. Such designs are reversions to the old wooden period. Similarly, the usual roof projections can best be made in concrete as simple

cantilever slabs, while almost invariably false roof beams are applied for so-called æsthetic reasons.

Concrete floors finished with a cement wearing surface are so much less resilient than wooden floors that many people demand wooden top floors even with concrete slabs. If a floor is to be finished with a cement dressing, many of the same points apply to the securing of a good bond between the main floor and the top finish as have been noted with regard to the stuccoing of walls. Unless the finish coat is installed at practically the same time as the under floor, a thickness of nothing less than  $1\frac{1}{2}$  inches should be allowed. Many advocate  $2\frac{1}{2}$  inches. In every instance great care should be exercised in cleaning and saturating the surface of the old work before the new is applied. One of the good points about a cement top on any floor is that the cement finish can be carried continuously from the floor up the sides of walls and partitions to form a base which is almost perfect in its sanitary properties. Several patent floor coverings are on the market, which take the place of the hard, heat-absorbent cement dressing above described. They are usually much more costly, however, but are often an improvement in some point or another.

These are but a few of the many points involved in the use of reinforced concrete, and others will occur almost daily to anyone who is studying the evolution of this old-new building material.

### ELEMENTARY SCHOOLS.

THE Board of Education have issued a new series of regulations for the planning and fitting up of public elementary schools. For large departments containing from 350 to 600 places, it is said the most suitable plan is that of a central hall with the classrooms grouped round it. As a rule such a department would require from seven to ten classrooms. Smaller departments may be planned conveniently with the classrooms opening from a corridor, and a similar plan may be adopted even for larger departments. For small schools a schoolroom with one or more classrooms will be sufficient. There should always be at least one classroom, except in special cases.

Where the site is sufficiently large, open and fairly level, the most economical plan is that in which all the rooms are on the ground floor, and this arrangement is preferable on educational grounds. It is desirable that a building for use as a public elementary school should be on not more than two floors. A building on three floors is open to many objections, though it may be necessary in special circumstances, as, for example, on a site where land is very costly, or where it is otherwise impossible to get adequate area for playgrounds.

When there is a central hall it should have a floor-space of not more than 4 square feet for each scholar for whom the school is recognised; about  $3\frac{1}{2}$  square feet for each scholar will be sufficient. The hall must be fully lighted, warmed and ventilated. (a) A single central hall may be provided for the joint use at separate times of two departments, provided that it is so placed as to be readily accessible from the classrooms of each department. (b) Where outdoor space is not available, physical training should be given in the central hall (or corridor). This purpose should be taken into consideration at the time when the building is planned. Since fixed gymnastic apparatus is unsuitable for children under fourteen years of age, a separate gymnasium is not required and cannot be approved.

Large schools not built with a central hall must be provided with a wide corridor giving access to the rooms; and two or three of the rooms ought to be divided from one another by movable partitions only, so that on occasions one large room may be available. A corridor should be fully and directly lighted and ventilated, and from 8 to 12 feet wide, according to the size of the school.

Where a schoolroom is the principal room in a school which has neither central hall nor corridor it should never be designed for more than 100 children, and a room of even smaller size is desirable. The width should vary according to the kind and arrangement of the desks. No schoolroom lighted from one side only can be approved. The gable ends should be fully utilised for windows, and there should be no superfluous windows opposite the teacher. When a school consists of a single room, that room should not contain more than 600 square feet of floor-space.

The number of classrooms should be sufficient for the size and circumstances of the school. (a) The class-

rooms should not be passage-rooms from one part of the building to another, nor from the schoolrooms to the playground or yard. Both schoolrooms and classrooms must have independent entrances. The rooms should be arranged so that each can be easily cleared without disturbing the work proceeding in any other room. (b) A classroom should not be planned to accommodate more than from fifty to sixty children, but in special cases somewhat larger rooms may be approved. In the absence of supplementary light the measurement from the window-wall in a room 14 feet high should not exceed 24 feet 8 inches. Except in very small schools, classrooms should not be planned for less than twenty-four scholars. (c) The proportions of classrooms should vary with the kind and arrangement of the desks; but a long and narrow room should always be avoided, and a room approximating to a square is most satisfactory.

Seats and desks should be provided for all the children, graduated according to their ages, and placed at right angles to the window-wall. The seats should be fitted with backs. An allowance of 18 inches per scholar at each desk and seat will suffice (except in the case of the dual desk), and the length of each group should therefore be some multiple of 18 inches, with gangways of 18 inches between the groups and at the walls. In the case of the dual desk the usual length is 3 feet 4 inches and the gangways 1 foot 4 inches. (a) In an ordinary classroom five rows of long desks or six rows of dual desks are best; but in a schoolroom or room providing for more than sixty children, there should not be more than four rows of long desks or five rows of dual desks. If a schoolroom is 18 feet wide, three rows of long desks or four of dual desks may be used; if the width is 22 feet the rows may be four and five respectively. Long desks should be so arranged that the teacher can pass between the rows. Where dual desks are used this is not necessary, as the gangways give sufficient access, but the teacher should be able to pass behind the back row. (b) The desks should be very slightly inclined. An angle of 15 degs. is sufficient. The objection to the flat desk is that it has a tendency to make the children stoop. A raised ledge in front of a desk interferes with the arm in writing. The edge of the desk when used for writing should be vertically over the edge of the seat. (c) Single desks are not necessary in an ordinary public elementary school.

The accommodation of the school, *i.e.* the number of places for which the school is finally recognised, will depend in part on the arrangement of the desks, which must be approved by the Board. No central hall or corridor, and no classroom for cookery, laundrywork, handicraft, drawing or science, will be counted towards the accommodation. When the building to be erected is for the use of older scholars, the plans of the schoolroom (if any) and classrooms must show an average of not less than 10 square feet of floor-space for each place proposed to be provided. There are special regulations for infants' schools.

All plans, whether for new buildings or for improvements to existing buildings, must be submitted in accordance with the requirements which follow; plans which do not fully comply with these requirements cannot be considered.

1. A block plan of the site drawn in ink to a scale of 20 feet to an inch. This plan must indicate:—(a) The position of the school buildings. (b) Outbuildings. (c) Playground. (d) Drains (collateral and main), with their fall and depth below ground. (e) Entrances. (f) Boundary walls or fences and their nature. (g) Roads. (h) The points of the compass. (i) The levels of the ground at the principal points.

N.B.—For approval of the site alone the plan should show (g), (h) and (i).

2. A plan of each floor of the schoolrooms (and teacher's or caretaker's house, if any) drawn in ink to a scale of 8 feet to an inch. The internal fittings of the rooms (fireplaces, groups of desks, &c.) must be accurately shown. The plan should also state whether the rooms are intended for boys, girls or infants.

In cases of enlargement, a plan showing the buildings as they exist is needed.

3. Sections and at least four elevations, also drawn in ink to a scale of 8 feet to an inch. The ceiling, the positions of window-heads in relation thereto and the mode of ventilation must be shown.

N.B.—(a) Pencil drawings cannot be received, but sketch plans or coloured tracings in ink on tracing cloth may be submitted while plans are in the preliminary stage of pencil, so that suggested alterations can be adopted without difficulty or expense. Such plans may be drawn

to a scale of 16 feet to 1 inch. The Board's final approval will not in any case be given to preliminary plans, and the full plans described above will always be required. (b) Diagrams are of no value and cannot be accepted. (c) In the case of enlargements or alterations the whole site and the existing building should be as accurately shown in every respect as the proposed changes, and in such a manner that any change of numbers can be ascertained. (d) All plans should be dated, the scales drawn on and dimensions figured. (e) It is preferable that all plans should be submitted on linen tracing paper or other material which can be folded.

4. A section of the desk proposed to be used drawn to a scale of  $1\frac{1}{2}$  inches to a foot.

5. A draft specification.

6. An approximate estimate of the total expenditure proposed.

#### DISTRICT SURVEYORS.

THE Building Act committee of the London County Council have prepared the following report:—

We have considered as to the arrangements that should be made for filling the vacant posts of district surveyors in the districts of (i.) St. James, Westminster; (ii.) Paddington; (iii.) Mile End and Limehouse; (iv.) Hammersmith; (v.) St. George, Hanover Square (Belgrave and Pimlico division); (vi.) Charlton, Kidbrooke and Lee; (vii.) City of London, East; (viii.) Holborn; (ix.) Strand; (x.) Lewisham, West; (xi.) Lewisham, East; and (xii.) City of London, West. The gross amounts of the fees received during the year 1906 in respect of the districts (i.) to (vi.) were 2,326*l.*, 1,794*l.*, 1,115*l.*, 1,085*l.*, 1,047*l.* and 639*l.* respectively. The estimated yearly values of the districts (vii.) to (xii.) are 850*l.*, 820*l.*, 820*l.*, 730*l.*, 600*l.* and 500*l.* respectively. In response to the advertisement issued seventy-five applications were received, but in twenty-three cases the applicants did not possess the certificate of competency required by section 140 of the London Building Act, 1894, and three, who were not already district surveyors, were disqualified by age. One of the qualified candidates withdrew his application and another was abroad. The remaining forty-seven candidates were all seen by a sub-committee and their qualifications carefully examined. Standing order No. B 86 requires us to submit the names of three candidates for each appointment, but allows us to indicate the candidate whom we recommend the Council to appoint. The names of those whom we consider suitable are set out hereunder, the first named in each case being in our opinion the most suitable for appointment to the district in question:—

(i.) St. James, Westminster—L. R. Ford, F. W. Hamilton, H. N. Kerr. (ii.) Paddington—F. W. Hamilton, H. N. Kerr, S. F. Monier-Williams. (iii.) Mile End and Limehouse—H. N. Kerr, R. E. Smith, O. C. Hills. (iv.) Hammersmith—A. H. W. Glasson, H. A. Legge, W. G. Perkins. (v.) St. George, Hanover Square (Belgrave and Pimlico division)—S. F. Monier-Williams, A. H. W. Glasson, W. G. Perkins. (vi.) Charlton, Kidbrooke and Lee—A. A. Fillary, P. J. Black, C. B. Young. (vii.) City of London, East—J. Todd, O. C. Hills, H. A. Legge. (viii.) Holborn—W. G. Perkins, A. A. Fillary, H. A. Legge. (ix.) Strand—O. C. Hills, R. E. Smith, A. A. Fillary. (x.) Lewisham, West—W. R. Davidge, A. P. Stokes, C. W. Surrey. (xi.) Lewisham, East—E. W. Lees, C. W. Surrey, W. R. Davidge. (xii.) City of London, West—C. W. Surrey, C. A. Daubney, W. H. Stevens.

Mr. F. W. Hamilton (fifty-six) and Mr. S. F. Monier-Williams (fifty-one), who are both over the age of fifty years, have been district surveyors since 1898, and we are of opinion that their work in their respective districts has been such as to justify their promotion to more remunerative districts. In these circumstances we do not think it necessary to suspend paragraph No. B 17 of our order of reference, which requires that candidates shall not be less than twenty-eight or more than fifty years of age.

The adoption by the Council of our recommendations in respect of the above-mentioned districts will render vacant the districts at present supervised by Messrs. Ford, Hamilton, Perkins, Monier-Williams, Hills and Glasson, viz.:—(xiii.) Wandsworth, West; (xiv.) Fulham, North; (xv.) Hackney, West; (xvi.) Sydenham; (xvii.) Hackney, North-East; and (xviii.) Norwood, West. The gross amounts of the fees received during the year 1906 from these districts were—(xiii.) 1,494*l.*; (xiv.) 795*l.*; (xv.) 806*l.*; (xvi.) 722*l.*; (xvii.) 502*l.*, and (xviii.) 466*l.* respectively. Having regard to the varied characters and values

of the twelve districts which were advertised, and to the fact that applications were received from almost all of those known to be qualified for the position of district surveyor, we do not think that it is necessary to advertise the vacancies caused by the promotion of existing district surveyors, and we therefore submit the following names of candidates suitable for appointment to the districts thus vacated:—

(xiii.) Wandsworth, West—R. E. Smith, A. H. W. Glasson, J. Todd. (xiv.) Hackney, West—H. A. Legge, E. W. Lees, C. A. Daubney. (xvi.) Sydenham—G. Tolley, A. P. Stokes, P. J. Black.

We do not propose at the present stage to submit recommendations for permanently filling the vacancies in (xiv.) Fulham, North; (xvii.) Hackney, North-East; or (xviii.) Norwood, West, or in Streatham, West, which is also vacant, as we have under consideration the question of the readjustment of the boundaries of some of these districts. We have, however, made temporary arrangements with Messrs. A. P. Stokes, H. A. Legge, A. G. Morrice and W. H. Stevens respectively for the supervision of these districts in the event of our recommendations being adopted by the Council.

Each of the selected candidates has signed a declaration that he will accept appointment on the terms laid down in paragraph No. B 18 of our order of reference, and Messrs. Ford, Hamilton, Perkins, Monier-Williams, Hills and Glasson have expressed their willingness to resign their present appointments in the event of the Council appointing them to the districts suggested above. Mr. R. E. Smith, however, asks that he may be allowed to retain his position of Professor of Architecture and Building Construction at King's College until 1910, in order that he may be entitled to retain after retirement from the chair the honorary rank of "Emeritus Professor." We are informed that the time taken up by this appointment is small and will not interfere with the performance of his duties as district surveyor, and we think that permission may be granted. We recommend—

(a) That Mr. Lawton Robert Ford be appointed district surveyor for the district of St. James, Westminster, as from and including September 1, 1907. (b) That Mr. Frederick William Hamilton be appointed district surveyor for the district of Paddington. (c) That Mr. Henry Nathaniel Kerr be appointed district surveyor for the district of Mile End and Limehouse. (d) That Mr. Arthur Henry Wharton Glasson be appointed district surveyor for the district of Hammersmith. (e) That Mr. Stanley Faithfull Monier-Williams be appointed district surveyor for the district of St. George, Hanover Square (Belgrave and Pimlico division). (f) That Mr. Albert Anthony Fillary be appointed district surveyor for the district of Charlton, Kidbrooke and Lee. (g) That Mr. John Todd be appointed district surveyor for the district of City of London, East. (h) That Mr. William George Perkins be appointed district surveyor for the district of Holborn. (i) That Mr. Osborn Cluse Hills be appointed district surveyor for the district of Strand. (j) That Mr. William Robert Davidge be appointed district surveyor for the district of Lewisham, West. (k) That Mr. Ernest William Lees be appointed district surveyor for the district of Lewisham, East. (l) That Mr. Christopher William Surrey be appointed district surveyor for the district of City of London, West. (m) That Mr. Herbert Alfred Legge be appointed district surveyor for the district of Hackney, West. (n) That Mr. George Tolley be appointed district surveyor for the district of Sydenham. (o) That Mr. Ravenscroft Elsey Smith be appointed district surveyor for the district of Wandsworth, West; that he be allowed to continue during the pleasure of the Council, or until March 31, 1910, whichever shall be the shorter time, to occupy the chair of Architecture and Building Construction at King's College, London.

#### THE RESTALRIG CHAPTER-HOUSE.

TRAVELLERS on the North British Railway in passing Piershill station may have noticed on the south side of the interesting old church of Restalrig—a mile or more from the Edinburgh post office—a grass-grown mound with a flattened conical roof reaching almost up to the wall-head of the edifice itself. It cannot be seen over the grimy wall which encloses the church and churchyard on the Clockmill Lane side; neither can it be observed on the north side, which is blocked by a number of mean sheds and byres, which almost touch the walls of the church itself. As the churchyard gate is kept locked, except on Sundays, the

mound in question can only be seen during the week from the railway or the footpath on the north of the railway works. This mound is the chapter-house of Restalrig Church, which it was stated at the meeting of the Edinburgh Presbytery the Earl of Moray, the superior of the village, has generously intimated his intention of restoring to its original condition. Like the greater part of the church, says the *Scotsman*, the chapter-house is said to date from about the beginning of the fifteenth or the end of the fourteenth century, though there are evidences in a doorway of an earlier church, possibly of the twelfth century. It is a six-sided building, with a diameter of about 29 feet, having in the interior a central pillar with carved capital and a beautifully groined roof, with ribbed and carved bosses at the intersections, and at the angles responds with carved capitals. The chapter-house was lighted by three windows, looking towards the south, south-east and south-west. They were each divided into three lights. One of them had been knocked out and made into a door, the others had been filled up with masonry. It will be part of the work shortly to be engaged in to restore these to their original state. The windows, perhaps, are unique in Scotland. They compose what is known as a four-centred Gothic arch, and are about 5 feet 6 inches in width and about 7 feet in height; width and height, including the three lights. No original doorway has been discovered, but as it is evident that the chapter-house would be connected with the church, the clearing-out operations will no doubt bring one to light. The chapter-house is separated from the church by a passage of about 3 feet. On the church side there is a wide space, which has evidently been built up with later masonry, and possibly there traces of the original door may be found.

The chapter-house at present, it may be said, is filled up to within 2 feet of the top of the pillar with earth, and it seems that subsequent to the Reformation period it had been used for purposes of burial. The earth will all be cleared away and the original flooring laid bare. Mr. Thomas Ross, architect, into whose skilled hands the work of restoration has been put, reports that the dainty carved top of the pillar and the elegant groined roof of the chapter-house are in an excellent state of preservation, notwithstanding the mouldy moisture to which they have been subjected for so many years, and that all that will be necessary for their restoration will be to clean them and do some pointing. The walls will also require similar treatment. The turf and earth with which the roof on the outside is covered will be removed, and possibly, after it is seen what is underneath, an appropriate high-pitched roof substituted. It is suggested that the earth had been placed on the top of the roof of the chapter-house, at some period in its history, for protective purposes. The invading armies from England, on their march against the capital, had to pass Restalrig; the village was the scene of many skirmishes between the forces of the Queen Regent and the Lords of the Congregation, and others of later date, and possibly the fine roof of the chapter-house was protected in this way to secure it against gun or cannon shot. A similar thing had been done at Craigmillar with one of its exposed towers. It had been covered to a considerable depth with earth, and something of the same kind existed also at Elphinstone Castle. It is an interesting architectural fact that St. Margaret's Well (now placed in the King's Park), which at one time stood in Restalrig village, is on a plan similar to the chapter-house, though on a somewhat smaller scale. It is singular that two such buildings with features almost unknown elsewhere in Scotland should have been erected in this outlier of the capital. St. Margaret's Well, it may be recalled, stood where the N.B.R. sheds are now erected. It ultimately came into the possession of the Board of Works, who removed it to its present site.

The ancient village of Restalrig is full of social, political and ecclesiastical traditions, as may be seen by the readers of any of the old histories of Edinburgh. There are records of it in the thirteenth century, and the estate was for long in the hands of the powerful family of the Logans of Restalrig, whose stronghold was situated on the rocks overlooking Lochend. It subsequently passed (by forfeiture) to the Elphinstones of Balmerino, and (also by forfeiture) after 1746 it was transferred to Lord Bute. It is now the property of the Earl of Moray.

Arnot, in his "History of Edinburgh," speaks of the church of Restalrig as a ruin with nothing remaining of its former glory but the east choir window, and so it remained until 1837—or some date about that time—when it was reroofed and made into a chapel of ease for the neighbouring

parish of South Leith. Regarding the building now called the "chapter-house" of the church, which is about to be restored, Arnot speaks of it as having originally been the family vault of the Logans of Restalrig, and in his day he describes some old yew trees as growing on its top. Wilson calls it an "ancient mausoleum," and says it is believed to have been erected by Sir Robert Logan of Restalrig in the earlier part of the sixteenth century, and to have "evidently been constructed on the model of St. Margaret's Well," which, at the time he wrote (1847), still stood in the neighbourhood; and both historians, as well as Grant, give a few names of titled people who were buried in it in the sixteenth century. Grant as an alternative to the mausoleum theory also calls it the chapter-house of the church. Wilson, following Arnot, speaks of the building as being "still more beautifully adorned externally" than it was internally, with fine venerable yews that have taken root in the soil accumulated on its roof. The forthcoming restoration of the building will, no doubt, throw light on some of these moot points.

#### WIGMORE ABBEY.

A PAPER was read last week before the Royal Archaeological Society of Great Britain and Ireland by Mr. W. H. St. John Hope on his excavations at Wigmore Abbey, Herefordshire. The abbey, he explained, had stood about eight miles west of Ludlow, and about a mile and a half from the famous ruins of Wigmore Castle. The castle was built for William the Conqueror between 1066 and 1072 by W. FitzOsborne, and its custodian was the first of the Mortimers, subsequently Earls of March. The first monks established near the castle belonged to the Order of St. Victor of Paris, and their church served for the parish as well as the canons. The founder, however, quitted the service of his lord, who seized his possessions, but eventually the site of the abbey was granted to the monks by Hugh Mortimer, who laid the foundation-stone of the church, other stones being laid by John Brian and his father, who both did much for the abbey. That was in 1179, and two years later the Bishop of Hereford hallowed the church, the founder of which was buried in 1185 in front of the high altar. Some years later the Welsh attacked the abbey and burned it, while the fourth Mortimer was a prisoner of the King of France. The Earl of March in 1379 rebuilt the abbey, which benefited largely under his will, and in which he was buried, as were nearly all the Mortimer family. At the time of Henry VIII. the abbey was worth 302*l.* a year, and it was surrendered to the king. Most of the buildings were pulled down, the materials being used to repair neighbouring castles. There still remained the gatehouse, the cellar and the hall above it, now used as a farmhouse. Parts of the wall of one transept and of the aisleless nave also stood, but elsewhere even the foundations had been practically removed. The excavations had enabled the plan of the buildings to be reconstituted in great part, though no trace of the chapter-house had been found. The aisleless nave was 120 feet long by 28 feet wide, and contained seven bays; there were six bays in the presbytery and at least two in the lady-chapel. The whole church was 300 feet long. Mr. Hope showed a few Mediæval tiles found in the course of the excavations, which he said were remarkably bad, and seemed to indicate that the monks were very poor when they laid them down.

#### CAERWENT EXPLORATION.

AT the annual meeting of the subscribers to the Caerwent Exploration Fund Mr. A. Trice Martin (hon. secretary and treasurer) gave particulars of last year's work, in addition to the facts contained in the following appeal:—The report of last year's work at Caerwent was presented to the Society of Antiquaries on May 30. The work, which as usual was carried out under the supervision of Mr. Ashby and Mr. Hudd, included further exploration of the mound and the excavation of a large house of the courtyard type in the orchard to the south of the amphitheatre. In this house, as usual, there were numerous indications of rebuilding, and an attempt has been made to disentangle the plans of houses of at least three different dates which have stood upon this site. There were no less than three hypocausts, one of which showed some interesting details as regards the wall flues. The finds were interesting, and included objects of greater artistic merit than usual. One large jar which had been carefully covered by a mortarium contained a series of almost perfect pots, and in one of these a

few remains were found. This house is still open and will only be covered up as the work progresses to the south and east of it. The work that we have in hand this season promises to be exceptionally interesting, and if funds will permit it is hoped that the work will be carried on for a much longer period than last year. It has indeed already begun, and has brought to light what Commendatore Boni, who has just visited the city, considers to be the massive foundations of an important public building, the first that has been discovered in Caerwent. The investigation of the remarkable drain discovered two years ago is also proceeding, and this season's work will, it is hoped, include not only the completion of these excavations, but also the exploration of the rest of the orchard in which the interesting house of last year was situated. The walls of a house to the south have already been discovered. Subscriptions are again urgently needed, and we shall be most grateful not only for your help but for the help of any others whom you may be able to interest in our important undertaking. Subscriptions may be sent as usual to the treasurer or any member of the committee.

The statement of accounts, which was passed, showed that the subscriptions amounted to close upon 300*l.*, of which no less than 125*l.* was subscribed by Viscount Tredegar. The amount expended in wages was 280*l.*

Mr. A. E. Hudd described the work which had been carried on under his supervision during the month of June, and a visit was afterwards paid to the building referred to in the appeal. The walls were found to be very massive, and one feature which was noticed was the insertion of several courses of brick or tilework above the lower courses of heavy stone. The drain had been further opened out, and it was easy to comprehend the massive size of the structure from the covering stones, which each weighed considerably over a ton.

#### Trade Catalogues for the Cape.

SIR,—Will you allow me through your columns to warn British manufacturers of building materials who are in the habit of sending their catalogues to the Cape that there is at the present time a heavy import duty in force on certain printed matter, in which trade catalogues are included, with the result that hundreds of catalogues are being refused owing to the heavy surcharge levied upon the recipient. Only last week the writer was charged 3*s.* upon a single catalogue sent from England.

My object in writing is not to question the fairness of the tax, but to warn manufacturers that whilst this regulation remains in force sending catalogues to this country may be largely a waste of time and money.

FRANCIS MASEY,  
President of the Cape Institute of Architects.

#### "The Architect's" Illustrations.

SIR,—I should like to congratulate you on last week's issue of *The Architect*. The illustrations were very fine indeed, and I would suggest that the issue is what might be termed a fine commercial number. I was with an American architect in a hotel in the North of England, and he was much impressed by the three fine examples of London, Liverpool and Manchester architecture.—Yours faithfully,

H. J. K.

#### GENERAL.

The Council of the Institution of Civil Engineers have appointed Sir William Matthews, K.C.M.G., president of that Institution, to succeed the late Sir Benjamin Baker, K.C.B., K.C.M.G., as one of their representatives on the main committee of the Engineering Standards Committee.

The Receipts of the closing day for admission to the two rival Salon exhibitions in Paris were handed over to the Society of Friends of the Louvre.

Lady Waterlow has offered to present to the London County Council some marble statuary for the park presented by her husband in 1889.

Mr. John Romilly Allen, F.S.A., editor of the "Reliquary" and of the "Archæologia Cambrensis," died on Friday at his residence in Great Ormond Street, at the age of sixty.

Mme. Garnier, the widow of the architect of the Paris Opera House, has presented to the Military Museum a landscape in water-colours by Marshal Pelissier, who was a clever artist and a friend of her husband.

M. Georges Tersling has obtained one of the gold medals in the competition of façades as architect of a mansion in the Rue de la Faisanderie, Paris.

At a Sale in London on Friday last Sir J. Reynolds's portrait of Master Bunbury, painted in 1780, was sold for 5,600 guineas, J. Hoppner's portrait of Mrs. Manning and her daughter 4,000 guineas, and the same artist's portrait of Susanna, in blue dress and large hat, a similar amount.

The Paris Municipal Council has purchased the "Birth of Venus," by M. Henri Gervex, which is to be hung in the Petit Palais. This year's purchases from the Salons has amounted to 30,600 francs.

The Playing Cardmakers' Company recently offered prizes for the best designs for playing cards, the subject being Imperial unity. The first prize has been awarded to Mr. Harold W. Hardy, Featherstone Buildings, Holborn, and the "H. D. Phillips" prize to Mr. Hector Munro, Grantham Road, Sparkbrook, Birmingham.

Mr. John Mitchell, architect of the Auckland (New Zealand) Education Board, is now visiting the United States to investigate the applicability of reinforced concrete for important public buildings.

A Stained-glass Window as a memorial of Robert Browning has been placed in the Anglican church of St. George at Venice. A committee has recently been formed to provide a similar window as a memorial of John Ruskin.

The Aston Town Council have presented Mr. G. H. Jack, borough surveyor, with an address and a cheque for over 100*l.* as a testimonial in view of his relinquishing his duties to act as Hereford county surveyor. Mrs. Jack was presented with a gold bracelet. Mr. Jack was appointed assistant borough surveyor ten years ago.

Mr. Leonard Maggs, the chief assistant in the architectural department of the Hertfordshire County Council, has been appointed architect to the Nottinghamshire education committee, on the same terms and conditions as Mr. Sander was appointed in 1905.

An Illustrated Descriptive Sketch of the church of Saint White, or Candida and Holy Cross, near Lyme Regis, has been issued by the Rev. D. Holland Stubbs, and should be of great value to visitors. The history of the church goes back to Alfred the Great's reign and its structure to 1180.

At the Last Meeting of the Selby Abbey Restoration Fund executive committee Mr. J. Oldrid Scott, architect, submitted drawings and plans of the new reredos, altar, altar rails, choir stalls, pulpit, Bishop's chair and litany desk, all of which had been presented to Sir E. J. Poynter, P.R.A., who has been consulted and has approved of them. The plans were accepted by the committee. The wood carving for the choir is to be done by Mr. Bridgman, of Lichfield, and the figures in the panels of the reredos are to be executed by Peter Rendel, of Ober-Ammergau, on the recommendation of Sir Edward Poynter, P.R.A.

At Crowland a movement has been inaugurated for placing in the historic abbey a memorial of the late rector, the Rev. T. H. Le Boeuf, to record his work, zeal and love in connection with the restoration of the abbey. A stained-glass window has been suggested as a fitting memorial.

An Exhibition of the work of the Architectural Association School will be opened at the Museum on Friday next, the 19th inst.

The General Purposes Committee of the Westminster City Council, reporting on the letter of Mr. J. Hare touching the proposal to erect a statue on a suitable site to the memory of Sir Henry Irving, states that it has come to the conclusion that the best position for the statue would be on the broad pavement in Charing Cross Road, at the rear of the National Portrait Gallery.

The Earl of Plymouth presided at a meeting on Tuesday to consider the subject of the Whistler Memorial. It is to cost 2,000*l.*, and the subscriptions amount to 1,600*l.* M. Rodin will execute a symbolical figure, which is to be placed at the end of the garden near Chelsea Church.

The Joint Committee of the London Corporation have reported against the endeavour to preserve Crosby Hall on account of the large outlay which would be required.

## THE WEEK.

THE late Mr. HARRY QUILTER, who died last week, would probably have ranked much higher in the public esteem if he had only lived as an amateur. He could appreciate art, and he possessed sufficient means to enable him to purchase specimens. But he was not satisfied with the mere enjoyment of his own theories. He wished to show that he could draw and paint, and was entitled to be considered as a lawgiver on all problems of æsthetics. He was in consequence judged by a severe standard, and as neither his drawings nor his pictures were remarkable efforts for a man who had studied painting in the Slade School and in Belgium, his practice did not confirm the value of his principles. But he was outspoken, and always wished to express his own experience. In consequence his encyclopædic "What's What?" becomes pleasant reading, although the reader may not be convinced of the writer's omniscience. He claims the authorship of a third of the contents, amounting to 350,000 words. In several of his peculiarities it must be owned he was a typical Englishman, and if he had lived longer he was not unlikely to have done greater justice to himself.

THERE are so many architects available owing to the inducements which have been held out to ambitious youths, we need not be surprised that Poor Law Guardians consider they should have an architect as a permanent officer. At last week's meeting of the Kingston-on-Thames Guardians it was proposed to appoint an architect on the permanent staff of the Board at a fixed salary. It was found that during the last ten years the average amount paid in fees was 770*l.* per annum. It was therefore proposed to pay an inclusive sum of 400*l.*, which was to include the rent of an office and the salary of a draughtsman. The architect who had received the money, it was said, was also paid compensation for his loss of office as surveyor to the rural sanitary authority. In opposition it was said there was no need to pay so large a salary, for at the present time their architect acted as a quantity surveyor, receiving only 1 per cent. for the work. In the end the motion was rejected, the general opinion being that it came too late. The discussion, however, suggests the belief which is spreading among public bodies that architectural work can be obtained at almost nominal rates.

THE influence of the COLLS case was seen in the Court of Appeal when the case of STAMP & WIFE v. BYWATERS & SONS, LTD., came before their lordships. The plaintiffs are proprietors of an hotel which is on the upper floors of a house in Bond Street. The shop was let to another firm. It was necessary to make alterations. The builders' workmen commenced work at 3.30 A.M. and the noise caused inconvenience to the various occupants of the hotel. An action was taken and the plaintiffs were awarded seven guineas damages. The builders appealed. The Master of the Rolls said that in such a city as London and in such a street as Bond Street there must be the risk incurred of noise whenever building operations were carried on. In the Court below the judge considered the degree of noise as not unreasonable. But he thought that the works should have been commenced at a later hour than half-past six. As the trade unions and the master builders of London had decided on half-past six the defendants could not be considered as entirely responsible for fixing the hour. There was no evidence of actionable nuisance. The other judges concurred and the appeal was therefore allowed. It is to be hoped that henceforth the public will recognise the conditions under which the building trade is carried on. At the present time many builders believe they are incurring a risk

when their men begin to work at the fixed hour. On the other hand, the exigencies of trade, and it may be said also the wish of ordinary people who walk in the streets, are in favour of expedition, and if possible they would have works conducted by night as well as by day.

AN Italian architect, Signor CASTELUCCI, has, it is said, discovered the basin of the font in which DANTE, the poet, was baptized, and it is believed he will attempt a restoration of the whole. The statement is interesting, because we know that about the middle of the month of May in the year 1265 a child was brought to the Baptistry of St. John the Baptist in Florence, and received the names of DURANTE ALIGHIERI. But the font was connected in another way with the life of the poet. In the nineteenth canto of "The Inferno" he tells us how he saw the figures of SIMON the Magician, and some of his followers. The place of their imprisonment was formed of black stone, and recalled to him the Florentine font. As became a student of AQUINAS, DANTE believed that the laws of nature applied to other parts of the universe besides the earth, and in the reservoir he saw round holes which were about the same size as those in the baptismal basin. He probably wished to suggest that any excess of the liquid fire passed away through them just as the overflow of water in the font. At the time of DANTE'S visit it was not fire that issued from them, but the feet and part of the legs of the unfortunate prisoners, which were seen writhing in agony. DANTE, in a rare moment of pity, wished he could free them as easily as he once did a child in the Baptistry, when by breaking the grille which covered one of the holes the water escaped and he was able to save the drowning infant. His enemies endeavoured to make out that DANTE'S act was inspired by sacrilege, and it was probably believed by many of his fellow-citizens, otherwise he would not be so eager to explain his conduct. It has been supposed by some archæologists that the child was rescued not from the font, but from one of the auxiliary basins which surrounded it and through which the water passed. The task before Signor CASTELUCCI is therefore less easy than it would appear from the description.

IN a recent number of the *American Architectural Review* there is mention of a competition for a new building in Washington which is to be known as the International Bureau of the American Republics. It is another of ANDREW CARNEGIE'S gifts, and is to cost 600,000 dols. complete and including the architect's fees. Ten architects were invited to compete, and each of those accepting the special invitation is to receive the sum of 1,000 dols. to cover the expense of making plans. In addition, a general invitation was extended to all architects in the United States to enter the competition on equal footing with the invited competitors. The competition has therefore some resemblance to that for the London County Council Hall. For the best design the prize is 3,000 dols., the second 2,000 dols., and the third 1,000 dols. The building is to contain four sections, viz. administration, library, assembly and service. The library section will have a large stack-room, public reading-room, map, photograph and periodical rooms, and the usual adjuncts necessary to a library. The assembly section will contain an assembly hall of 6,000 feet of floor-surface, with rooms for governing board and committees. It is recommended that, as the peoples of most of the American Republics are of Spanish, Portuguese or other Latin extraction, it is desirable that the building should have a character in harmony therewith. The endeavour to unite the Republics of the two Americas by a bond of brotherly feeling is a cause in which President ROOSEVELT, Mr. CARNEGIE, Secretary ROOT and others have interested themselves deeply. It is to be hoped the various Republics will make more use of the Bureau than the British colonists make of the Imperial Institute, which is supposed to serve a similar purpose.

## EXAMINATION OF MATERIALS IN BULK.

ON Friday last we published an article on "Compliance with Specifications," in which we attempted to indicate the principles adopted for testing materials in the United States. The system which is sought may be shortly described as entirely scientific, and, as far as possible, it is outside the range of human peculiarities. If carried out perfectly the examples to be tested would be obtained by scientific impartiality, tested by mechanical or chemical processes, the results announced by an indicating apparatus, and the contractor, in case his goods were rejected, would have to accept the loss with the philosophy of a machine. It so happened that on the same day when our article appeared an important action respecting wood-paving was concluded, in which the ways adopted for testing in England were considered. Mr. Justice DARLING, who tried the case, may have wished the American system prevailed among us. Like all other impartial men who are brought face to face with the duties of an architect or an engineer, he must have recognised the extreme difficulty of their position. Disagreeable acts have to be done which inflict loss upon contractors about whose honesty there can be no doubt, but who for the occasion have become victims of circumstances.

The action was taken by the Acme Flooring and Paving Company (1904), Ltd., against the Westminster City Council. The origin of the dispute has been already described. The plaintiffs had entered into a contract to lay down wood-paving in nine of the principal streets of Westminster. Mr. J. W. BRADLEY, the engineer to the City Council of Westminster, rejected blocks to the number of 700,000, although the stacks in which they were placed had been approved by subordinate officials. The plaintiffs declined to go on with the works, and brought their action for breach of contract, claiming 700*l.* for work actually done besides damages arising from the rejection of the blocks. Cases of the kind should be heard by experts, for with all respect for counsel, it must be allowed that their training and methods enable them to make mountains out of molehills with satisfaction to themselves. Quantities which are reckoned by hundreds of thousands are adapted to sustain rhetorical effects; but when it is known that the plaintiffs had supplied 9,000,000 blocks which were approved and used, the number in question is not so alarming.

It was contended on behalf of the plaintiffs that such a sweeping rejection was excessive. The specification appeared to resemble many other documents of the kind. It abounded in adjectives. The timber was to be sound and good, of even grain, well seasoned, sufficiently matured, and free from sap, shakes, waney edges, warps, large, loose, or dead knots, or other defects. The city engineer was to have full power to reject any of the timber which he did not consider as fit to be employed. As usual, he was omnipotent. It should be realised by contractors that if people will bind themselves to excessive if not absurd regulations—and the judging of materials in gross is undoubtedly one—they must accept the consequences. It ought to be remembered that natural substances are only uniform to a tolerably general extent. No pair of leaves on a tree are exactly alike in form, and the differences between a pair of trees are more remarkable. It is difficult to find two railway sleepers of similar dimensions which are exactly alike in weight. It will also be found if the two are subjected to a creosoting process their power of absorbing the material also varies. It does not necessarily follow that slight differences affect the strength of the timber, although appearances may be against some of the specimens. For the purpose of testing the most objectionable pieces are commonly obtained; but the results often demonstrate that with materials as with other things we should not always judge by appearances.

It is not to be expected that a busy engineer can afford the time necessary to examine several millions of wood blocks one by one. A summary method has to be adopted, but although it may serve in ordinary practice yet it will hardly sustain the fierce light of an examination in courts. The exercise of despotic power on such occasions may sometimes appeal to ratepayers who are jurymen, and who believe most contractors are dishonest. But it is always advantageous to be able to demonstrate that examination and testing were of a kind which could be considered as fair to all parties. Dr. DUDLEY, whose address we brought before our readers last week, is careful to recognise the possibility of an erroneous rejection, and in such cases whoever is represented by the testing expert should, he say, make good the loss, regarding it as one of the inevitable expenses of doing business. Dr. DUDLEY supposes something more has been done than a mere hurried visual examination. He calculates on tests in a laboratory or in a machine-room, and we expect he would advise a contractor never to supply materials if they were to be examined only in heaps.

The Westminster City Council prudently sheltered themselves behind the contract deed. It stated that the material and works were to give their engineer satisfaction, and his decision was to be final about compliance with the conditions. It was shown that Mr. BRADLEY had examined the materials and there was no obligation on him that he should endorse the opinion given by his inspectors. But an endeavour was also made to prove that the blocks contained an excessive amount of "sap-wood," although in the specification what was prohibited was "sap." Plain men who have had experience can translate the difference between the two. But when a number of physiologists appear are allowed to express their opinions at length, it becomes difficult to say whether both terms are more alike, or whether there is a vast difference between them. If Mr. BRADLEY had any doubt, as an engineer of experience, about the quality of the timber, he was able to find a great many botanists to confirm his view. But students of that class are rather prone to give more attention to the defects of trees. For a perfect tree like a perfect man, does not afford any opportunities for microscopic investigation. It is also doubtful whether a contractor who has not been warned about such tests as the vegetable physiologists applied should be held responsible for any results derived from them. In the manufacture of steel, photographs of microscopic sections are coming into use, and they are also, to a certain extent, employed in connection with cements. But although they may be taken from timber trees, exact rules about the value of the appearances presented are not forthcoming. Mr. Justice DARLING showed little customary good sense when he expressed regret that a practical trial of the wear and tear during a year was not agreed to by both parties.

It is always risky to suggest that an architect or engineer in dealing with materials allows a prejudice of any kind to obtain control over him. It is not to be expected that any man occupying such a position can ever bring himself to have indifference to results like a testing-machine. Although he was a very cool-headed Scotsman, the late Mr. KIRKCALDY used sometimes to exhibit the enthusiasm seen at golf and curling when refractory material held out longer than he had anticipated. Although an American and schooled to be impassive, Dr. DUDLEY says that on his own account he repeats experiments, exhibiting in that way pity for a contractor or manufacturer. As the Judge said, it was a very grave charge to allege that Mr. BRADLEY in his rejection was merely gratifying a fad. But unless there was collusion and profit to be derived from the transaction it could have no weight with an ordinary jury. The consequences of unfairness on the part of a city or borough engineer are so serious, a man must be very indifferent to his own interests who allows himself to be considered either as a friend or as an enemy.

ny particular contractor. In the days of the Metropolitan Board of Works a charge of the kind was made against Sir J. W. BAZALGETTE. One contractor not only believed in him, but consulted him as special adviser. It was accordingly stated that when the contractor was entrusted with a very important section of the main drainage it was solely through BAZALGETTE'S influence that some of the competitors were passed over, although they considered themselves more entitled to the work. But when the investigation took place it was found that the engineer had advised the Board to employ a different contractor. For even under delicate circumstances BAZALGETTE knew how to uphold his official position.

After a long investigation, which was also a test of Mr. Justice DARLING'S recovery from a serious illness, his Lordship left two questions for the consideration of the jury, viz. (1) whether the blocks delivered or offered for delivery by the plaintiffs under their contract with the defendants were in accordance with the terms of the contract and specification; (2) whether, in deciding that the blocks delivered or offered by the plaintiffs did not comply with the terms of the contract and specification, Mr. BRADLEY acted dishonestly. As might have been expected from the beginning the jury gave a negative reply to the second question. As regards the first, they admitted their inability to decide whether the blocks were in keeping with the specification. Indeed, that was a question which practical engineers only were competent to answer. But they considered the spirit of the contract had been strained in the manner of rejecting the blocks. The judge came to the conclusion that judgment must be given in favour of the defendants. He granted a stay of execution, but suggested that some other course besides an appeal should be adopted by the parties.

Whatever may be the end of the litigation, we consider it to be a protest by a dozen men of business against the rough-and-ready process of determining the quality of materials in bulk. Such cases have a resemblance to the Slaughter of the Innocents which is annually gone through in the Westminster House of Commons. A more deliberate and scientific method is required. If anyone will consider what has to be gone through from the time when pine-trees are cut down in Sweden until they are heaped in Westminster as blocks, it must be allowed that, however honest everybody concerned may be, it is impossible to obtain large cargoes which are free from occasional defects. If a superlative standard for wood is necessary, then the officials of any corporation ordering blocks should be present at all the stages from the cutting down of the tree until it is laid in the street. The forests are under no compulsion to comply with the terms of an exact specification. If it is considered that a large quantity of blocks must be eliminated, then steps should be taken by which there will be no possibility of confounding sound and unsound timber, and also no possibility of injuring the reputation of contractors, which is as important to them and to the public as high character is to an engineer.

### WORKING-CLASS DWELLINGS.

WHENEVER the history of sanitary improvements in this country is compiled it will be found that much was executed before the problem of housing large numbers of people was attempted. Sewers and drains could be constructed, nuisances removed, water supplied abundantly without any serious interference with the rights of property. But reformers were daunted at the thought of the cost and litigation which would have to be encountered if the work which, all things considered, was the most important, was attempted. Anyone who will look at a volume of an illustrated paper of 1851 will find a view of a small house which was erected by a Mr. ROBERTS, an architect, in order to suggest how easily the great difficulty

could be overcome. Apparently it was better adapted for a gate lodge than for a couple of workmen's families in a city. The cottages which have been erected by the County Council of London outside the Metropolis suggest that the experiment of 1851 was not altogether vain. At the time Mr. ROBERTS'S cottage, though well adapted to select tenants, appeared to be inadequate to meet the difficulty, and philanthropists did not dare to adopt it as a pattern, although the designer was honoured by receiving a medal from the exhibition authorities.

When the experiment was at length made to provide accommodation for the poorer classes, it was not a cottage with a balcony which was taken as a type, but a barrack. Outlay and returns were wisely contrasted, and care was taken to avoid any expenditure which would interfere with a profit of 4 or 5 per cent. Occasionally a wealthy individual like the late Baroness BURDETT-COUTTS, who believed in the benefit arising from details which would be pleasant to look upon, expended money on windows, doors and chimneypieces without expectation of a profit. But as a rule a severe utilitarian standard was set up and adhered to.

It was found that philanthropy and small profits were not sufficient to overcome the evil. Although Acts were passed in 1851 which to some extent authorised housing at the cost of corporations, several years were allowed to pass without any effort being made to enforce the clauses. The Metropolitan Board of Works expended about 2,000,000*l.* in the purchase of unhealthy areas, but they had not the courage to build upon any of them. They considered it was the lesser evil to sell their land to various companies at about one-fifth the cost price, and to leave to the new owners or leaseholders all the risk of putting up cheap dwellings. With the advent of the London County Council more resolute action was entered on, and not only were sites purchased and cleared, but dwellings were erected and let. It is well to recall these facts, because a great many people imagine that in dealing with the housing problem too much precipitancy was allowed in order to seek the favour and votes of the working class. The truth is the difficulty was shirked until it had assumed dangerous proportions.

There have been some modifications in the arrangements for providing accommodation. Sundry types of buildings have been adopted, but a simple test can always be applied by counting the number of rooms. A return issued by the housing of the working classes committee of the London County Council shows the number of rooms provided during the last five years. In 1902 were added 53,499 rooms; in 1903, 59,009 rooms; in 1904, 51,566 rooms; in 1905, 50,937; and in 1906 the number was 43,428 rooms. The part accommodated comprises not only the central area, but the rest of London and extra-London. It will therefore be evident that although there was a decrease last year yet building was not neglected, and it is only reasonable to suppose that sooner or later there will be a sufficient supply of accommodation.

The committee admit the difficulty of determining whether the accommodation is commensurate with the increase of the working classes. Judging by experience  $1\frac{1}{2}$  persons per room is a reasonable figure for dwellings within the county area, and  $1\frac{1}{4}$  persons in the extra London area. By that ratio accommodation for 69,514 persons was added during last year. The increase of accommodation in the working-class population is assumed to be two-thirds of the total increase, or, say, 69,739 persons. Now if the Council's furnished lodging-houses are included it will be found that accommodation has been provided for 70,408 persons. In other words, demand and supply are almost equivalent in amount.

It was stated in an official report on agricultural settlements in the colonies "that the major part of London poverty and distress is home-made and not imported from outside; that the countrymen who migrate

to London are mainly the cream of the youth of the villages, and that country immigrants do not, to any considerable extent, directly recruit the town unemployed, who are in the main the sediment deposited at the bottom of the scale as the physique and power of application of a town population tend to deteriorate."

There are many, however, who do not accept that conclusion. It has been suggested that on the County Council's estates at Norbury, Totterdown Fields and White Hart Lane the tenants of the houses were not all London workmen. An inquiry followed, and it was found that of the 1,026 families on the three estates 691 moved into the Council's cottages from within the county, while 335 came from various places outside London, also that in 895 cases the head of the family is employed within the county. The working classes are not more free from jealousy than those above them in social rank, and hence objections have been raised about outside tenants in dwellings and about outside students in technical classes. Men from the country will find scanty welcome from their fellows within the Metropolis, and they should therefore employ any influence they may possess for the erection of additional habitations in country districts. The mere fact that over 40,000 rooms had to be erected last year should be enough to suggest that the difficulty and costliness of providing for the accommodation of the working classes of the Metropolis are enough of a burden without having an increase of weight imposed on the ratepayers.

## THE ORIGIN OF OPERA IN FRANCE.

By Dr. JOHN E. BORLAND.

SEVERAL generations before France developed a serious opera of her own on the Italian lines she had possessed an indigenous form of entertainment in which dancing, singing and gesture were utilised, namely, the "Mascarades," "Divertissements dansés," or "Ballets-divertissements." One of the earliest was the "Balet Comique de la Roynie," composed by BALTASAR DE BEAUJOYEULX in 1581. The complete text, with pictorial illustrations and music of the songs and dances, was published by the privileged printers, ROBERT BALLARD and his partners, and the rare volume forms a valuable early record of a unique class of entertainment. Similar productions took place in connection with various festivities down to about one hundred and fifty years later; and these, with the musical and dramatic elements growing steadily in importance, dictated to some extent the form which French opera, properly so-called, was destined to assume. In the first half of the seventeenth century Frenchmen seem to have been as diffident of their own powers and of the possibilities of their own language for operatic purposes as English musicians have seemed to be down to quite recent times. It was thought impossible to acclimatise in France any form of serious music-drama on account of a supposed incompatibility between the French tongue and the art of music.

In 1645 Cardinal MAZARIN, wishing to entertain the queen, ANNE OF AUSTRIA, brought to Paris a troupe of Italian performers, who gave a representation of STROZZI's "La Finta Pazzo," with music by FRANCESCO SACRATI, and "les machines" designed and managed by GIACOMO TORELLI. This was not an opera in the full sense of the word, for there was much spoken dialogue as well as singing and dancing. The staging was magnificent, scenery and costumes were in great variety, and among other features a contemporary chronicler mentions that "a ballet executed by monkeys and bears finished the first act." At the end of the second there was a dance of ostriches, which stooped down to drink at the fountain. The spectacle finished with a dance of four Indians offering parrots to the hero. This piece, though so varied and slight in texture, yet contained more music and a more continuous plot

than its hearers had been accustomed to, and one at least showed little enthusiasm for the new venture, namely, Madame DE MOTTEVILLE, who wrote in her Memoirs:—"For my part I find that the length of the spectacle diminishes greatly the pleasure, and that lines simply declaimed represent conversation more easily and touch the soul more than singing delights the ear." In another passage Madame DE MOTTEVILLE wrote:—"On Shrove Tuesday (1646) the queen had one of her comedies in music performed. . . . We were not above twenty or thirty persons in the place, and we thought we should die of cold and boredom." In the same year a tragedy entitled "Ackebat, Roi du Mogol," was supplied with music by the Abbé MAILLY. The scenes, in musical recitative, were accompanied by several instruments, and it was said to be "a great success, although it had not then been discovered how to put our language into vocal recitative, as has been done since." Another Italian troupe, in 1647, performed "Orfeo ed Euridice," libretto by FRANCESCO BUTI, music by LUIGI ROSSI. Parisian opinion was no more favourable to this than it had been towards the lighter production, "La Finta Pazzo," and a rhymed skit of the period runs:—

Ce beau mais malheureux Orphée,  
Ou, pour mieux parler, ce Morphée,  
Puisque tout le monde y dormit.

The Court, however, received with enthusiasm the one factor in this "Orfeo" which it understood, namely, the mounting. This seems to have been gorgeous, and there was a call for more work of the same kind.

The poet CORNEILLE was commissioned to write a "pièce-à-machines" on the Italian lines, and the result was "Andromède" with music by d'ASSOUCY. The music, however, took quite the third place in importance, and according to CORNEILLE himself, even his verses were only accessory to "les machines." It must be remembered that French drama pure and simple was already in a high state of culture, so that it was only the prejudice which existed against the possibility of successfully uniting the French language with music, anything more than simple ballads, that hindered the earlier development of true French opera. This prejudice was so firmly impressed upon the minds of the lyric poets of the first half of the seventeenth century that even the famous writer of lyrics, BENSERADE, so successful with his ballets, never dared to venture on a scene completely set to music.

The solution of the problem was at hand. PIERRE PERRIN, commonly but erroneously called l'Abbé PERRIN (a native of Lyons, where he was born about 1625), held an official post under the Duke of ORLEANS, which led to his making the acquaintance of Cardinal MAZARIN and of ROBERT CAMBERT the musician. PERRIN was a poor poet, but an astute man who made up for lack of art by adaptability. He was convinced of the possibility of using the French language for music-drama, and in conjunction with ROBERT CAMBERT he produced at Issy, in 1659, "La Pastorale," and afterwards repeated it before the king at Vincennes. The work was singularly successful, and was followed by others on similar lines, culminating in "Pomone" (1671). Only fragments of "Pomone" have survived, and very few copies exist of PERRIN's introduction to the libretto, which is a document of sufficient interest to justify the quotation of a few passages from it. After describing what is signified by the term "opera," he writes:—

Those who have never seen such pieces are scarce to be persuaded that they can succeed. They compare them with Greek and Latin masterpieces of antiquity, or rather with what they have seen represented of these subjects in the theatres of Italy. They cannot conceive that the passions and the emotions of the soul can be treated as naturally and as powerfully by means of singing as by the spoken word; and even if this were so they cannot imagine how a piece for the theatre can be satisfactory without plot, or how a plot which consists of serious reasoning, and which naturally fits the speaking voice, can be appropriately declaimed in singing, which has for its domain the finer

emotions of the mind and the expression of pathos. Even those who have seen the operas of Italy in our theatres are of similar sentiment, and believe that these performances would have no better success in our own language.

PERRIN goes on to say that the problem is indeed a difficult one, but by no means impossible of solution:—

The composer requires a marvellous genius, a perfect knowledge of the language and of French poetry and music, and an adroitness not common, to embody nearly all the plot and all the serious discussion in the piece, particularly in a space of time so short as that of our French spectacles. The thing is difficult, nevertheless I dare to say that it is possible, since you will see that it is accomplished in this piece, which contains as much plot in 500 short lines as the longest spoken piece could contain in 2,000, in which, moreover, I am assured that the most critical will have difficulty in finding any faults against either the music or the lyrics.

I confess nevertheless that the brevity to which one is compelled in order to please the national taste prevents the development of the action as completely as in spoken comedy, or even in the Italian pieces with their length of six or seven hours in performance; but it must also be allowed that expression by means of music has quite another force than that of spoken words, since the music can often touch the heart more powerfully in two phrases than can the others in fifty; and that words sung with change of tone, inflections, accents, ornaments, the softening and raising of the voice, express more vividly, more agreeably and with more variety the transports of the soul than can the monotone of the spoken word.

If we add to this the beauty of harmony, which softens the heart and prepares it for expression, the advantage of making several persons utter the same sentiments at once, sometimes of making them say the same words simultaneously with contrary meanings: of the rondeaus, the repeats, the interchange of phrase, and a thousand other devices in words and music—it will not be difficult to give it the preference in all points, and to exact the confession from the most obstinate that these kinds of spectacles comprise all great and honest pleasures, that they uplift the whole man, that they charm the eyes with the sight of magnificent costumes, of superb scenery, of admirable mechanical devices and of agreeable ballets; the ear by the excellence of the song, the accompaniments and the symphonies; the mind by beautiful designs, and the heart by depicting the passions in the most vivid and touching manner which uplifts and transports it. . . . But how make these things agree with experience to the contrary, say the second critics; and if these pieces are so charming, why have they displeased so much when they have been given on our stage in the Italian language? To that I answer in three words:—They have been too long, they have been full of faults—and of these two things we could correct them; but the third admits of no reply—they were in a foreign language; and while they were able to touch the eyes and ears by the beauty of the spectacle and of the music, the mind and the heart, the most noble parts of man, were left untouched.

PERRIN next deals with a third class of critics, whom he calls "the most dangerous and the most reasonable." These are they who doubt whether the French language accommodates itself to music as well as the Greek, Latin and Italian. This doubt he combated vigorously, with frequent illustrations which are too long for quotation. His main argument was that the French language must be dealt with by those who understand it and are in sympathy with it. The remainder of the preface consists chiefly of a summing-up of the musical forces of the French capital, with eulogies upon the skilfulness of its musicians, the culture of its patrons, the grace of its dancers. PERRIN adds with sublime self-possession:—

I have now satisfied the incredulous ones, and shown that not only can these musical pieces be as good and better than spoken plays, but even that we can in our operas equal and surpass the Italians in every point.

ROBERT CAMBERT, who was associated with PERRIN in this work, was born in Paris about 1628. He was a pupil of CHAMBONNIÈRES, the famous clavécinist, and commenced his career as an organist; but having become chief of the queen's musicians and head of the king's violinists, he had opportunity of

becoming acquainted with the light music of the Court in the Mascarades. In association with PERRIN, CAMBERT gradually acquired further experience in dramatic composition, and these two were undoubtedly the creators of French opera, though to the public the name of LULLY bulks much more largely in the musical history of the seventeenth century. Opera, it seems, is a natural forcing-house for intrigue, and French opera began its career in the midst of quarrels and cheatings as disgraceful as any that have ever disfigured the annals of music. After all their work, PERRIN and CAMBERT were juggled out of their just reward. CAMBERT complained bitterly that as long as the work was experimental and only partially successful no one gave them assistance, nor was tempted, on the other hand, to envy them the results. But "Pomone" was a great success, and JEAN-BAPTISTE LULLY (1633-87), who had previously laughed at the idea of opera in French, and had used his influence in Court circles to put every hindrance in the way of CAMBERT and PERRIN, now cast his envious eyes upon their success. Unfortunately, quarrels took place about the same time between CAMBERT and PERRIN and those associated with them in the undertaking, and the cunning LULLY took advantage of the situation to secure the patent rights of opera for himself. The story of the Académie Royale de Musique is too long to tell here in detail, but any who are interested can find the whole facts set forth in NUITTER and THOINAN'S "Les Origines de l'Opéra Français," and in POUGIN'S "Les Vrais Créateurs de l'Opéra Français."

PERRIN died in great poverty in 1676. The fate of CAMBERT has always been somewhat of a mystery. He came to England and worked here for a time, possibly in the service of CHARLES II., and some of his operas were produced here, and are said by POUGIN to have formed the models upon which PURCELL worked. CAMBERT is supposed to have died in London about 1677: some say he was murdered at the instigation of LULLY and his associates, and the charge of murder against LULLY, whether true or false, formed the basis of a brochure published at Cologne in 1688, the year after LULLY'S death, entitled "Lettre de Clement Marot, A Monsieur . . . touchant ce qui s'est passé à l'arrivée de Jean Baptiste de Lulli, aux Champs Elisées." In this satire the author imagines the scene in the Elysian fields when LULLY arrived there to take his place among the spirits of the illustrious departed. His entry was not without opposition, and amongst the crowd of his opponents there were naturally PERRIN and CAMBERT. PERRIN made a strong appeal against the reception of LULLY, and demanded even his severe punishment as a thief of the labours and the reputation of others. He described how he himself was the real creator of French opera, but that the cupidity of LULLY had deprived him of his reward, and that this "Corsair," abusing the credit which his official post gave him, had had the cunning to persuade the king that he himself was the only man in the kingdom capable of sustaining the dignity of the art, and had thereby obtained the exclusive privilege which had cut the throats of so many people.

"Yes, yes, cut the throat," cried terribly a furious shadow who, pushing aside the crowd, was recognised at once for poor Cambert, still quite disfigured with the wounds by which he had been assassinated in England. "You see, madame," continued he in the same tone, "to what the tyranny of Lully has reduced me. The applause which I received from the public for the beauty of my compositions excited his indignation; he wished to become possessed of the lands which I had discovered, and to reduce me to the cruel necessity of going to seek for bread and for glory in a foreign Court, where envy found means to complete, by killing me, the crime which had been commenced in exiling me from my country. But by whatever hand the blows were given which took my life, I impute them only to Lully, whom I consider my veritable assassin and against whom I demand justice. And it is not for myself alone, madame, that I implore your equity; it is in the name of

all those who were distinguished in his time by some rare talent in music, whom he has not ceased to persecute in all sorts of ways."

This satire has never been taken too literally, but allowing for exaggeration due to the bitterness of feeling which was common against LULLY, it is in the main a correct summary of the position. LULLY undoubtedly ousted CAMBERT from his hard-won place, and posterity has not been able to do justice to the earlier composer on account of the disappearance of his scores. But there is sufficient evidence in contemporary records that the best feature in LULLY's work, namely, his management of the recitative, was not only anticipated, but also equalled or even surpassed by CAMBERT. SAINT-EVREMOND, for example, was no particular lover of opera, for he described it as a "bizarre work of poetry and music, in which the poet and musician, equally impeded the one by the other, give themselves much trouble in making a bad thing." SAINT-EVREMOND said, nevertheless, "CAMBERT has had this advantage in his operas, that the ordinary recitative does not weary, through being composed with more care than the airs themselves and varied with the greatest art in the world." And again, "CAMBERT has a very fine genius, sufficient for a hundred kinds of music and all well husbanded, with a just economy of voices and instruments. There is no recitative better conceived nor better varied than his." A contemporary journal also, *Le Mercure Galant*, announcing the death of PERRIN, and speaking of the great success of LULLY, says, "Nevertheless, since the time of the operas of CAMBERT one has seen no recitative in France which has appeared new."

(To be continued.)

#### THE LATE JOHN WHYTE.

WE record with regret, says the *Glasgow Herald*, the death of Mr. John Whyte, lately master of works to the Corporation of Glasgow, which took place on Friday at his residence, Hollybank, Stirling. Mr. Whyte, on his retirement seven years ago, went to reside in Stirling. He was then and until recently in the enjoyment of good health, but he had a shock of paralysis some months ago. Other seizures followed, and after one of these he passed away. A native of Perthshire, Mr. Whyte was born in the year 1829. Twenty years later he came to Glasgow and entered the works department of the Corporation under the late Mr. John Carrick. The modern city was then in the making. The majority of the main thoroughfares had been of the character of country roads, indifferently administered by a number of independent authorities, over whom the Town Council had no control. All round the city—east, west, north and south—new districts were being laid out for building purposes and new streets were being formed, and the work of the department was growing rapidly in amount and importance. At first Mr. Whyte acted as an inspector of works. Afterwards he was appointed assistant to Mr. Carrick, the city architect, his special duty being to superintend the laying-out and maintenance of the streets and the construction and repair of sewers, and to represent Mr. Carrick in the Dean of Guild Court. In this way he bore an important part in the work of city extension, and in carrying out the great scheme of city improvement which did so much to change the character of the congested areas in the central districts and to ameliorate the sanitary and social condition of the people. In an interesting reminiscence address delivered on the celebration of his jubilee, Mr. Whyte stated that when he came to Glasgow in 1849 the total length of streets in the city was 100 miles. In the course of the fifty years that had elapsed this number had been increased to 315 miles. The length of sewers constructed up to 1849 was 42 miles, the total length in 1899 had increased to 123 miles, while the amount of money expended on the paving of streets during the fifty years had been 664,193*l.*, and in the construction of sewers a million sterling. On the death of Mr. Carrick in 1890 the department was reorganised. Mr. A. B. Macdonald was appointed city architect and engineer, and Mr. Whyte became head of the section of which he had formerly had charge, with the title of master of works. This

position he continued to occupy until the year 1900, and on his resignation Mr. Nisbet was appointed his successor. Not alone in connection with the practical working of the department of which he was the head did Mr. Whyte render valuable service to the city; he also took an important part in the framing of several of the local Acts promoted by the Corporation. In particular, the Building Regulations Act was to a large extent based upon the expert advice he was able to give, the result of his long and varied experience. Mr. Whyte enjoyed in a marked degree the confidence of the members of the Corporation whom he served for so many years, while he was held in the highest respect and esteem by his colleagues in the department. On the occasion of his jubilee the staff, which, numbering four persons when he joined, had increased to 118 in 1899, presented him with an illuminated address in testimony of their appreciation of his character and of the admirable manner in which he had fulfilled the duties of his office. A year later he retired, and was awarded by the Council a handsome annual allowance in recognition of his faithful service. A man of genial and kindly disposition, frank and courteous bearing, Mr. Whyte was held in respect by all with whom he had dealings in the discharge of his onerous duties, and he had a large circle of intimate friends.

#### EXETER CATHEDRAL.

THE following report was made by a special committee appointed by the Society for the Protection of Ancient Buildings to consider the question of the new work recently carried out on the west front of Exeter Cathedral:—

Visiting Exeter Cathedral on June 19, we found no work in progress upon the west front, but we readily distinguished the additions of new stonework made lately, since they are executed in a coarse yellow stone. They consist of six canopies (with parts of their supports), inserted in the south wing of the sculpture-screen, also of the cornice of the same wing, the renewal of the latter being carried round the buttress adjoining. Our report will apply to all this work, but is specially directed to the renewal of the canopies.

1. We could discover no reason for these renewals on the ground of their being necessary for the stability of the fabric. For the purpose of giving strength to the structure, surface additions such as these projecting canopies are evidently immaterial. If they were entirely chipped or decayed away, neither the stability nor the permanence of the sculpture-screen would be impaired, nor would the statues be less efficiently protected from the weather.

2. As to the explanation that these renewals are records of the ancient works, and desirable on that account, we cannot see that they constitute any such record. The ancient canopies were of the finest white stone, admirably sculptured, and with expressions of delicacy and finish that claim for the work the highest place in Mediæval masonry. But the renewals are carved in coarse stone, mechanically executed, and with detail ill-conceived and coarsely rendered. To mention only one point—the original canopies were delicately contoured, so as not by too much emphasis to break up the effect of the wall. Those who are acquainted with the practice of sculpture will appreciate the consummate mastery of effect which dictated such details in this sculpture-screen. Though this screen is a most elaborate collection of ornaments, they are nowhere felt to be fulsome or oppressive; the cohesion and dignity of the wall-surface is preserved throughout. But there is none of this distinction or appropriateness in the renewals. For example, the jutting of the canopies has been so much increased beyond the line of the ancient work that their pendants actually crowd upon the heads of the statues beneath. Such substitutions are, therefore, not records of the ancient work, but in their pretension to be so actually falsify it.

3. Being unable to account for these substitutions, as either structurally wanted or as efficient copies, we can only suppose them to be meant as improvements on this famous piece of ancient sculpture, and we are tempted to ask what artist has been bold enough to venture on such an experiment? We think we can rely on a supposition that no acknowledged master of sculpture has been consulted. Experiments of a very hazardous kind seem to have been undertaken without advice from anyone qualified to give

an opinion as to the treatment of ancient sculpture. On the other hand, we notice no attempt to meet the first necessities of a reasonable treatment. The sculpture has been left in a deplorable condition; the statues are fastened up with bits of bent copper wire, and the whole front is thickly encrusted with dirt that hangs in flakes and festoons upon it. In the first place, it ought to be washed. A cleaning of the whole, properly conducted, would show where the original stone is still protected by its ancient preservative coating of colour; some of this colour is still visible at the backs of the canopies and elsewhere, where the clots of dirt have fallen off. It will probably be found that there is in good condition a much larger part of the original surface than can be at present inspected. But in cases where, after a thorough cleaning, the ancient stone is shown to be unprotected and decaying, there proper preservatives should be applied under scientific advice, so that further decay may be arrested. The statues should in any case be secured in their places in the same way as has been done at Wells.

4. Since the additions lately made are neither structurally necessary nor correct records of what has been, and since they are manifestly unornamental, there appears no reason for their retention. There remain in the cloister many pieces of the ancient work that has been cut away for the new stone. We find that most of these pieces are sound at the core, and indeed little decayed on the surface; they seem to have been wantonly sawn off. The ancient sculpture is still shown by them much more nearly than by the clumsy copies that have been substituted. These latter, therefore, should be removed out of the front and the old pieces returned to it—a work perfectly easy in competent hands.

5. We have in this report spoken as archæologists, as practical architects and as students and artists in sculpture. On the ground of our knowledge we condemn these additions to the sculpture-screen as incompetent work carried out under incompetent advice. We do not touch upon the wider question, which the present aspect of Exeter Cathedral offers. But we may say this: that bit by bit the ancient art of this famous English cathedral church is being obliterated. Substitutions of the same kind as those we have seen in the sculpture-screen of the west front have been, and are being, made on all sides of the church. They cannot be justified on any score of either structural repair, of archæological record or as ornamental additions. But by such substitutions the honour of the ancient art is being filched away. The west window was before the late alterations to it interesting historically, and it contained some good glass of the greatest artistic value. In the place of this now appears a counterpart of the ancient work that has value neither as an historic monument nor as a work of art.

WILLIAM WEIR.

July 2.

A "Prebendary of Exeter," writing to the *Morning Post*, says:—To those who know anything of the history of the work the animus of the Society's report is only too plain. The Society was not consulted beforehand. I have had nothing whatever to do with the work with which the Society finds so much fault. But, as a frequent visitor to Exeter, I do know this, that the work has been executed with the most loving care and the intensest desire to preserve whatever it was possible to preserve. The new work has been most beautifully executed and will bear comparison with the old in the perfection of its details. The glass of the west window, which has been removed to make room for a really fine and most interesting window, is described in the Society's report as containing some good glass of the greatest artistic value. It was in reality composed of stained glass of the poorest description, erected in the eighteenth century, when the art was at its lowest ebb. Everyone who really cared for the beauty of the cathedral rejoiced when that miserable eyesore was gone. I do not know whether the Dean and Chapter have it in contemplation to do anything in regard to the statues on the west front. But of this I am quite sure, that they will take the utmost care to preserve every detail of the noble and beautiful building committed to their care and which they

all love so well. Their desire and their intention is to hand down to their successors not a ruin, but a reverently-cared-for Mother Church of the city and diocese of Exeter. To do this the advice of the above-mentioned Society is not needed.

### THE LATE DAVID FARQUHARSON, A.R.A.

A WIDE circle of friends will hear with regret of the death of Mr. David Farquharson, artist, which took place last Friday at Birnam, Perthshire, where he had been temporarily residing. Mr. Farquharson, says the *Scotsman*, was one of the oldest Associates of the Royal Scottish Academy, and had he remained north of the Tweed, where he received his art education, he would unquestionably have been elected to full membership. But his removal to London a quarter of a century ago prevented the Academy of his native country from bestowing that full rank upon him which, had he remained in Edinburgh, his painting abilities would have entitled him to. Older friends of his in Edinburgh will remember his studio at 16 Picardy Place. On his removal to London about 1882 he took up his residence in the artistic quarter of St. John's Wood, but for the last thirteen years or so he has resided at Sennen Cove, Penzance, where his style as a landscapist was considerably affected by the painting of what came to be known as "The Newlyn School." Up to the time he removed to London Mr. David Farquharson was a constant exhibitor in the Royal Scottish Academy, and many of his early pictures are still held and prized by Edinburgh citizens. A group of five, which he exhibited in 1879—before his election to the Associateship—will give some idea of the subjects in which his brush delighted—"Noonday Shelter," "Forest and Lake," "A Lonely Moor," "Entrance to Gleneagles" and "Scottish Gipsies," the last a happy combination of figure and landscape, in which, like many other Scottish landscapists, he was also successful. In 1877 he began to exhibit at the Royal Academy. His first picture there was called "Loading," but although his work, admirably composed, carefully executed and harmonious in colour, was always well hung, official recognition was long in coming. The first of it came to him in 1897, when his picture "In a Fog" was purchased for the Chantrey Fund for 420*l.*—a compliment which was much appreciated by himself and his many friends both in Scotland and England. His triumph, however, came in 1904. He had before that time been producing pictures of great artistic worth, which were well placed and much admired both at Burlington House and the New Gallery. His splendid picture of 1904—"Full Moon and Spring Tide"—took everyone by surprise, and to it was accorded the compliment of being hung in the place of honour in the large gallery, usually reserved for a work by the President of the Academy. In the picture was given a view of Sennen Cove, which, with its terrace of cliffs on which the houses are built, and screen of green heights, was very admirably rendered under soft bright moonlight. The water was a beautiful study. The landscape was unhesitatingly pronounced to be the picture of the year, and on his success Mr. Farquharson was heartily felicitated by critics and artists alike. The picture had an important effect on the fortunes of the artist, for it led to his election as an Associate of the Royal Academy at an age when such compliments are rarely paid. Though the official recognition of the work of this artist was long delayed, it was felt that in the circumstances the Academy could not have passed over Mr. Farquharson, whose election certainly strengthened the landscape element in the Academy. At Burlington House this year Mr. Farquharson was represented by "The Pilchard Season" and a very impressive rendering of "Dark Tintagel, by the Cornish Sea," under pale moonlight, the latter especially being in his best style.

The Exhibition of works of Danish artists at the Guildhall Art Gallery closed on Saturday. The number of visitors has been about 100,000.

A Meeting of the Chester education committee was lately held at which the elementary education sub-committee recommended that the services of Messrs. Douglas & Minshall, architects, be engaged to prepare plans and advise the committee as to the erection of the proposed new Council school for the Boughton district. An amendment moved, that all the architects in the city should be allowed to compete for the engagement, was not seconded, and the recommendation was approved.

## NOTES AND COMMENTS.

POPULAR imagination may have exalted the purchase of the "Portrait of the Marchese GIOVANNI BATISTA CATTANEO," by VANDYKE, into a *casus belli*, and accordingly the average number of visitors to the National Gallery has been exceeded during the past week. But anyone who is able to judge the work impartially is likely to agree that the portrait might have been left in Genoa without the least loss to English artists or amateurs, and that the price given for it is amazing. Many superior portraits can be seen at the present time at Burlington House without any expense to the nation. VANDYKE was an able producer of portraits in his day. But his methods have been surpassed, and there are examples enough to reveal their application. The official respect for old masters is no more than a revival of superstition, and unfortunately it is one that is injurious to modern artists, for ignorant people remain convinced that not only are old works worthy of being bought at enormous prices, but that they are unapproachable in their excellence by ordinary painters.

THE overhead trolley system is the cheapest class of tramway for London, as the cost is 9,500*l.* per mile of single track, while the underground conduit system is estimated at 17,000*l.* per mile. But as there is general opposition to the overhead arrangement the London County Council propose to adopt what is known as the "G.B." surface system for the reconstruction of the Aldgate to Bow tramways. The cost is 10,500*l.* per mile. The system has been in use in Lincoln for about a year. As in other surface systems, the electric energy for propelling the cars is obtained by the contact of skates fixed under the cars with studs on the surface of the road. These studs, which are placed in the centre of the tracks, are brought into contact with cables underneath by a mechanical device operated by magnetic action. The studs are only charged with electricity when a car is actually passing over them. The cost of the trackwork is reduced owing to the much less extensive excavation and amount of material which are required for the installation. The terms on which the system can be employed are as follows:—The Council to pay a royalty of 500*l.* a mile of single line in respect of the existing horse lines in Whitechapel Road, Mile End Road and Bow Road; the same royalty to be paid in respect of tramways constructed or reconstructed for this system up to a total length of thirty miles, including the Aldgate to Bow lines. The outlay on the experiment is estimated at 72,210*l.*, and there can be no certainty that the system may not be superseded by a different arrangement.

## ILLUSTRATIONS.

CATHEDRAL SERIES.—SOUTHWARK: VIEW OF CHANCEL.

LOWTHER TERRACE, GLASGOW.

THE illustration shows three of the self-contained lodgings recently erected in this terrace. The buildings are of white sandstone from Giffnock and Bishopriggs quarries, and the roofs are covered with Westmoreland slates. The low wing to the left of the nearest house contains the hall with winter garden *en suite*, while the low building showing through at the extreme left contains the stable offices, garage, &c. The architect is Mr. JAMES MILLER, A.R.S.A., of Glasgow.

WESLEY HALL, CROOKES, SHEFFIELD.

THIS building is being erected for the trustees in order to provide complete premises for Wesleyan mission work in the Crookes district. The hall is octagonal in plan. This shape allows the seats to be effectively grouped round the platform, so that every hearer may be within easy reach of the speaker's voice. A shallow balcony is provided, and as the octagon is 70 feet in diameter there is a large "well-hole," so that the general effect will be light and spacious. The accommodation is for 900 adults. There are ample

exits and crush spaces, and also a number of rooms for social and other purposes. The walls are built of local stone, and the roofs covered with Westmoreland slates. The cost is over 7,000*l.* The contractors are Messrs. T. ROPER & SONS, LTD., and the architect is Mr. W. J. HALE, F.R.I.B.A., of Sheffield.

GALLERY PLAN

RAWMARSH WESLEYAN CHURCH.

THIS church is being erected for the trustees on a commanding site facing the main street. The plan is of the usual cruciform type, with nave, transepts and galleries, and with the choir and organ in the rear. Three vestries are provided as well as other conveniences. The building is faced externally with Dunford rockies and ashlar dressings. The contract, which is over 4,000*l.*, has been let to Mr. W. H. TREHERN, of Rotherham. The architect is Mr. W. J. HALE, F.R.I.B.A., of Sheffield.

PROPOSED HOUSE AT GILLINGHAM, DORSET.  
RESIDENCE, RIDGE MOUNT ESTATE, SUNNINGDALE.

## THE OLD MANOR-HOUSE, BYFLEET, SURREY.\*

THE manor of Byfleet dates back to the days of Edward the Confessor, when it was held by Erlwyn the Saxon, under the Abbot of Chertsey. In 1179 it was in the hands of Richard de Lucy, Justiciar of England and Keeper of Windsor Castle and the Tower. Sir Henry de Leybourne, who was knighted by Edward I. for distinguished bravery at the siege of Caerlaverock, in Scotland, was enfeoffed of the manor by Geoffrey de Lucy in 1297. Edward II. lived at Byfleet in the early part of his reign, but no record has been found to show how or when the manor became the property of the Crown. Writs and warrants signed by Edward and issued from here exist, perhaps the most important being a warrant ordering the arrest of the Knights Templar in England, bearing the date December 20, 1307. The king gave the manor to Piers de Gaveston, who had married Margaret de Clare, his niece. After the execution of Gaveston by the nobles in 1312, Edward resumed possession, and passed much of his time at Byfleet. Edward III. granted the manor, then assessed at 40*l.*, to his mother, Queen Isabella, on February 1, 1326-7, and in 1331 to his brother, John of Eltham, whom he created Earl of Cornwall. Upon the death of the prince in 1335, the king gave the custody of the park and warren to John de Chestre for life, but visited the manor occasionally, and in 1338 he granted the manor and park to his son Edward—afterwards known as the Black Prince—"and to his heirs for ever, provided they were Dukes of Cornwall and eldest sons of the reigning Sovereign." Prince Edward died in 1376, and was succeeded by his son, Richard of Bordeaux.

Richard II. commenced a restoration of the house in 1378, and this seems to have been going on for twelve years. In 1391 Richard granted the manor to Henry Percy, Earl of Northumberland, but he only had possession for two years, when John, Bishop of Salisbury, obtained a ten years lease of it. In 1399 Richard was deposed, all his grants were revoked by Parliament, and on October 15, in the same year, Henry IV. gave the manor to his eldest son, Henry of Monmouth, as Prince of Wales and Duke of Cornwall. During the boyhood of the prince Byfleet was let to Sir Francis a Court and his wife, Lady Alice de Vere, sister of the Earl of Oxford, but Prince Henry appears to

BYFLEET MANOR-HOUSE: THE FORECOURT.

have lived here after he came of age. Considerable repairs to the royal hunting-lodge and bridge close by were carried out by Henry VI. in 1447.

The manor passed successively through the hands—as Dukes of Cornwall—of Prince Edward of Lancaster, only son of Henry VI.; his cousin, Edward, Prince of Wales, afterwards Edward V.; Edward, Duke of Gloucester, only son of Richard III.; Arthur, Prince of Wales, son of Henry VII., and upon his death in 1502, to the King's second son, Henry, Duke of York, who succeeded to the throne in 1509 as Henry VIII. Tradition connects Henry's childhood with Byfleet, and Aubrey's statement that he was nursed at a house situated on the Wey, between Newark Abbey and the Earl of St. Albans' mill, seems to indicate

that it was at Byfleet Manor-House, though some authorities believe it to have been at Dorney House, Weybridge. Henry VIII. in 1540 annexed Byfleet to the Honour of Hampton Court.

In 1609 James I. granted the manor to his eldest son, Prince Henry, and upon his death, three years later, he gave it to his queen, Anne of Denmark, who took a great deal of interest in Byfleet and effected considerable repairs. Norden, in his "Survey of Windsor Forest," in 1607, gives a description of Byfleet Park, and in a plan shows a large group of buildings with a square garden, one wall of which still stands. In 1618 a survey was made of the park, and the queen, according to Aubrey, "began to build a noble house of brick." The queen died in March 1619, when the

BYFLEET MANOR-HOUSE: JACOBEOAN ENTRANCE GATEWAY.

king gave Byfleet to Sir James Fullarton, formerly tutor to Prince Henry, and he probably completed the building, of which the Jacobean gateway, forecourt and some of the walls still remain. After the Restoration the manor came into the hands of Henry Jermyn, Earl of St. Albans, Controller of the Household to Queen Henrietta Maria.

In 1690 it was owned by a family named Warburton, and while in their possession the present structure was erected, probably about 1724-34, the materials of the old house being employed in the rebuilding. The Hon. Thomas Murray rented the house in 1763, and ten years later it was leased by the Crown to Henry Pelham, Duke of Newcastle, together with Oatlands. In 1804 Frederick, Duke of York, son of George III., purchased the manors of Oatlands, Byfleet and Walton, and from this date its connection with the Crown ceased. The duke mortgaged the property heavily, and upon his death, in 1826, it became the property of Mr. E. Ball Hughes. Lord King, Baron of Ockham, purchased a portion of the manor in 1829, which came to his son, the Hon. P. I. Locke-King, upon his death in 1833. Mrs. Albert Rutson, the present owner, bought the property in 1891, added the wings and carried out a thorough repair to the house, and she has subsequently acquired the adjacent farm buildings and land.

In the garden is an underground passage, or drain, of some size, that probably belonged to the royal hunting-lodge.

For the foregoing description of Byfleet Manor my thanks are specially due to Miss Frances J. Mitchell, for having placed at my disposal the proofs of a very carefully compiled and most interesting paper recently prepared by her for publication in the "Surrey Archæological Collections."

\* Read at a meeting of the Upper Norwood Athenæum on May 25, by Mr. Frank E. Spiers.

## PREPARATION OF A PAPER.\*

IN offering this brief note for consideration, I cannot pretend that it is in any way a paper in the ordinary sense. I should wish it rather to be taken as the first of those communicated contributions from members for which the President and his predecessors have pleaded on several occasions, without evoking the response so modest a request merited. I think there are two sufficiently good reasons why a note on the preparation of a paper will not be without interest and value. It is a good sign that at our meetings a large proportion of those attending regularly are young men. Several have already given papers, and probably others would if they could feel sure that they would acquit themselves with credit. My first object is to try to dispose of any notions lurking in the minds of our junior members, that they, at least, can know nothing worth imparting to the whole body of members. I also wish to make it clear that writing a paper and preparing illustrations therefore do not constitute a very formidable undertaking. In the second place, I may say that this paper was suggested by remarks at general meetings which have fallen from past presidents, Messrs. Walter Jones and Jno. S. Palmer, who have mentioned the matter on more than one occasion. I hope to be able to impart some hints which will help members who read papers to raise the standard of the printed proceedings. It would be impertinent on my part to attempt any serious criticism of the technical features of the papers read, but speaking as an engineer who has abandoned the rule for the pen, I may perhaps be permitted the remark that, although the outside covers compare favourably with the Proceedings of some other older and wealthier societies, the general style of our own Proceedings inside might easily be improved, if a little more attention were paid to some first principles when the papers were being prepared.

The choice of a subject is usually more troublesome than the actual work of writing. Without being hypercritical, it is not over-stating facts to remark that some of the papers which have been read before this Institution have hardly been worthy of a permanent place in the Proceedings, and the reasons for this unsatisfactory state of things are not far to seek. The subjects chosen have been either too comprehensive to admit of adequate treatment in the space and time allowed, or they have been discursive and consequently, while sometimes provocative of useful discussion, have not disclosed information likely to be useful to the members, who presumably come to the meeting wishing for information in connection with the profession. It seems to me that the first and chief characteristic of a really useful paper lies in its practical character and its completeness. Comparatively restricted subject-matter, if it can be worked up so that all sides are examined, if it is turned inside out and every detail thrashed out, will prove more valuable than the presentation of the main outlines of a big scheme. Looking through the back volumes one is struck by the fact that the best discussions—those which must have helped business most—have often been those following papers of comparatively circumscribed interests. This ought to afford a clue and point the moral that it is quite a mistake to suppose that the method, or line of conduct, which is obviously that of the least resistance to our own mind may have occurred to our neighbour. It is one of the surprises of journalistic work to find what a lot of people there are who know nothing about many matters most nearly connected with their own daily occupation. May I mention a case in point? At a meeting held in the room at Storey's Gate last year the question of the path followed by a body of water circulating through a radiator came up for discussion. In ten minutes three of our past Presidents advanced as many theories and threw out as many hints about coupling the pipes so as to direct the circulation and throttle the flow. Those hints ought to have been worth three times as many sovereigns to those interested and engaged in contracting work. Nowadays it is perfection in respect of small details which pays dividends.

After choosing a subject nothing pertinent to the matter ought to be omitted from the paper. This suggests the next characteristic to be aimed at, namely, a terse conciseness. If all that can be said is to be stated, and that well, the writing must be "lean." Unnecessary verbiage, excursions into side issues even remotely relevant, must be left severely alone, or cut out with a merciless hand, if from lack of practice they are allowed to slip into the first draft,

for every paper will, of course, be rewritten at least once. The question of style must be left to the individual, but one or two hints may not be out of place. It is sound advice to recommend members to avoid the use of the imperative mood in conveying information. May I repeat the sense of that sentence, because I want you to look at it and compare it with my next. Don't use the imperative mood in constructing a sentence intended to convey information. Spoken, this form is not objectionable, and in the workshop it has an authoritative directness about it which makes it desirable. In cold type it does not appear so pleasant nor convincing as a more persuasive form. Speaking from a purely selfish point of view, that of the journalist who has to transpose your remarks from the direct into the oblique narration, when the present tense of the article is altered to the past of the newspaper report, I counsel the sparing use of the first person singular. Quite apart, however, from my point of view the little letter sprinkled like milestones or lamp-posts over the page does not suggest a becoming modesty.

When the draft has been written it should be put aside for a few days before the revised clean copy is made. This plan allows the ideas, remarks, comments and all the rest of the good things which have been committed to paper without banishment from the mind to simmer there. Then when the revision is undertaken little errors and omissions will be noticed and general improvements can be introduced. It is surely not too much at this time of the day to ask on behalf of the secretary that this revised copy should be typewritten. Mr. Taylor is a busy man, your publication committee is composed of busy men, therefore anything that will facilitate their work is not to be despised. Typing is not expensive, and fame, in the shape of a place in the year-book, is cheap at 1s. per thousand words. A word about the time for sending in. A paper to be read at any meeting ought to be in the secretary's hands within one month of the date when the preceding meeting was held. That only allows three months for the paper to be considered in committee, composed, if accepted, read in proof by the editor—I do not know who holds that post—the revised proof sent to the writer for corrections, which have to be carried out before it can be printed and copies prepared and despatched to the members. Three months may seem a long time—it would be in a newspaper office—but publications of papers such as we have here are mere incidents in an otherwise busy round of work, and as such the proofs demand prompt attention and speedy despatch when they come to hand. May I put in a word for a thoughtful revision of the proof? I am quite aware that when a piece of printed matter lies before its author for the first time it looks very different from the original. So much that might have been written is found to have been omitted, and much that is there seems indifferently well expressed when it is in black and white. The author should weigh well the reasons before interpolating a lot of new matter or making extensive corrections. Your secretary has probably carefully calculated the time your paper will occupy in preparing his agenda, and in any case the balance in the hands of your treasurer will suffer diminution exactly in proportion to your greed for corrections and alterations. You will have the right to reply to any criticisms, and that occasion affords an opportunity for elucidating points which may not be clear, or for supplementing the information imparted. There are two practical methods of reproducing sketches illustrating a paper. The simplest, least expensive to prepare and, when made, most convincing to a mechanically trained man is the block made from a line drawing. The sketch should be made on a Bristol board or a smooth drawing-paper with Indian ink of good colour and quality. The preliminary lines in pencil, and not inked in, need not be rubbed out if they are quite faint, but coloured inks of any kind are not permissible. Blue does not come out in the reproduced sketch at all, but red would appear black though not always of a good colour. Black lines on a white ground are all that are favoured by the blockmaker, though hatching may be indicated by blue pencil marks over the surface to be covered. What is known as a "tint"-dotted shading can be produced, also photographically, if the original is lightly shaded with a blue pencil. The fact that these "tones" can be made by means of screens is not so well known as it might be. In the preparation of a paper or the publication of a catalogue, knowledge thereof would often save a good deal of time in the drawing office. A popular and, with good paper, satisfactory way of illustrating any article is afforded by the half-tone block. This is made from a photograph of the article or articles to be illustrated.

\* From a paper by Mr. W. A. Young (Associate Member), read at the meeting of the Institution of Heating and Ventilating Engineers.

If you will examine some of the half-tone drawings which have appeared in the Proceedings, you will find there is an absence of background. That of the man standing beside the fan, which Mr. Yates used in his paper on the Ventilation of the House of Commons, is a recently-published example. It will be noticed from this illustration that the outline stands out clearly on the white paper. This is because the photograph was either carefully cut so as to remove all the extraneous surrounding details, or those undesired details may have been painted out with Albanine and Chinese white mixed in equal parts. When it is desired to have vignette shading round the object a little Payne's grey to tone down the contrasts may be employed. If, as sometimes happens, the photograph available is not sharp, or too much of it is in shadow, a good deal may be done to improve matters by retouching the surface with Payne's grey, in which a little carmine has been mixed to bring up the medium to a warm tint in accordance with the tone of the photograph. A brown print slightly leaning to a blue tone from a sharp clear negative with plenty of contrast in it reproduces as well as any, but good work is also obtained from bromide or platinotype prints. Our own blockmaker tells me that he has a liking for prints made with "Dekko," a gaslight paper. If the article to be photographed can be prepared specially for the work it may be painted French grey, the paint being made up without oil which will give a dull matt surface. Any letters on it should be picked out white. There are no better colours than these for getting good photographs of machinery. A third plan, which I am not going to advocate for illustrating a paper, though there is probably no better one for catalogue work, involves the cutting of a wood-block from a photograph reproduced upon it, and then the making of an electro from the matrix thus obtained. Illustrations of this kind have appeared in the Proceedings, but they have looked too much like catalogue blocks. I, for one, would bar their use. Still, the electro combines the good printing qualities of the line on practically any paper, with the faithfulness to details of the half-tone. Its first cost is against it, and therefore, when only one block is required, or only a small printing is necessary, the expense is usually prohibitive.

When a sketch for reproduction requires alteration or correction, the use of an erasing medium should not be resorted to under any circumstances. Such methods destroy the surface of the paper or board, and almost invariably the alteration produces a ragged line which faithfully reappears on the block, unless the graving tool is employed afterwards, of course, at an extra charge. If only a small mistake has been made, say by over-running a line, or by ruling solid where a dotted line was intended, a little Chinese white spotted on with a fine pencil (brush) will do all that is necessary. The white should be of such consistency as to cover the black ink with one application. When, however, the alteration represents a considerable proportion of the whole sketch, the plan to follow is to cover the part involved with a piece of good drawing-paper and work out the new details on that, taking care to connect the lines on the Bristol board accurately and completely with those on the patch where the joints are on the edges. This, of course, only applies to line drawings which will be made as zincographs. The colour of the patch need not be exactly that of the board, a piece of drawing-paper, even if it has a cream tint, will not make any difference to the result from a good white Bristol board on which it may be stuck.

Finally, it should not be forgotten that the quality of the lines counts for a great deal in the result. A thin weak line in the original becomes woefully attenuated in the reduction, and consequently a sketch for reproduction ought always to be heavier than would be deemed good practice in the drawing office.

#### A TRAFFIC BOARD FOR LONDON.

THE general purposes committee of the London County Council have issued a report in which they say:—We have to report that on July 1, 1907, we received a deputation representing the Browning Hall Conference on Housing and consisting of about thirty persons, including Lord Ribblesdale, Sir David Barbour, Sir John Dickson-Poynder, M.P., and the Right Hon. Charles Booth, with regard to the urgent need for the establishment of a Traffic Board for London, as recommended by the Royal Commission on London Traffic, appointed in 1903 to consider the question of locomotion and transport in London.

We desire to remind the Council of the circumstances

which led up to the appointment of the Royal Commission. The question of underground locomotion has upon no less than four occasions during the past fifty years been the subject of inquiry by Parliament through the medium of various select committees before which the late Metropolitan Board of Works and the Council were represented. Upon each of these occasions the need of a general comprehensive system, which should provide communication between the various main lines of railway has been fully recognised. In addition the necessity for having one permanent authority to deal with all underground railway proposals has been generally admitted.

In 1901 a joint select committee of both Houses of Parliament on underground railways, which had referred to them a variety of deep-level railway schemes promoted in that session, recommended, *inter alia*, in their report:—

(1) That all underground railways should be subject, within certain specified limits, to the control of a central authority; (2) that in some way there should be a more direct control and supervision of all projects for underground railways; (3) that the powers under the Light Railways Act, whereby a local authority may construct or assist in the construction of light railways, should be extended to the City Corporation and county councils with a view to lines being extended into thinly populated neighbourhoods, thereby relieving congested districts; (4) that the Board of Trade should hold an inquiry into a system of locomotion by means of subways or shallow tunnels.

In view of the fact that nothing was done by the Government to give effect to the above recommendations, an informal deputation from the highways committee waited in January 1902 upon the President of the Board of Trade and the Lord Chairman of Committees and urged that, in view of the fact that all the Bills introduced in the session of 1901 had been suspended until 1902, and that in addition a large number of new ones had been introduced, "some controlling authority should be established to which the question of locomotion, so closely connected with the provision of housing accommodation, the control of the increasingly congested traffic of London and other important problems should be referred, and that only such projects as might be approved by that authority should be allowed to be brought before Parliament."

The result of the legislation of the session of 1902 as regards underground railways in London was that out of 82 miles of proposed new lines the construction of only four miles was authorised.

Having regard to the urgency of dealing with the underground railway system of the county of London, the advisability of establishing a scheme such as would not only meet present but future needs commended itself to the Council, which, in October 1902, referred it to the Parliamentary, highways and finance committees to consider the advisability of the Council promoting, in the session of 1903, a Bill on the subject. As the result of a conference between the three committees above referred to it was found impossible for the Council to promote, within the time limited by the standing orders of Parliament, a Bill such as was proposed. On the other hand, it was felt that perhaps a more effective method would be to invite the assistance of the Government in a general investigation into the construction of tube railways and underground means of communication, and accordingly, on November 11, 1902, the Council passed the following resolution:—

That, in the opinion of the Council, it will be detrimental to the interests of London if any Bill for the construction of a tube railway is proceeded with in Parliament until a full inquiry shall have been held and a report presented upon the following questions:—

1. How far it is possible to adapt the provisions of the Light Railways Act, 1896, to underground railways in London as recommended by the Joint Select Committee of 1901.

2. Whether it is possible and desirable to formulate some general scheme of underground railway accommodation capable of serving the requirements of London as a whole, and if so what should be the main features of such general scheme.

3. Whether a system of deep-level tube railways will afford the best results, or whether it will not be preferable to adopt either wholly or partially the system of underground locomotion in operation in continental and American cities.

4. How and by whom such general scheme can best be carried out, having regard to the general traffic within London, the special need of supplying means of access to

the suburbs, the housing problem, the need for cheap fares, the raising of necessary capital, existing means of locomotion.

On February 7, 1903, it was announced that the Royal Commission had been appointed. The following were the terms of its reference:—

1. As to the measures which the Commission deem most effectual for the improvement of the same (locomotion and transport in London) by the development and inter-connection of railways and tramways on or below the surface; by increasing the facilities for other forms of mechanical locomotion; by better provision for the organisation and regulation of vehicular and pedestrian traffic, or otherwise.

2. As to the desirability of establishing some authority or tribunal to which all schemes of railway or tramway construction of a local character should be referred, and the powers which it would be advisable to confer on such a body.

The report of the Royal Commission which was issued in June 1905 is contained in eight volumes, and is a most valuable contribution to a subject of very considerable importance to London. Our consideration of the Commission's report has been rendered comparatively easy by means of a synopsis prepared by the clerk of the Council. The synopsis divides the report into three portions, and shows that—

Part I. deals with the general question of locomotion.

Part II. deals with the improvement necessary in the means of locomotion and transport, and contains recommendations under the following heads:—

1. Street improvements:—(a) Street improvements; (b) Building laws; (c) Main roads leading out of London.

2. Tramways:—(a) Tramways; (b) Procedure for obtaining authority to construct tramways and question of veto.

3. Railways:—(a) Railways; (b) Railways in shallow subways; (c) Operation of urban railways and tramways in large systems; (d) Other questions connected with London railways.

4. Traffic regulations and other matters.

(Under seventeen sub-heads.)

Part III. relates to the formation of a Traffic Board and contains recommendations under heads as follows:—

(a) The creation of an authority with limited and special powers; (b) The powers and duties of the proposed Traffic Board; (c) Other duties the Traffic Board may be required to perform; (d) The constitution of the Traffic Board; (e) The cost of the Traffic Board.

The Commission's conclusions may be summarised thus—

1. *Improvement of means of locomotion and transport* urgently necessary in the interest of public health and convenience and for prompt transaction of business and solution of housing question.

2. *Narrowness of streets.*—Comprehensive scheme of street improvement necessary.

3. *Building laws and regulations* dealing with preservation of forecourts, &c., required.

4. *Tramway development* urgently required. Termini in central streets to be avoided. East and west and north and south lines needed. Preference to be given to street improvements which will assist tramway extension. Absolute veto should be abolished and preferential rights in regard to tramway construction given to certain authorities.

5. *Further development of railways* governed by the features of existing and authorised systems which require to be extended and improved. Additional facilities required for suburban passengers arriving at termini outside central area. Railways should be underground in central districts and shallow in preference, generally speaking, to tube. Urban railways should wherever possible have four lines. Cheaper type of through tube lines coming to the surface in the suburbs is to be aimed at. Local authorities might, if necessary, be authorised to give financial assistance direct or indirect in the construction of lines. Local authorities to be empowered to make special arrangements for guaranteeing companies in regard to workmen's fares charged in new districts. Promoters to be enabled to purchase by voluntary agreement land in districts to be opened up.

6. *Traffic regulations.*—Special attention required in regard to (a) improved regulations for traffic; (b) the avoidance of certain oversights or defects in the construction and maintenance of the streets, the removal from them of fixed obstructions in certain cases, and the control in the future of the erection of such obstructions; (c) the introduction of a system for minimising the evils caused by the breaking-

up of the streets by persons and companies having statutory authority to do so; (d) the regulation of the use of the streets by costermongers and itinerant vendors; and (e) the removal of special obstructions to traffic.

7. *Main roads.*—A comprehensive plan for the improvement and construction of main roads leading out of London should be prepared, and arrangements made for carrying out such plan and for the proper maintenance of the roads when constructed.

8. *Improved building laws* required for application to districts not yet built over. Building plans might be prepared for particular areas.

9. *Law affecting traffic control*, and prescribing the respective functions and powers of municipal, local and other authorities, should be simplified and consolidated.

10. *Traffic Board.*—A Traffic Board with certain consultative and advisory functions should be appointed with jurisdiction over "Greater London."

The deputation which we received on July 1, 1907, represented that in the interests of people living in and around London, and with a view to providing a solution of the difficulty due to excessive congestion of the population, improved means of communication and the linking up of existing means of locomotion were necessary, and further that the solution of the housing problem was inseparably connected with the provision of a complete system of transport, and the deputation therefore desired to urge the Council to approach the Government with a view to the establishment of a Traffic Board on the lines recommended by the Commission. The deputation laid stress upon the fact that such a board would not interfere with the work of the Council or of any other local authority, as it would simply act in an advisory and not in an executive capacity, and would keep before it the needs of London as a whole in the matter of transit. The deputation did not propose that the Traffic Board should be a detached municipal body, but should be in conjunction with and subordinate to one of the public departments of the State, such as the Board of Trade.

As the result of a careful consideration of this difficult and complex subject we feel that the establishment of an authority competent to deal with the question of locomotion and transport in London is desirable, though we are not at the moment prepared to express any opinion as to the precise constitution of such an authority. We are supported in this conclusion by the circumstance that the President of the Board of Trade, in a speech on the occasion of the opening of the Hampstead, Euston and Charing Cross railway on June 22, 1907, made it evident that the Government were not opposed to the suggestion of the Royal Commission, but were in fact alive not merely to the importance but to the urgency of the problem. We recommend:— "That it be referred to the general purposes committee to arrange for a deputation to wait upon the Prime Minister to urge the necessity of His Majesty's Government securing the immediate establishment of a London Traffic Board upon the lines indicated in the report of the Royal Commission on London Traffic."

#### CLONMACNOISE, KING'S COUNTY.\*

CLONMACNOISE, or the "Seven Churches," a large and interesting group of early buildings, lies in the King's County, the barony of Garrycastle and parish of Clonmacnoise, on the south-east bank of the Shannon, some eight miles to the south-west of Athlone.

Founded about 548 at a place called Ardtibra, it owed its origin to the devout Kieran, called "mac an tsaor," son of the wright, from the trade of Boenan, his father. Kieran, aided in the building of his wooden church by the fugitive Prince Dermot, prophesied the latter's advancement, and the grateful monarch favoured and endowed the monastery of his friend when the prophecy was fulfilled. Kieran only survived a few months, and died at the early age of thirty-three. The monastic city grew ever in sanctity and importance. Lying at the actual centre of the island, its fame spread to the four coasts. It became a great college, but in the Norse wars its fame and accessibility exposed it to unusual suffering, not always at the hands of the heathen. In 830 the graceless king-bishop of Cashel, "Felim mac Criowhane," made a great slaughter of its clergy and burned its houses "up to the church door." He again plundered the

\* From the description by Thomas Johnson Westropp, M.A., M.R.I.A., prepared for excursion of Royal Society of Antiquaries of Ireland.

Termon in 843, it having meanwhile been spoiled and burned by the Danes in 834 and 839. The fierce Prince Tomar, of Dublin, burned it in 922; the Danes and Munstermen (unnatural allies) plundered it in 948 and 953; the Ferrals and Munstermen in 1044. In 1080 Donnel O'Melaughlin, king of Meath, made great slaughter, and also burned the houses in the nuns' churchyard. It was again and again plundered; in 1135 it was burned. Meiler fitz Henry and William de Burgo, with the Normans, spoiled it in 1200, 1202 and 1204, leaving it waste and void in houses and gardens. In 1227 O'Melaughlin broke the record by burning it thrice in three months. Cahall O'Kelly burned it in 1283, and its career closed by its sack by the garrison of Athlone in 1552, from which it never recovered.

We must with equal brevity note of its buildings that the great stone church was made by King Flan and Abbot Colman about 904, and rebuilt or repaired between 1089 and 1103, and again in 1336 and about 1460. The Little Church, or "Eaglais beag," is named in 947 and 977. Temple Cillen was built about that time, Temple Conor in 1010, Kill Kieran or the Hospital in 1087, and O'Kelly's Church in 1167. The Nunnery stood at least in 1026, when the great toghar or causeway was made; it was repaired by Queen Dervorgilla after 1172. O'Rorke's tower (perhaps the rude upper storey) was built in 1124. Liss an abaid, the abbot's fort, most probably where the castle stands, was burned before 1135. The castle itself was built by the Normans about 1208.

Clonmacnoise might well be called the central spot of early Christian Ireland, the great collegiate city—a focus of piety as well as of learning. It was not without deep and clear insight into Irish feelings and facts that the astute Norseman, Turgeis, presided at Armagh and set his wife Ota over Clonmacnoise; he had his hand on the head and the heart of the Irish Church. One must think of Clonmacnoise as a complex "city of God," not as a cloister. Nearly every writer about it alludes at some length to its loneliness and the sense of desolation hanging round its site, till they have impressed on it a character for seclusion that warps the clear understanding of its nature. "The secluded retreat of the sons of the noble," as some at one time mistranslated its name; the homely "Plain of Nos pigs" (or "sons") at least omitted this element of misrepresentation. It was no such monastery as that on the peaked rock of Skellig in the bosom of "the great endless deep," but rather a primitive Oxford, a city, see and colleges. The city of Kieran was in a central position, on the main waterway and safest road of the island, and accessible by water from all the monasteries of the Shannon and its tributaries. Indeed it suffered from its very accessibility and from lying on the track of hostile navies. Even in its present desolation it does not suggest the loneliness of Glendalough or Innismurray; how much less when its slopes were crowded with the huts and its river with the "currachs" of its countless monks and students.

It is, however, a very impressive spot; the great flats of marshes and water patches reaching northward and westward have nothing in them to distract attention from its ruins. Devoid of picturesqueness, they only emphasise and throw into relief the remarkable group of churches and towers spreading down the slope of the green "escar" till they almost reach the reeds and sedges of the Shannon. Very impressive, too, is the approach by water, as the confused masses of ruin and the round tower on its bold escarpment rise against the sky. This is far the best line of approach, for by land we drive through an unattractive country, losing sight of the distant towers across the bogs soon after leaving Athlone, nor do we see them again till we are within about a mile from them, when they look insignificant and soon disappear again behind the low green hills. Probably the finest views are those from the causeway to the Nuns' Church, and from the green ridge to the south-west of the main group.

There the shattered fortress with its leaning towers and green earthworks in the foreground; the river, winding through the endless flats from the distant towers and spire of Athlone; the bold round tower, its more perfect but less conspicuous companion; the cathedral, with its surrounding churches; the high crosses and thickets of tombstones combine to form a most striking view, which (glorified by non-existent rugged hills and by a sunset to the north) makes the beautiful but deceptive picture in Bartlett's work and the books of its many copyists.

The ruins consist of the main group with the outlying Nuns' Church to the east and the entrenched castle to the west. The central group includes—1. The cathedral, or

Coghlan's Church, once known as Temple mac Dermot. 2. Temple-Rí, or -Melachlin. 3. Temple Kelly (levelled). 4. Temple Kieran. 5 and 6. Temple Douling and Temple Hurpen. 7. Regles Finghin, with the attached round tower. 8. Temple Conor, now used as the Protestant church. 9. Site of Temple Killen. 10. Site of Temple Ganly. 11. Site of Bishop's Chapel.

Besides, there are the fine round tower, two high crosses, a lesser cross and many inscribed and carved slabs. There seems to have been a hospital on the site of which O'Kelly's Church was built. The two wells are Tober Kieran and Tober Finghin; the last is low-lying and frequently covered by the Shannon. In 610 Gorman, who had spent a year over Tober Finghin, died on pilgrimage at Clonmacnoiss. . . .

*Temple Finghin.*—On the northern edge of the cemetery, almost in the marshes of the Shannon, is perhaps one of the most exceptionally interesting churches in Ireland. It has been too often discussed with deep prejudice, which we must try and avoid. To Dr. Petrie and his more orthodox followers it afforded the most striking evidence for the late origin of the round towers; Brash examined the whole question, and arrived at an opposite conclusion, and after careful planning and examination on several occasions, we must confess ourselves converted from the view that the tower was an afterthought. However, we have not satisfied even ourselves on this problem, and must give it as we find it. We think that there was an existing tower of most unusual character, that a small church was attached, and that in the late eleventh century, or even later, an enlarged chancel was built; that then, so awkward was the effect of the tower bulging into the church, where an angle was expected, that a clumsy attempt was made to cut such an angle, and this work was continued till traces of settlement and collapse stopped this dangerous makeshift. It is almost a miracle that the half-undermined Cloictheach did not crash down into its intrusive neighbour.

When we examine the junction of the church and tower we find that the beautiful ashlar facing of the latter has been rudely hacked away; that the recess and corbelling were made as an afterthought, and that the tower cracked inside from this design; that a rude groove cut in a descending curve round a quadrant of the tower to allow the roof to set into it was also a clumsy makeshift; that the courses and masonry of the tower and church do not correspond; that, in short, whatever its age, the tower was adapted to suit the church, and neither contemporaneous nor later than the latter. Were it otherwise surely the tower would have been beside the church, as at Tamleacht Finlagan, or been decently embodied in the later walls as at Lusk, or built over some portion like at Ireland's Eye or Trinity Church, Glendalough.

Nevertheless the satisfactory conclusion seems as far off as ever. Why has the tower no upper windows below the cap, as all similar structures known to us (save the tower of Hythe, in Kent)? Why is the doorway on the ground-level and facing north? Why do all the apses face the south? Nothing more unsuitable for a castle, or a belfry, or an anchorite's residence, or, let us add, a temple, could well be designed. A store place is just conceivable; but what then about the unlighted top storey, and of course such a store could in no way be defended against attack.

## THESSALY.

A CORRESPONDENT of the *Glasgow Herald*, who is yachting near Thessaly, says the city is the largest after Constantinople. European Turkey is rarely visited by tourists. It lies off the usual track to-day, although the great road from the Western to the Eastern capitals of Imperial Rome ran through it in ancient times. The old name, Therme, was changed to Thessalonica about 400 B.C. by Cassander in honour of his wife Thessa, sister of Alexander the Great. In St. Paul's day it was the capital of the whole country from the Adriatic to the Black Sea, and it is the capital of Macedonia to-day.

Not even Constantinople itself presents more varied "street scenes" to reward the visitor. The Turkish masters swagger at the cafés, or ride their long-tailed barbs through the narrow thoroughfares. Greeks in their national garb, Albanians dressed in a general effect of embroidery and knife-handles, priests in tall caps and veils, Jews in elaborate and variously coloured costumes meet the eye wherever one may turn. Some of these Salonica Jews claim to have been in the city from earliest times, whilst many

took refuge here from Spain. The women wear their hair in a long green bag, ending in pearl embroidery and fringe. Sometimes this covering of the tresses is red, and then one recognises the wearer as a widow. Certainly their vivid clothing adds much to the interest of the scene—a thing one scarcely expects from Jews.

Old walls, whitewashed now, still bound the city, and on the high ground overlooking the harbour is the citadel, with its seven towers—once the Acropolis. On the shore is the picturesque White Tower built by Sultan Suleiman in the sixteenth century to command the port and roadstead. An arch, built to commemorate the triumph of an emperor (people dispute whether the victor was Gallienus or Alexander) spans the Roman road crossing the city from west to east.

Splendid churches built in the first centuries of the Christian era are now the Turkish mosques, but they are much less disfigured and disguised than are the churches of Constantinople. The round church of St. George, built probably about 400, is the most beautiful example of Byzantine mosaic in existence. The work is exceedingly fine; the cube used is smaller than that used in St. Mark's in Venice, or at Monreale, the smaller size giving a refined and beautiful effect, difficult to describe on paper. A ruined ambo from this church is now in the Imperial Museum in Constantinople, a superb mosaic indeed. The church of Holy Mary, now the mosque of Eski Djouma, is very large and magnificent, gleaming with marbles and glittering with mosaics.

#### HEIGHT OF BUILDINGS IN GLASGOW.

TWO appeals from the Dean of Guild of Glasgow were heard before the Lord President and Lords Dundas and Johnston in the Court of Session, Edinburgh, on Saturday. The Summerlee Iron Company possessed ground which faced to West George Street, and the rear of which was to West Regent Street Lane, which lane is parallel with West George Street. The company proposed to put up a high building extending over the whole of their property with an elevation to the street and to the lane. The height of the proposed building was affected by sections 60 and 62 of the Glasgow Buildings Regulation Act. The first sub-section of section 60 provides that "no building other than a church shall, except with the consent of the Corporation, be erected in, on or adjoining any street of a greater height than the distance between the building lines of such street and one-half more of such distance, and in no case except with such consent of the Corporation shall such height exceed 100 feet." The proposed building exceeded 100 feet. It did not exceed one and a half times the breadth of West George Street, but it did exceed in height one and a half times the breadth of West Regent Street Lane. Accordingly the company addressed a letter to the town clerk in which they enclosed a plan of the proposed building, and they asked for consent of the Corporation. That consent they got, and armed with it they asked the Dean of Guild for a decree in the ordinary way and the decree was granted. In terms of sub-section 3, section 60 of the Act, the Summerlee Company advertised that they had got the consent in order that persons who conceived themselves aggrieved might object. Messrs. Lindsay, Meldrum & Oates, solicitors, who had property in the immediate neighbourhood but not exactly touching the company's property, presented an appeal to the Dean of Guild against the consent of the Corporation. At the same time the same objectors appeared before the Dean of Guild and objected on the ground that there had been no proper consent given, and that the building was struck at by the provisions of sections 60 and 62. The Dean of Guild held that the objectors had no title to plead the provisions of the Act at all, on the ground that the privilege of pleading these provisions was limited to the Corporation. He accordingly granted the decree. In the appeal against the consent he said he saw no reason for disagreeing with the consent which the Corporation had given. Both these judgments were brought before their lordships by the objectors.

Their lordships remitted both cases to the Dean of Guild to proceed as should be just. No expenses were found due to or by either party.

The Lord-President said he could not agree with the ground upon which the Dean of Guild disposed of the objections. He could not think that the universal proposition that no private individual had ever any title to plead the prohibitions of the Act was a just one. So far as the ground of judgment was concerned he was unable to agree

with the Dean of Guild. But the only result of that was that one must look at the merits. The objectors said there was no possibility here of a dispensation because section 60 only dealt with buildings which were in a street, and this was not a building which was in a street, it was a building which was in streets—the plural instead of the singular—and that was regulated by section 62. His Lordship thought that was a completely erroneous view of the statute. It was perfectly clear that section 62 was not a code in its dealing with streets in the plural, whereas section 60 was a code dealing with streets in the singular. Having settled that there was a little doubt thrown upon the matter whether the consent of the Corporation had been here given, because the application bore to be for a building in West George Street, and not for a building in West Regent Street Lane, it was not too much to assume that the Corporation knew the circumstances of West Regent Street Lane, but his Lordship did not care to decide that question here, and what he proposed was that with the explanations of law which he had given the question should go back to the Dean of Guild in order that he might consider whether as a matter of fact the consent of the Corporation had been knowingly given to a building which, under section 62, must be held as abutting upon two streets. If that consent had been given and the Dean of Guild saw no reason to interfere then all was right. If that consent had not been given then, of course, the Dean of Guild in his turn would send it back to the Corporation.

Lord Dundas concurred.

Lord Johnston, while concurring in the course proposed to be taken, differed on the grounds upon which their lordships ought to proceed, his view being that the sections of the Act referred to related to the case of a main street and a side street, and not to two parallel streets as West George Street and West Regent Street Lane were. It seemed to him that the code in the sections was not complete, and he had very great difficulty in applying it to the present case.

#### SOUTH LONDON SCHOOL OF TECHNICAL ART.

PERHAPS the best indication of the continued usefulness of the modelling department of this school and its great influence on the art of sculpture in England may be found in the results of the annual competition for the Institute's Sculpture Studentship of 50%, and in the public work recently executed by its students of past years.

The studentship is only open to competition to students of the school who have attended the modelling classes regularly for three years and have contributed at least three designs to the sketch club during the year. It has the effect of attracting to the school many earnest young carvers, and of encouraging them to prosecute their art studies diligently and continuously over a period of at least three years, and in several instances over a still longer period. The subject set for competition is announced every year before the long vacation, together with the scale to which the model must be worked (usually about one-third). The models submitted are in clay or a plaster cast from it, and they are the original work of the students both in design and workmanship. The students of the school who are eligible to compete for this studentship have, therefore, about six months in which to study the subject for the year, to sketch out a design and to work out a model on a sufficiently large scale, usually from 3 to 4 feet high. In all this they are expected to depend solely upon their own abilities, unaided by their teachers. The subject of the competition is invariably a piece of architectural sculpture; last year it was a design for a doorway with metal doors for a national bank. The competition was judged by Mr. Pomeroy, A.R.A., himself one of the distinguished past students of the school. The models submitted were, if possible, somewhat above the average, both in originality and beauty of design and in workmanship, indicating that careful thought and observation had been bestowed upon them. The studentship was awarded to Philip Allen, and "Honourable Mention" to P. B. Baker and W. W. Wagstaff.

The new buildings of the Victoria and Albert Museum at South Kensington are nearing completion, and contain much external sculptured work, a great part of which has been executed by past students of the Institute's school. The sculptured panels over the principal entrance have been carved by Mr. Frampton, R.A., and eight of the statues along the front of the building have been executed by Mr. Goscombe John, A.R.A., Mr. Lynn Jenkins, Mr. A. Broad-

bent and Mr. W. S. Frith, the teacher of modelling under whom all the previously named sculptors had studied at the Institute's school. Again, two of the past distinguished students of the school have been engaged on the sculpture at the new Central Criminal Court in the Old Bailey, Mr. Pomeroy, A.R.A., and Mr. Alfred Turner. And nearly a quarter of the exhibits in sculpture at the last Royal Academy exhibition were by artists who had attended the modelling department of the Institute's school.

The drawing and painting classes have been well attended during the year, and the teacher reports that the work has been fully up to the high average of previous years. The majority of students attending this department are illustrators and designers by occupation, but many of them have risen to considerable success at the Royal Academy schools and exhibitions. To these must now be added Mr. Frank Craig, whose picture, "The Heretic," was purchased last year under the "Chantry" bequest.

The number of students attending the school during the session was 131, as against 137 in the previous session. The attendance fluctuates by reason of the nature of the occupations of the students. They are nearly all carvers or draughtsmen or decorators, and their work frequently carries them considerable distances from their homes or lodgings, sometimes for weeks or months at a stretch. As an example of this a recent case may be cited in which the committee granted an extension of time to one of the holders of the sculpture studentship who had been unable to make the required number of attendances at the school, having been engaged for over two months on some carving-work at Oxford.

### SARSEN STONES.

AN appeal has been issued by the National Trust for Places of Historic Interest or Natural Beauty in favour of protection for stones locally known as "Sarsen stones." They are, geologically, the hardened and solidified boulders of a stratum of Eocene sand formerly covering the chalk, which in the course of ages has been denuded of the softer portions. These Sarsens vary in size from small boulders to vast masses of sixty or seventy tons. They are found as scattered blocks over a wide area of the chalk country, but in the neighbourhood of Marlborough are in several places congregated together in such vast assemblages, following the windings of a narrow combe or "bottom" of the Downs, as to suggest the idea of a river of stones. Two of the most remarkable of these assemblages are those to be found in Lockeridge Dean and Pickle Dean; the latter collection, from the fact that the narrow valley containing the stones is actually crossed by the Bath Road some four miles west of Marlborough, has been known ever since the old coaching days more particularly as the valley of the "Grey Wethers," from the resemblance of the stones in the distance to a flock of sheep. Lockeridge Dean lies rather to the south, and in spite of much destruction of the stones in past days, still contains perhaps the largest Sarsens now to be found *in situ* anywhere. It was from this neighbourhood, perhaps from this spot, that the great Sarsen monoliths of Stonehenge doubtless came (for Sarsens do not now exist, and never could have existed in any number, on Salisbury Plain), as well as those of the Avebury circles near at hand.

For many generations these stones, scattered widely over the Downs, have been broken up and used for building and other purposes, mainly of a local character, but the "quarrying" (if the term is permissible) has not been on such a scale as to make any appreciable difference in the appearance of the Downs. In consequence of a recent change of ownership, however, there is every probability that the work of breaking-up the Sarsens will be undertaken on a greatly extended scale. In the ordinary course, the Grey Wethers in Pickle Dean and Lockeridge Dean would be the first to go, owing to their situation adjacent to high roads; while for the same reason their disappearance would be a greater loss to the public than the disappearance of those in more remote parts of the Downs.

Under these circumstances it was felt that steps ought to be taken to secure the preservation of some characteristic examples of the stones in their natural condition, and representations were made to the owner by the National Trust and by the Wiltshire Archaeological Society. Mr. Alec Taylor, the present owner, met the representatives of the two societies in a friendly spirit. He stated at once that he intended to preserve the dolmen known as the

Devil's Den, and after some further negotiations he has given the National Trust an option to purchase about 11 acres in Pickle Dean and about 9 acres in Lockeridge Dean for 500*l*.

For this sum, therefore, with some addition to cover legal and other necessary expenditure, an appeal is made jointly by the two societies. If the money is forthcoming characteristic examples of a unique geological phenomenon will be secured for the nation, and the Pickle Dean valley will remain in possession of those Grey Wethers which have for generations formed a curious and picturesque feature of the country traversed by the Bath Road.

### SOCIETY OF ARTS.

THE annual report of the Society of Arts says of the applied art section:—The first meeting of the section was held on December 18, when an instructive paper on "Basket Making" was read by Mr. Thomas Okey, who (himself a practical basket maker) was able to describe fully the technical points connected with one of the oldest of the arts. So little have these changed that the same "strokes" found in the oldest baskets discovered in the ancient Egyptian tombs are in use at the present time.

At the next meeting, on January 29, Mr. William Dale read an interesting paper on "The Artistic Treatment of the Exterior of the Pianoforte," in which he described some of the most remarkable examples of ornamental harpsichords and pianos, paying special attention to the beautiful modern instruments designed by Sir Lawrence Alma-Tadema, R.A., Sir Edward Burne-Jones and the chairman (Mr. T. G. Jackson, R.A.). Mr. Dale pointed out that improvements might be made in the form and decoration of the ordinary upright pianoforte without any great increase in its price. In the discussion attention was directed to the sound principle that the form of the case, however altered, should always follow the main lines of the instrument.

Dr. A. P. Laurie's important paper read at the third meeting, "Oils, Varnishes and Mediums used in the Painting of Pictures," was a complement to Professor J. M. Thomson's paper on "Artists' Pigments," read last session. The author described his original experiments on this subject, and illustrated his paper with a valuable series of micro-photographs. Sir Luke Fildes, R.A., presided at the meeting, and in the discussion the hope was expressed by the artists present that the further experiments on which Dr. Laurie was engaged would throw more light on the actual cause of the cracking of pictures.

Mr. A. Romney Green's paper on "Joinery and Furniture Making," read on April 16, contained a history of the art of joinery and a demonstration of the superiority of the older furniture by reason of the use in its construction of simpler tools than those afterwards introduced. The author drew special attention to the importance of the proper cutting of timber for the production of sound planks. The paper was illustrated by examples of old furniture from the Victoria and Albert Museum, lent by the Board of Education.

Mr. William Burton's paper on "Lustre Pottery" consisted of a brilliant exposition of the history of the changes in character of lustre from its origin, and the advances which had been made in the manufacture, especially in the case of the beautiful ware with its remarkable iridescence now made by Pilkington's Tile and Pottery Company. A singularly fine collection of historical and modern pieces from the Victoria and Albert Museum and many other contributors was exhibited.

At the last meeting of the session, on May 28, Mr. Sherard Cowper-Coles read an interesting paper on "Sheffield Plate and Electro-Plate," in which he traced the history of plating in metal from its practice before the introduction of Sheffield plate, which itself has been superseded by electro-plate. The chairman (Sir John Edward Bingham), from his great experience of the subject, was able to supplement the information given in the paper, and an important discussion was the result.

In the third course of Cantor Lectures, Mr. F. Hamilton Jackson dealt with "Romanesque Ornament," and to this subject he devoted three lectures. The course was in fact a comprehensive treatment of a large and difficult subject. The lectures were illustrated by a beautiful and original series of lantern slides of specimens of ornament taken from buildings in all parts of Europe. The author described the cloister as the cradle of Romanesque, and referred to the universality of the appearance of similar designs in the

various arts of architecture, miniature painting, textiles, ivory carving, &c. He laid special stress on the Oriental influence exerted on ornament in France and Italy. These lectures, as containing original examples of a great variety of Romanesque ornament, will help students to a clearer understanding of some of the difficulties presented in the history of this subject.

### CONCRETE ROOFS FOR INDIA.

A VERY useful and interesting note on the problem of roofs in the United Provinces of India has been written by Mr. H. S. Wildeblood, superintending engineer, at present Under-Secretary to the Government of India in the P.W.D. The question of the best form of roof for the plains of India, says the *Indian Engineer*, has lately been engaging the attention of the engineers of these provinces; and though the matter is still more or less at an experimental stage, certain definite conclusions have been arrived at, and the object of the note is, the writer says, to help junior officers who are interested in the subject, and who are willing to profit from experiments carried out by their predecessors without waste of time in traversing old ground. The writer also expresses the hope that it may lead to an exchange of ideas on this and kindred subjects, which would be of interest to the Consulting Architect to the Government of India and to others who are making a study of the improvement of house-building in India, though Mr. Wildeblood's note deals only with one small part of the larger question.

The writer briefly traces the history of the various forms of roof in use from the last century and of the attempts made to effect improvements in this direction. The serious disadvantages, not the least of which is its high cost, of the "jack arch" roof, perhaps the most permanent form of roof construction known till recently, are very clearly brought out. The writer then goes on to explain that the introduction in Europe and America of reinforced concrete gave engineers in India the idea of improving their roofs by means of this most useful form of construction. The experiments which have been carried out and which are described in the note have been attended by the most satisfactory results, and show that the reinforced concrete roof is by far and away the best in every way. It was found that with 40 parts of the ordinary pure kankar lime mortar of the plains and 100 parts of brick ballast, broken to a gauge of 1 inch, a concrete roof 8 inches thick, with seven strand wires running through it at intervals of a foot, and having a span of 6 feet between joists, was capable of bearing distributed loads of over 900 lbs. to the square foot. Larger spans, which are no doubt possible, are now being tried. Roofs made thus of reinforced concrete proved cheaper than those of jack arches, and flat ceilings can easily be given to the rooms by merely plastering the lower surface of the concrete slabs, while expansion joints, which are necessary to prevent irregular cracking, can very easily be arranged for. The concrete roof has also been proved to be infinitely cooler than the jack arch or any other form of roof in use in India.

For verandahs, where the chief function of the roof is to shade the walls of the main building at a minimum of cost, the light sloping roof of "lock" tiles laid on angle steel battens resting on steel joist rafters and light stone, or, where stone is too expensive, cast-iron columns is recommended.

### GENERAL.

**Admirers of the Works** of the great artist, Thomas Gainsborough, desire to erect a statue to his memory in the town in which he was born, Sudbury, Suffolk. A public meeting is therefore being held to promote this object at the town hall, Sudbury, to-day, the 19th inst.

**The Church** of Notre-Dame des Champs, near the Mont Parnasse railway station in Paris, is about to be removed in order to obtain a site for a post office.

**An Equestrian Portrait** of the Emperor Nicholas I. of Russia was lately stolen from the National Gallery of Berlin, but it has been returned to the director by parcel post.

**The West Front** of York Minster was cleared from scaffolding last week after a restoration under the direction of Mr. G. F. Bodley, R.A., which has been carried on during more than seven years.

**Messrs. Arthur & Walter Reid**, with Mr. Hubert S. East, architects and surveyors, of Cape Town and Johannesburg, have opened London offices at 837 Salisbury House, London Wall, E.C.

**The Late M. Dejean**, an architect, bequeathed twelve fountains to the city of Paris. The first was inaugurated on Sunday morning on the Boulevard des Filles-du-Calvaire.

**Mr. E. B. Martin**, deputy city engineer, Leeds, was on Tuesday appointed borough engineer for Rotherham at a salary of 500*l.* a year. There were 116 applicants, who were subsequently reduced to three—Mr. W. H. Elce, borough and water engineer, Bacup; Mr. Ernest B. Martin; and Mr. E. S. Pinkerton, chief assistant engineer, Belfast.

**The Purchasers** of the late church of St. Peter-le-Poer, Old Broad Street, E.C., for which Messrs. St. Quintin & Son successfully bid 96,000*l.* on their behalf at the recent auction, are the directors of the Anglo-South American Bank, of Bishopsgate Street. They propose to erect a handsome building on the site.

**The Birmingham Museum** and School of Art sub-committee have been informed that the trustees of the Griffiths Fund had presented a water-colour drawing by John Ruskin of Dumbarton Castle, and that Miss McGhee had presented a fine series of mezzotints and etchings by Frank Short, J. M. Whistler, Joseph Pennell, J. C. Watson and others.

**At Last Week's Meeting** of the London County Council Mr. J. Todd was appointed the district surveyor for the City of London, East, and Mr. C. W. Surrey for the City of London, West.

**The Court of Common Council** have adopted a report by the City lands committee which, among other things, recommended that a further section of the electrical rewiring of Guildhall should be proceeded with during the forthcoming recess, at a cost not exceeding 500*l.* (provided for in the estimates). They also asked for authority to expend a sum not exceeding 294*l.* on the construction of a new staircase on the south side of Guildhall, connecting the great hall with the crypt, and on other works to improve the service on occasions of public entertainments; and further recommended that certain structural alterations should be made to improve the service between the Guildhall Club kitchen and the luncheon-room, and that the service lift should be fitted with electric power at a total cost of 200*l.*

**At the Lord Mayor's Court** last week (before Sir F. Bosanquet, K.C., Common Serjeant, and a jury), Mr. George Stephenson, architect and surveyor, sued Mr. Thomas Satchwell, broker, for 26*l.* 5*s.* for professional services rendered. The plaintiff said that in 1902 the defendant requested his services for the purpose of obtaining a loan to enable certain shops to be erected on a building site at Wimbledon. The fees for the work he was required to do were agreed at 20 guineas. The defendant never carried through the building operations, but entered into a contract to sell his interest. The balance of the claim, 5 guineas, was in respect of a site at Tower Hill, which he had inspected on behalf of the defendant. The charges were fair and reasonable. The defendant stated that he had never retained the plaintiff. He was to survey the property on behalf of the person financing the builder and to receive his fees from the advances made. The defendant did not give evidence and the jury found a verdict for the plaintiff for the amount claimed, with costs.

**The South-Western** centre of the Sanitary Inspectors' Association will hold a meeting at Weymouth on the 20th inst. Mr. T. J. Moss-Flower will read a paper in the Guildhall entitled "Some Notes on Practical Sanitary Science, with special reference to Seaside Resorts."

**In the House of Commons** the Vice-President of the Board of Agriculture (Ireland) was asked whether the attention of his department had been directed to the wholesale clearances of ornamental and useful timber being carried out by landowners (mainly absentee) throughout the country; whether steps would be taken to check them, and whether the time had come when a scheme of reafforestation might be favourably considered and given practical effect to. Mr. T. W. Russell replied in the affirmative and stated that both landlords and tenants are cutting down timber in many parts of the country. The area under wood in 1895 was 308,928 acres. In 1905 it was 301,132, a decrease of 7,796 acres, and there is reason for believing that the rate has increased rather than decreased since 1905. Having consulted with the Chief Secretary, I propose to appoint a small departmental committee, not to consider the utility of afforestation, but to devise a scheme whereby, first, the mischief now going on may be checked, and, second, the best means of approaching the larger question of afforestation may be ascertained.

## THE WEEK.

IN the case of *EDEN v. North-Eastern Railway Co.* the House of Lords has decided a point of some importance to the owners and lessees of mines. The point arises upon the construction of section 78 of the Railway Clauses Act 1845. Under that section a railway company may require the owner of minerals lying under or adjacent to a railway to leave the minerals unworked, paying compensation. This, it has now been decided, means that the company must pay the full value of the minerals thus left unworked. The company cannot argue that, because the lessee of the mines is able during the period of his lease to work minerals in other parts of his mines, it is therefore only liable to pay the lessee for the difference in expense between working the minerals which it has taken and the substituted minerals, together with a sum to the lessor as compensation for the deterioration in the value of his reversion. The Act means that the company must pay down at once the value of the minerals upon which it places an embargo. If the mines are leased, the owner and lessee will get this value according to their several interests. The fact that the lessee may thus get "a windfall" by being able to work other parts of the mine with the machinery so set free is immaterial. But though, as against the railway company, who are under a statutory duty to pay, this matters nothing, it is conceivable that it might in some cases raise complicated questions between lessor and lessee as to the apportionment of the money so paid.

THE public works committee of the Birmingham Corporation recently formulated an important scheme for the improvement of the city. It provided for the extension of Paradise Street by cutting a new street through the Old Wharf, terminating between Berkley Street and Gas Street, a new wharf being provided in the Crescent on land to be acquired from the Governors of King Edward's School, at a total cost of 261,835*l.* In these days, when motor-cars are everywhere, Paradise Street has become a risky place; but apart from that evil the Old Wharf is an example of antiquity which fails to win respect, for not even archæologists would suffer by its removal. It is simply an anomaly in so progressive a city. The subject has been discussed with the customary earnestness of Birmingham men during several months. When it came before the City Council last week the members were aware of the state of public opinion. Birmingham is economical, and is not disposed to expend money on improvements which, with a little inconvenience, can be postponed to a more fortunate time. To the surprise of the promoters there were only eighteen votes in favour of the project, while the opponents numbered forty.

A RATHER novel action was decided in the Court of Appeal last week. It was brought by the lessee of a restaurant against the Marylebone authorities, and it arose out of the erection of workmen's dwellings adjoining the plaintiff's property. It became necessary to increase the height of the party wall between the premises, and in doing so it was alleged that the plaintiff's business suffered. The surveyors to whom the differences between the parties were submitted decided that the Borough Council should perform certain works for plaintiff's benefit. But as the Building Act only mentions payment of costs in obtaining the award, plaintiff brought an action to obtain compensation. In the Divisional Court it was decided that the surveyors were right in declaring they had no jurisdiction to award compensation. The plaintiff therefore appealed. Reliance was placed on sub-section 6, which declares that a building owner should have "a right to raise and

underpin any party structure permitted by this Act to be raised or underpinned, or any external wall built against such party structure, upon condition of making good all damage occasioned thereby to the adjoining premises, or to the internal finishings and decorations thereof, and of carrying up to the requisite height all flues and chimney-stacks belonging to the adjoining owner on or against such party structure or external wall." But it was argued that the first sub-section allowed the surveyors to deal with any other matter arising out of or incidental to the difference. Lord Justice VAUGHAN WILLIAMS, in his judgment, said that in section 87 the word "compensation" was used, and the amount was to be fixed by the surveyors who formed a tribunal. But damage appeared to be confined to walls, finishings and decorations, and did not include damage to trade. Such a claim as plaintiff set forth was beyond the jurisdiction of the surveyors. Lord Justice FLETCHER MOULTON and Lord Justice BUCKLEY having arrived at a similar conclusion, the appeal was dismissed. The London Building Act is far from being a perfect Act. But it was not likely that one or three surveyors should be considered qualified to adjudicate on matters relating to business of which they could have no special knowledge. The Court of Appeal had already decided that the surveyors had no power to award the payment of money for an increased use of a party wall.

THE Scottish Courts apparently are more disposed to recognise vested interests in houses as affording a claim to prevent the erection of other buildings which would interfere with their character. It was proposed to erect in Kelvinside Gardens, Glasgow, houses which would be arranged in tenements. Two of the residents in the place objected when the plans were submitted to the Dean of Guild Court for approval. They based their opposition on the condition imposed when the property was originally laid out, that villas only were to be erected. The Dean of Guild said it was too late to object, as similar buildings to those proposed were allowed to be erected without any protest. An appeal was made to the Court of Session. The Lord President set aside the decision of the Dean of Guild on the ground that the objectors did not forfeit their right by neglecting to exercise it on a previous occasion. It would require very explicit clauses in English deeds for a judge to interfere with a building scheme unless it was of an extraordinary character.

It will be interesting to discover what effect the union of Bruges with the sea will have upon the fortunes of the old city. At the present time most of the people appear to an English visitor as if they lived upon the alms which were bequeathed by wealthy citizens in the days when Bruges was prosperous. It resembles Sandwich on a large scale, and if grass does not grow in the principal streets it would not be difficult to grow weeds in any part. At the beginning of the fourteenth century Bruges contained a larger population than Paris, and every third man was a workman. In the fifteenth century it is recorded that 150 vessels entered the basins in one day. But the sea has its whims, and in Bruges as at Southport it receded, regardless of the loss which was to follow. A century ago NAPOLEON desired to restore prosperity to Bruges and to inflict a blow upon England by connecting the city with the sea. But it was not until 1877 that a definite plan was proposed. Many years were spent in opposing and supporting the details, and after a long struggle in 1892 the Government adopted the plans of two Frenchmen, M. COISEAU and M. COUSIN. The people of Antwerp and Ostend used all their influence to cause more delay. But at length it is possible to pass from Zeebrugge between Blankenberghe and Heyst to Bruges by water. Whether the gain will not be counterbalanced by loss to other parts of Belgium is a question which time will have to decide.

## UNDERGROUND WATER SUPPLY.

THE presidential address by Mr. BALDWIN LATHAM, which appears in the "Journal of the Institute of Sanitary Engineers," suggests that people are not generally acquainted with the risks which they sometimes incur when they depend on a subterranean water supply. It is not to be assumed that danger necessarily accompanies the use of water from such sources. But in a country like England, where the greater part of the land is inhabited, the conditions are not the same as those which prevail in places where there is no danger of contamination. Formerly much of the water which was everywhere used came from below. Old BURTON considered that rain-water was the purest, especially when the drops were small and it was used immediately. Next to it, he says, is fountain-water that rises in the east and runs eastward from a spring in flinty, chalky, gravelly grounds. Many, he adds, "make use of deep wells, as of old in the Holy Land, lakes, cisterns, when they cannot be better provided." He goes on to say, "Howsoever, pure water is best and which (as PINDAR holds) is better than gold; an especial ornament it is and very commodious to a city (according to VEGETIUS) when fresh springs are included within the walls, as at Corinth, in the midst of a town almost, there was *arx altissima scatens fontibus*, a goodly mount full of freshwater springs; if nature afford them not, they must be had by art." When we consider the consequences of drinking fouled water we can appreciate the reasons for endowing pure water with a religious character, in the hope that what the gods had sent men would be careful to preserve from whatever was likely to sully it.

It requires very little observation or reflection in order to realise the extent of the impurities which must descend with rain beneath the surface of the ground. Water is said to be sometimes hard, sometimes alkaline, sometimes organically impure—all of which is owing mainly to foreign matter which has been dissolved by it and continues with it. It seems incredible that on one occasion water from a London well was ascertained to have 148 grains of solid matter to the gallon, and a large part consisted of nitrate of lime. In other cases lead was found in the water in the neighbourhood of London, and much else which at first sight appears to be extraordinary. How far they were dangerous to those who drink the water was a disputed question. The late Sir WILLIAM FERGUSSON, the surgeon, maintained that a man might drink the water from below London Bridge with impunity. But few medical officers of health would now be found to agree with him. There may be saving advantages in the disturbances to which water in the Thames is subjected, and the atmosphere, with all its defects, may neutralise some of the evils. But too many cases have been investigated to leave any doubt about the belief that unless wells are properly sunk in safe positions the water is not always innocuous. Mr. LATHAM puts the case plainly when he says:—

"The use of water from surface wells in towns and populous places should be prohibited owing to the multiplication of sources of pollution, which it is impossible to avoid in all cases so as to get a safe water for dietetic purposes. There is no doubt that good water is procurable from the great geological formations of the chalk, red sandstone and oolites in this country; but even these sources of supply are all liable to pollution of a dangerous character if the site selected for procuring the water is not located in a favourable situation."

Matter which is an undesirable constituent of water easily sinks from above in a more or less vertical line, or, if the course is more clear of obstruction, it may be along the lines of the strata. But the water is liable to be attacked in other directions. Mr. LATHAM refers to an incident at Lausen, near Basle, where the morbid matter of typhoid was carried a distance of a mile or more through a hill to a village on the opposite side of the hill. Tests were arranged which demonstrated beyond all doubt the possibility of such a contagion.

Parts of the Metropolis are not free from similar risks. The effluent from the Croydon sewage farm at Beddington escapes through the beds into what are known as the Thanet Sands underneath, and it appears that from those beds some of the underground wells in the neighbourhood of London are supplied. They are not the only sources of danger which surround us.

It would be absurd to imagine that whenever an underground source is utilised danger is inevitable. Generally speaking, the water by sinking to a considerable depth has gone through a very elaborate process of filtration. It often is possible to bring water into the domestic cistern in as pure a condition as can be desired. According to Mr. LATHAM, "In single, isolated houses, by observing the direction of the underground flow of water we may always select a site for a well that shall be in the up-stream side of the flow, and the cesspool may be placed with impunity on the lower side of the well. In the course of the author's experience he has known houses very unhealthy that have been made healthy by moving the well from one side of the house to the opposite side, and so escaping the impurities from the cesspool passing into the well; and in one case—at the workhouse at St. Ives, Huntingdon—he was able to stop an outbreak of typhoid fever by driving a tube-well, from which a pure-water supply was obtained, in lieu of the supply procured from a well sunk in the midst of drains." The change that can take place in the quality of water along the line of delivery has been shown by an analysis of the supply for Caterham. In one place the proportion of nitrates was .027 parts in 100,000, while elsewhere it was .551 parts in 100,000, or twenty-six times as much. So great a difference is enough to demonstrate the variability which can arise and which should be reckoned on in arranging a supply. Nitrates, we need not say, are always risky constituents of water.

It is no doubt desirable to have water under observation from its first catchment basin until it passes into the reservoirs. In that way most of the dangers can be carefully watched and provided against. But it is readier and more economical to utilise for small supplies underground waters. If the town which has to depend on such a supply is large the outlay cannot fail to be expensive, for it may be necessary to form horizontal conduits also. But for villages and detached houses in the country there can be no question that a well is a great advantage, and by the exercise of good judgment risks may become infinitesimal. Cases have been known where the underground supply has been diminished in quantity and the quality has been altered. But, in spite of such possible if remote contingencies, it is doubtful whether springs and wells can be superseded.

It is necessary, however, to take a broad view of the subject. It may be possible to discover a supply with no more aid from science than a couple of hazel twigs. But that is not sufficient. There can be an abundance of water, and apparently it may possess all the characteristics of a potable water. Yet, although it is sparkling to the eye and agreeable to the taste, danger to the user may be lurking within it. The geological conditions which affect the beds from which it was derived must be carefully taken into account. The old inhabitants of the country were in this respect practical geologists. The positions of villages were often determined by facilities for obtaining water, and, if PRESTWICH is credited, London itself was no exception. Where there was gravel above London Clay it formed a natural reservoir, and water could be drawn from it. But houses could not be built upon the London Clay until JAMES I. passed the Act by which the "trunks," or wooden conduits, of the New River Company superseded the necessity for wells, when houses could be erected within the range of the company's supply. Where ordinary conditions prevail it is advisable to take pains in order to be assured that the water-bearing strata do not yield the elements of contagion.

It is not always easy to convince people that clear water can be dangerous to them. And they are no less sceptical about the fact that a peculiar flavour is evidence of the existence of foreign matters which to some extent are poisons. Hence it is they believe that a victory is gained when an abundance of water rises above the ground. But only those who have had special experience are able to judge how far all the conditions are favourable. We have known instances where the wells failed after a very brief period, and in some of them it was really an advantage than otherwise, for the supply was not adapted to use, and it was likely that the daily draughts of the water would sooner or later cause illness.

## THE ORIGIN OF OPERA IN FRANCE.

By Dr. JOHN E. BORLAND.

(Continued from page 38.)

OPERA in France, down to about 1750, was a distinct creation, notwithstanding all the external influences which played upon it. The early Italian influence, for example, acted as no more than a suggestion. Men who were interested in the entertainments of the Court said to themselves, "They have music drama in Italy, let us also have such spectacles, but in our own language and in our own manner." And thus it befell that the French Mascarade had more to do with the shaping of French opera into its ultimate form than had the Italian operas which Cardinal MAZARIN and his associates set out to imitate. The theory has been put forth that French opera had its origin in "l'épopée mise en action et en spectacle," and that "le merveilleux visible est l'âme de l'opéra français." In the earliest days the spectacle came first; next in importance was the plot, and quite in a subordinate position were held the claims or demands of solo vocalists to make personal display. In this last respect we find the most important point of difference between seventeenth-century opera in Italy and in France. In Italy, under the régime of SCARLATTI and his compeers, the vocalists were attaining more and more power, until in the eighteenth century an Italian opera was little more than a procession of opportunities for the display of vocal agility. During the same period there was practically nothing of this kind in France; definite airs were few in number, while on the other hand a fine level of elocutionary power was maintained in the continuous Recitative. The story of French opera is rather peculiar in another respect—its composers, with few exceptions, were entirely devoted to its cause and made little reputation outside its sphere. The exceptions, strangely enough, were men who also achieved something of a reputation in Church music. None of them had any lasting fame in the realms of secular absolute music—the exceptions to this statement being MARIN MARAIS, who is remembered rather for his solo music for viols than for his operas, and RAMEAU, whose works for the clavecin and researches in acoustics would by themselves have won him a niche in the temple of fame. Of the whole group of composers only two, LULLY and RAMEAU, have any existence in the mind of the average musical man of to-day, and even their personalities are but shadowy.

We have already seen that the true founders of French opera were CAMBERT and PERRIN, but it is quite possible, in the endeavour to do them justice, to err in the opposite direction and mete out to LULLY less than his due. There can be little doubt that he largely deserved the pedestal upon which popular imagination has placed him. While admitting that he gained his position by questionable means, it is necessary to admit, at the same time, that he could not have retained it without genuine musical ability and dramatic insight to back up his shrewdness. There is, moreover, a courtliness and dignity in his music, if not an actual

nobility, which command respect; and a measure of admiration is also surely due even to the less desirable aspects of his character. Cleverness, even in a rogue, still has its attraction, and LULLY certainly possessed this in a marked degree, or he could not have risen from his humble beginnings to the position he held during the last sixteen years of his life. His biography is too accessible to require noting at length here, and two facts suffice to prove his unbounded worldly success. He came from Italy as a poor boy, and he died one of the wealthiest and best hated of men in France. There is something even attractive about the cool impudence to which he owed so much of his advancement, and his relations with the king are well summed up in one little anecdote, which tells how a messenger came to him before the beginning of a performance to say that His Majesty had arrived and was waiting. LULLY's answer was:—"His Majesty is master here, and is perfectly free to wait as long as he likes."

LULLY's stage music offers a striking instance of the careful proportioning of means to an end. There is no wasted effort, and although on occasion he can rise to a height, this practical composer has no intention of spending labour to stay there at times when his achievement might pass unnoticed. We find this in his early ballet airs, which were never elaborated beyond the actual requirements of the dance, and the orchestral treatment of which was of the simplest character; and the same principle is maintained throughout the operas. These are cast in such a uniform mould that description is easy. The form of LULLY's Overtures is well known. They begin with a stately movement in chords, usually with a dotted rhythm. This is followed by a quicker movement of the Canzona type, but the imitative writing is of a curiously deceptive character. He keeps his string parts very busy, and the effect to a casual listener is that of fugal work; but closer examination shows that it is far from strict, and is as much a deception of the ear as painted scenery is of the eye; but it serves its purpose, and LULLY was not the man to use his best work merely to cover the noise of conversation and of late arrivals. Another slow movement follows the quick one and ushers in the prologue, in which mythological and other characters discuss in lively manner, with songs and dances interspersed, anything but the subject of the opera which is to follow. Then the overture is played again, as *entr'acte*—another example of economy of resources. The overture was probably not heard the first time, so it will do to play again, says the astute one. Then follows the first act of the piece proper. The libretto is completely set to music, and one of LULLY's merits is the way he seizes on important points and makes them stand out from less important surroundings. The supreme merit of all French opera, indeed, from CAMBERT to RAMEAU, is the continuity of the music. Whereas the Italians early forsook the dramatic ideals of MONTEVERDE, and made their operas mere occasions for the display of solo voices, to which were allotted strings of arias complete in themselves, and neither bearing any definite relationship to each other nor serving in any rational way towards the development of the plot, the dramatic instinct of the French people saved the national opera from that special form of degeneracy. Waves of Italian influence affected French opera from time to time, and LULLY himself was an Italian, but he became a naturalised Frenchman, and his operas only contain the Italian style of Aria at times in order to burlesque it and raise a laugh.

It is difficult to draw the line in the works of LULLY and his successors between Recitative proper and developed Aria. LULLY graded his music with such nicety and with such accurate fitting of the French language that in continuous scenes in which the vocal parts are ostensibly all in recitative style, he varies that style by imperceptible degrees, from the simplest monotone to completely articulated and balanced phrases, according to the importance of the words for the time

being. Of formal airs, apart from dance tunes, there are few, but such as there are show him to have had a fine ear for melodic outline and balance and an instinct for working up to a climax. The familiar "Bois Épais" in the opera "Amadis" (1684) is a good specimen of LULLY in his most serious and dignified mood. The funeral scene in "Alcécste" furnishes examples of a medium style, neither dry Recitative nor complete Aria. There is in this scene also a short but most impressive "Pompe Funèbre" for orchestra alone, full of fine discords similar to those familiar to us in the works of PURCELL. Another side of LULLY's versatile genius is shown in the "Air de Caron" in the same opera, where CHARON, the ferryman of the Styx, is made a *buffo* character, who haggles with the disembodied spirits over the fares for carrying them across the river, and is especially rude to one poor creature who has no money. This is a combination of Aria and Recitative, and the cynical remarks of the old curmudgeon are well contrasted with the pathetic appeals of the "Ombres."

LULLY and his followers employ the chorus in two ways. In the prologues and in some of the lighter scenes are choral dances such as the Gavotte and Minuet, sometimes accompanied by the orchestra and sometimes in alternate stanzas with it. The other employment is in a truer dramatic manner, where the chorus is the "crowd" and takes a share in the action, as in the Sacrificial scene in "Cadmus et Hermione" (1674). Here the chorus, singing antiphonally with the "Grand Sacrificateur," rises to a fine declamatory pitch. But the voices are never treated contrapuntally, solid masses of tone being entirely relied on for effect. It should be noted also that the voices are commonly in four parts, the present French custom of writing in three or six parts (soprano, tenor and bass) being more modern.

Besides the dances in which the chorus takes part these operas are full of other dance movements, including the Passacaille, Bourrée, Minuet, Gavotte, Loure, Canaries, Passepié, Rigaudon, la Forlana, Sarabande, several kinds of Branle; special dances for sailors, for savages, for soldiers and so forth; Gigue and Chaconne. All these dances with the exception of the last-named are very short, consisting usually of two divisions, and obviously they were to be repeated as many times as occasion required. The Chaconne nearly always occurs quite late in the opera, and was looked upon as a *pièce de résistance* to be saved for a final effect. The Chaconnes of LULLY and his imitators followed closely one model, being constructed on a "ground-bass" more or less freely varied, with modulations into related keys, and especially alternations from major to tonic minor and *vice versa*. The Chaconne persisted as a feature of French opera down to a late date, and it will be remembered that even GLUCK, a century later, had to give way to the importunities of the famous dancer VESTRIS and allow a Chaconne to be interpolated in "Iphigénie." Said GLUCK, "This opera is a tragedy of ancient Greece; it is impossible that it should contain a Chaconne." VESTRIS replied, "You should know that I am the god of the dance, and a Chaconne must therefore be included." "If you are the god of the dance," said GLUCK, "go and dance in heaven, not in my opera." But VESTRIS had his way.

It is no disparagement to the genius of LULLY to say that he was helped throughout his career by sheer good luck. The king's favour was the first and most important item in the catalogue of fortunate events, and this he was able to retain until his death. It was not merely his talents as a violinist nor his gifts as a composer which secured this; LOUIS XIV. was undoubtedly attracted by his general cleverness as a man and by his vivacity as an actor. In the last capacity, there is little doubt, LULLY might have made a noise in the world if he had had no other source of reputation. He not only provided music for the comedies of MOLIÈRE between 1664 and 1671, but also acted as stage-manager and filled several humorous parts in inimitable manner,

especially in "Le Bourgeois Gentilhomme" (1670) and in "M. de Pourceaugnac" (1669). With regard to the latter the story goes that LULLY, having temporarily incurred the displeasure of the king, played the title-rôle with such comic *abandon* that in the scene where he was surrounded by the apothecaries he jumped clean into the orchestra, and came to earth in the middle of the ruins of the harpsichord. The king nearly died of laughing and LULLY was restored to favour.

It was, of course, a piece of good fortune for the young musician to be associated both with the Court ballets and with the plays of MOLIÈRE; later, when he plunged into serious opera, he was equally lucky in having as an associate for the libretti PHILIPPE QUINAULT, a dramatist of real merit, and at one time said to be "the only European writer who has made the opera libretto a work of literature." Though very successful in his own comedies, his posthumous reputation rests entirely upon his long association with LULLY. He developed a remarkable facility for lyrical drama, his libretti in this field being among the very few which are readable apart from the music. QUINAULT hit the happy mean of retaining literary merit without overweighing the musician, and also showed a unique instinct for dramatic climax and for the full utilisation of the possibilities for effect offered both by the music and by stage machinery.

LULLY was fortunate also in having at his command, from 1673 to his death in 1687, a fully-equipped theatre, the death of MOLIÈRE in 1673 enabling the king to hand over to LULLY the theatre which until then had been occupied by MOLIÈRE, and which was fully stocked with all needful accessories, possessed a spacious stage, and was situated in the most brilliant part of the newer Paris of the day. LULLY's predecessors had not been so fortunate; PERRIN was obliged to hire the tennis-court of JEAN BÉQUET in the Rue de Vaugirard, where extensive and costly alterations were needed before "Pomone" could be produced. Through some trifling informality this house was closed by official order, and just then the quarrels began between PERRIN and his associates. This order was irrevocable, notwithstanding PERRIN's plea that he had been put to great cost and had been nearly ruined in making the necessary alterations. Another tennis-court was secured for the continuance of opera by PERRIN's associate SOURDÉAC, situated in what is now Rue Mazarin. Nothing is certain as to the architectural features of these places nor concerning the details affecting stage management. Reasoning, however, from customary laws of progress, it is not likely that these "Jeux de Paume" can have been particularly admirable in either respect. They served their purpose, however, and no doubt audiences accustomed to plays produced in ordinary halls or in the open air, with a minimum of stage accessories, were not very exacting in their demands. It is known that the second house had a stage opening of 30 feet. Some verses dated 1671 describe this house as possessing three tiers of boxes and a very commodious amphitheatre, from which all could see the stage well. The "parterre" was not yet in existence. It is possible to form an idea of the size of the house from the records of the Comédie Française, which occupied the premises from 1673 onwards. On great days they accommodated more than 200 persons in the second tier of boxes, and nearly 600 in the "parterre," for the comedians, addressing a different audience, had gradually reduced the amphitheatre of SOURDÉAC until it finally disappeared about 1681. MOLIÈRE's theatre in the Palais-Cardinal, afterwards the Palais-Royal, had also a stage opening of about 30 feet, and here it was that LULLY's most notable works saw the light.

In this case, again, much of the detail must be left to the imagination. There are pictures in the engraved full scores of LULLY's works which may or may not be quite reliable. Much is doubtless due to the artists' ideas of what might be rather than what was; but in the opera of France, where the spectacle meant so much, it

may be safely inferred that the productions were really on a scale of magnificence and dignity which would by no means be despised to-day. There is an engraving of a scene in "Le Ballet de la Princesse d'Élide" which was produced in the park at Versailles in 1664, before the Court. According to the picture, a handsome stage front had been erected at a point where a beautiful vista with the palace at the far extremity was revealed on the raising of the curtain. The orchestra, which seems to consist of forty or fifty players, is in front, but screened stage-high from the onlookers, who include the king and his party, in the centre facing the stage, flanked by a brilliant company on either side. Other pictures, in the scores of "Phaëton" and "Persée," give an idea (if they approach anywhere near to accuracy) of the problems propounded by the librettist for solution by the stage manager and machinist, and of the way they were carried out. JUPITER'S vengeance upon PHAËTON'S temerity, and the rescue of ANDROMEDA by PERSEUS, do equal credit to the stage management of the time and the skill of the artist, possibly not unassisted by some imagination on the part of the latter, as to which we are without information.

With two documents bearing upon the unique relations between LULLY and his patron we bring this part of the subject to a close. One is a typical dedication, taken from LULLY'S "Ballet du Temple de la Paix," produced in 1685. It runs thus:—

Sire,—Of all the works which I have produced, and which I have had the honour of offering to your Majesty, this is the one which most legitimately belongs to your Majesty. These new "Concerts" (Entertainments), Sire, are not only yours as the production of a genius which is entirely consecrated to you, but still more as it is a "Divertissement" arranged by a Prince of your Royal and August Blood, who at a time when the peace which you have established takes from him the opportunity of signalling his *valour*, occupies himself in preparing for you spectacles and fêtes which may cheer you amid the cares which you bear for the happiness of France. The Peace which your Majesty has so generously given to your enemies is the subject of this Ballet: Your Praises, Sire, form its chief part: the joy which the several Races there make vocal is caused by the blessings which they owe to you: everything in it speaks of your Glory; . . . I shall be too happy if your Majesty but judge this Ballet not unworthy of your pleasure, and receive it as a new mark of the very ardent and respectful passion which I shall experience throughout life.

Sire,

of Your Majesty,

The very humble, very obedient, and very faithful Servant and Subject,

LULLY.

The other is an extract from some letters patent granted by the king to LULLY'S son, insuring the copyright of his father's works for fifteen years beyond the thirty years granted to LULLY himself. The conditions seem ideal from the composer's point of view, and might form the basis of some legislation in England to-day. LULLY junior is allowed to print everything of his father's, viz. 19 operas, several ballets, Church music, &c., as detailed in a list appended. He is allowed

to sell them through all persons that may seem good to him in all places of our dominions, in such forms, characters, volumes and extracts as he pleases, during fifteen consecutive years . . . during which period we make very express inhibitions of all printers, copyists, engravers, librarians and booksellers and all other persons, that they neither print, sell nor distribute the said works . . . under forfeiture of the copies and of ten thousand livres for each offence, of which one-third shall go to the Hôtel Dieu of Paris, one-third to the informer, and one-third to the said Lully, besides all expenses, damages and interest.

Such words are calculated to make an English composer of the present day long for the beneficent government of an autocrat rather than that of a free constitution under which music pirates have so gay a time.

(To be concluded.)

## RESTORATION IN GERMANY.

OPINION was at one time so strongly in favour of the theory of Gothic and Germanic being alike that the Germans were perhaps justified in believing they were the inventors of Pointed architecture. The French, who should be proud of their connection with the early manifestation of the style, have allowed themselves, by their manner of considering it, to become supporters of the German view. For many reasons Gothic is well adapted to suit German peculiarities. Although it may be an evolution of Southern Romanesque, the style assumed Northern characteristics. There cannot be at heart much sympathy between the Northern and Latin races, and this can be expressed by the adoption of different architectural styles. It is true there are a great many buildings in Germany which may be described as Romanesque, but when they were erected the influence of the Empire continued to be irresistible in the arts, and German-born princes esteemed themselves as the successors of the CÆSARS.

It cannot be said that the peculiarities which differentiate German from French and English Gothic are always improvements. The German craftsmen, and the carvers especially, appear to have been allowed unusual independence, and they exercised it to an extent which suggests their indifference to unity or general effect. Many modern tourists can, however, find more pleasure in such examples than in the buildings as a whole, and we may suppose the contemporaries of the craftsmen resembled them. The porch, pulpit and clock in Strasbourg Cathedral seem to be the principal attractions for most visitors, and few believe there is any more to be seen in St. Lorenz, Nuremberg, besides the Sakramenthaus and one window. So long as the popular interest in a building is a reality it is of little consequence how the feeling arose, and in Germany even those who profess to be philosophic, and are indifferent to the use of Gothic churches, believe in the duty of conserving them. Hence we can so often see several old altars in a Lutheran church. They are useless, but it would be impolitic to remove them. The same affection is shown towards old secular buildings. The various controversies about Heidelberg Castle are evidence that not even imperial desires can interfere with public opinion when antiquity is supposed to be at stake.

At the present time there is some agitation in progress concerning ruins in the little town of Altena in Westphalia. They are parts of an old castle which are much frequented by the inhabitants of the town, and it has been proposed to add to their attractions by expending money on the restoration of the building and by introducing additions similar to those found in tavern gardens throughout Germany. Unimportant as Altena may appear to strangers, already influential bodies of restorers and anti-restorers are contesting about what is to be done and avoided in dealing with the old habitation of the rulers. In such cases there is always a danger of endeavouring to impart a world-wide interest to what is a simple affair, and in that way haziness is sure to follow, and the true conditions of the subject are overlooked.

The history of German restoration supplies many an example of the kind. Take Cologne Cathedral as an instance. ZWIRNER, the architect who was entrusted with the commission, proposed to erect a great central tower over the crossing. The walls were so slight it was evident such a structure was not originally contemplated. The Royal Technical Commission came to the conclusion that if the laws of statics were to be recognised as having influence the tower must be abandoned, as the substructure was inadequate. But ZWIRNER preferred to any statical law his belief that central towers were to be found in buildings erected about the same time, and therefore one should be found at Cologne. He was able to persuade the king to adopt his theory, and the strengthening of the piers was commenced. Common sense, however, prevailed, and a

catastrophe was avoided by the substitution of a *fleche* for a great tower on the four insignificant supports, and that addition does not increase the effect of the two flanking towers.

Idealism is so powerful with Germans, it becomes easy to imagine that an architect contemplated a different arrangement of materials from that he was compelled to carry out. The original intention is supposed to be evident to other idealists, and consequently a proposal like ZWIRNER'S is not uncommon. LESSING must have had the weakness of his countrymen in his mind's eye when he said:—"Not all that art can accomplish ought she to attempt. It is because we have lost sight of this principle that art among us has become more boundless and difficult, but less effective and perfect." But if ruins are regarded as if they were only slight indications of an architect's intention, their restoration may be said to offer unlimited opportunities for novel creations.

The anti-restorers at Altena are against such an interpretation. They rely on advice given by Professor GURLITT. He recommends when dealing with ruins to first remove rubbish which obscures the appearance of the buildings. If walls appear likely to fall supports should be employed, but of a kind which all can recognise as temporary auxiliaries. If any part which has fallen can be replaced it is wise to do so, but if there are doubts about the position the stones should be left. In other words, the conclusions of an individual are not always safe. Fine trees which are much older than a building he would respect, especially when they are in groups, but trees which conceal masonry or vegetation which is injurious to it should be removed. Exact drawings should be prepared, and restoration on paper is worth attempting. Descriptions which would inform a visitor are useful. It is also advantageous to collect models, old views, or documents which serve to illustrate the history of the place. If new buildings are required in the grounds, as at Altena, then they may be made to assimilate in style to the former appearance of the ancient remains, but care should be taken to make it plain to all that they are modern additions.

A great many buildings, and notably churches, which are now in use throughout Germany would be deserted if similar rules were always observed. Probably it was economy which dictated the vamping of new work with the old in them. But ruins can have their use. While Heidelberg Castle continues as we now see it, some of the horrors of war are suggested as forcibly as could be done by any sermon. If the buildings were repaired and used for Government offices they would become less eloquent, to rhymsters particularly. No doubt sobriety has been often exercised, but German churches at least make the visitor doubtful whether such an air of coldness could have prevailed in Mediæval times. The German notion of restoration does not correspond with that of French architects where renewal was allowed, but they have not yet attained the ideal limit which can satisfy the present without disturbing antiquity and depriving it of its characteristic qualities.

#### THE ROMAN VILLA AT PETERSFIELD.

ON Monday in last week a party of members of the Hampshire Field Club visited Stroud Green, about a mile out of Petersfield, to inspect the remains of the Roman villa in course of excavation by Mr. A. Moray Williams, B.A., whose work at the Roman villa at Lippen Wood, West Meon, has had such valuable results and has attracted much public attention. The excavation at Stroud has now reached an interesting stage, says the *Hampshire Advertiser*, and one wing of what must be a very large house has been laid completely bare. This wing contains about a dozen rooms, three of which were heated by hypocausts, and in one may be seen the rare feature of a wall still lined to an extent with large and unbroken flue tiles. Many of the floors are still well paved with tesserae. Several coins of the late Empire have been found, and various small finds of an interesting nature, including objects of iron, glass and

pottery. From the latter it has been possible to reconstruct almost completely a fine vase of New Forest or Sloden ware 12 inches high—a thumb-pot. The excavation, as it stands, covers an area of about half an acre, in which space, in addition to the wing already mentioned, two long walls of the courtyard have been laid bare, while more rooms and foundations are every day being brought to light. One long corridor has a mosaic pavement. The site is now open to the public, and will remain so probably until the end of August. Towards an estimated expenditure of 23*l.* the Society of Antiquaries has subscribed 5*l.*, and some other sums have been received which will enable the work to be carried on for a time, but the misfortune is that the site is in a cultivated field, that the farmer wants his land, and that unless some definite arrangements can soon be made for preservation the remains will be destroyed.

The villa lies a short mile west of Petersfield, one field back from the main Petersfield-Langrish-Winchester road. On arrival in the field, Mr. W. Dale, F.S.A., hon. secretary of the Club, introduced the visitors to Mr. Moray Williams, and then read a brief paper on the excavations, in the course of which he said:—

"We have journeyed a long way to see these foundations, but I think you will all admit when we have heard Mr. Moray Williams's explanation of them that we have not come so far for nothing. A new era in Roman research was begun in 1890, when the systematic investigation of the area within the walls of Silchester commenced. That work will be concluded this year, and I hope it will be possible for us to pay a final visit to the site. The Silchester excavations have taught us much more of the inner life of the Romano-British than we knew before, and have also taught other explorers wisdom in conducting kindred excavations. The examination of what was once thought unworthy of investigation has revealed to us what the Romans ate, the plants they cultivated, and what fruit and herbs grew wild where they lived, as well as some of the trades and industries at which they worked. We have also got a far better idea of the houses in which they lived, and have new data to guide us in realising what the superstructures of these houses were like. Nothing, I venture to think, is more interesting than this, and it is surprising how little we know about the dwellings of ancient races. The most interesting part of Professor Flinders Petrie's exhibition this year is that which bears upon this subject. He is able to show the plan of a house such as that which Joseph managed, and also to give an excellent idea of the dwellings of the ordinary Egyptians, by which we learn for the first time that the living-rooms were on the first floor and the bedrooms on the ground level. So, although we may not see here any very elaborate tessellated pavements, nor many of the pretty things such as at one time were the sole object of search, yet we have before us the ground-plan of a very fine house and its courtyard—the house in which a Roman colonist, who cultivated the farm and ground around it, lived, together with his servants and probably his slaves. Incidental evidence of his prosperity is given by the abundance of oyster-shells which have been found and the various kinds of pottery he used, some of which is our New Forest or Sloden ware, as well as in the usual arrangement of rooms for winter and summer use. May I be permitted to call your attention to the location of the house. Round about us are the grand chalk hills, covered with velvety turf, over which Kingsley went into raptures, and which Gilbert White called 'Vast Mountains.' The latter, living as he did when geology was an unborn science, spoke of the mighty force which had upheaved them like huge masses of dough under the influence of leaven. We now know that the power which moulded these hills came from without; the slow action of sub-aerial denudation continued through incalculably long periods of time. Where we stand is the fertile soil, made by the sands and clays of the greensand. All around us on the high ground is the chalk. We stand at the western end of the great area known as the Wealden. From Buster Hill the chalk extends right away to Beachy Head, cut through here and there by a river valley. The northern range of hills goes along from Guildford and Dorking to Dover, also interrupted by river valleys. These two ranges form the North and South Downs bounding the Wealden area. That great tract ends here in a semicircular sweep, the escarpment of which is not so marked as in other parts because the strata are not so much inclined. We believe that the chalk once extended right over the Weald, joining the North and South Downs together, and covering the place where we are to-day. Modern geology teaches us

that this dome of chalk has been removed solely by the long-continued action of water, and thus the softer beds below are exposed. This is the lesson we learn by a glance at the natural features of the country around us. I would like to remind the members that Mr. Moray Williams is responsible for the considerable financial outlay connected with this excavation. I have been able to procure a grant of 5% from the research fund of the Society of Antiquaries and some of our members have contributed already, but more money is needed." Mr. Dale added that the thumb-pot of Sloden ware was one of the largest he had ever seen. Mr. Moray Williams's excavations at Lippen Wood had been brought to a successful issue, and the results had been published by the Royal Archaeological Institute.

Mr. Moray Williams extended his hearty welcome to the visitors, and also his sympathy, for, he said, they had come very far to see comparatively little, and no sooner had they arrived than Mr. Dale began to suggest they should part with their money, but he hoped that as the result of their visit that afternoon they would come to the conclusion that in anything they did they were not rendering him personal assistance, but helping to continue the most interesting piece of work with which it was his good fortune to be connected, and helping to add evidence to the history of an obscure period. The Romans were in Britain for nearly 400 years, and systematic investigation had done much to make that period less obscure. The only way was to go on with the work quietly, not making a great fuss about their excavations, but taking care that the results were placed before the public in the smallest detail, for it was by details that they pieced together history. The house which stood there was built towards the end of the Roman occupation, and was a house of the late Empire. Evidence of this was furnished mainly by the coins found, of which they had some twelve specimens of, roughly speaking, the era of Constantine the Great. It was an age of toleration and peace, and it was small wonder that during such a period peaceful villa life flourished to the extent it did. The house was what was called a courtyard house, with a system of wings flanked by corridors. They had before them only one wing, but he believed from the great foundations that investigations would prove it to have been a very large house. He hoped they would not be disappointed at seeing so little mosaicwork, but that was the north-west part of the house, and he believed that more interesting remains would be found on the south side. The foundations were very close to the surface, and therefore it was not surprising that so little mosaicwork remained. The walls were very strongly built, not of stone found actually on the spot, but brought, as he believed, from about a mile away. Several refuse pits had been found, which had yielded some objects of interest, one of which was a piece of inscribed pottery, "Æ," but there was little of the inscription left. The greater portion of the soil removed had been put through the sieve, and had yielded the coins referred to. Trial trenches were still being made, and to show the solid character of the work done, he might mention that only on Saturday he was able to bring to light one of the most interesting parts of the villa, in the shape of a heated bath. He pointed to a chamber in which was a hypocaust where six whole box tiles had been found, three of which were in their original horizontal position.

Mr. Dale said that was a most interesting point. He had never seen box tiles laid horizontally at Silchester; they were always in an upright position there.

Mr. Williams said the tiles had "windows," so that the heat escaped in whatever position they were placed. The excavations were only in an initial stage, and he hoped to bring them to a conclusion next year. It was, however, discouraging work, for the farmer wanted to know when he could have his field as he wanted to use his pick and destroy the walls in order to make use of the land. It might be possible to rent the field for a year or two.

Mr. Lashmore said that renting the field would be of little service, as it would mean bringing to light much interesting work simply that it might be destroyed, though, of course, it would have historical value. What was really needed was an effort for permanent preservation, and the County Council had powers in that direction.

The visitors then inspected the excavations and the "finds," and then contributed among them nearly 2% to the excavation fund.

Mr. Dale, in proposing a vote of thanks to Mr. Moray Williams for having received the party, expressed deep regret that there was a probability of these interesting

remains being given over to the pick-axe. Mr. Lashmore's suggestion that representations should be made to the County Council was a good one. They all knew that Sir William Portal, who was vice-chairman of the Council and a past-president of the Society, took a great interest in the preservation of works of antiquity in the county.

The Rev. F. G. Wright, of Netley, seconded the motion, which was carried by acclamation, and Mr. Moray Williams, in reply, said he thanked them for their encouragement.

## THE CRYSTAL PALACE SCHOOL OF ART.

THAT the Crystal Palace has now become a great teaching centre, as well as a place of amusement, was strikingly manifest at the opening ceremony on Monday last of the exhibition of pictures by professors and students, past and present, of the School of Art, Music, Science and Literature, at the capacious and well-arranged studios in the south wing.

The proceedings commenced with the reading by Miss L. L. Roberson, principal of the school, of the art examiner's report as follows:—

"The examiner, Mr. Robert Harris (art master of the St. Paul's School) reports that the standard of the work in this school is above the level of that of the average art school. He considers that the following subjects should be specially encouraged:—1. Memory drawing from the antique. 2. The use of the sketch book. He recommends every student, whatever her capacity, to make a habit of note-book record, availing herself of the unusual opportunities afforded by the Crystal Palace for such study. He thinks that, although the design class is small, the average of the work is exceedingly good. The value of this class with its living model should be appreciated by the students, as in it is utilised the study made in other classes."

The distribution of art awards to the successful students was made by Captain Adrian Jones, who, in his preliminary address, advised the young students first of all to form an ideal, a motive, according to their inclinations, and in working it out the craftsmanship they learned at this school would carry them through.

A vote of thanks to Captain Adrian Jones for his services on the occasion was proposed by Mr. G. Starr, the general manager, and seconded by Mr. Matthew Webb, who reminded the audience that the group of "Duncan's Horses" and the recently erected Duke of Cambridge statue were the work of Captain Jones.

Among the large number of drawings on exhibition we may mention that there are several by Mr. S. J. Hodson, R.W.S., including two interior views of St. Bartholomew's Church, besides views of King's Gate, Winchester, Saumur, Verona, Toledo and the tomb of Emperor Maximilian. Nor should mention be omitted of the very fine representation in gesso of the daughter of the warrior Gileadite, Jephthah, by Mr. Matthew Webb. It may be added that the Fine Art Courts form the unique feature of the Senior School Art Section, of which Sir E. J. Poynter, P.R.A., is visitor, and in the Pompeian House, the Egyptian, Greek, Roman, Alhambra, Renaissance and other Courts students are presented in chronological sequence of styles with excellent examples of the various phases and developments through which the arts of architecture, sculpture and mural decoration have passed. The collection of statuary, too, is unique, and comprises copies of the best works by the old masters, besides reproductions of the most celebrated modern statues by well-known sculptors.

The War Office having called attention to a defect in the round tower at the south corner of the outer wall of York Castle, the question of the advisability or otherwise of demolishing this tower has arisen. The Prison Commissioners have inquired whether any historical and archaeological value is attached, locally, to this tower and the adjacent walls. In reply it was resolved by the Yorkshire county committee "that the Prison Commissioners be informed that the round tower at the south corner of the outer wall of York Castle and the adjacent walls have great historical and archaeological value, and that the Prison Commissioners be requested to remedy the defect in the round tower referred to in their letter with the least possible delay." The tower and the walls were built during the reign of King Edward I.

## NOTES AND COMMENTS.

BIRMINGHAM is fortunate in possessing many citizens who are distinguished for their public spirit. Among them is Alderman KENRICK, who has been connected with the City Council since 1870, and whose name is a household word in Birmingham. It is not for us to refer to all his public services, but it was in a large measure through his influence and exertions that art—and especially industrial art—was revived in the city. He has founded scholarships, and has induced several fellow-citizens to likewise aid the art schools. Among his gifts to the Art Gallery are the following pictures:—*Martyr of the XVI. Century*, by W. GEETS; *The Blind Girl*, by Sir J. E. MILLAIS; *Sweet Water Meadows of the West*, by J. W. NORTH; *The Portico of Octavia, Rome*, by SAMUEL PROUT; *The Birmingham Reference Library*, by E. R. TAYLOR. The purchase of the cartoons by Sir EDWARD BURNE-JONES, of *The Last Judgment*, and of drawings and designs by BURNE-JONES and ROSSETTI was inspired by Mr. KENRICK. He has also offered to give 5,000*l.* to the Picture Gallery Fund. A meeting was lately held to take measures for obtaining a portrait of Mr. KENRICK for presentation to the Art Gallery, and the proposal was unanimously adopted. It has been decided that the commission is to be given to Mr. JOHN LAVERY, R.S.A., and there is no doubt he will do justice to the subject.

THE appearance of the vacant land in the Strand is a satire of municipal ways, and no one should be surprised at the efforts which are made to dispose of it. Although one French syndicate was unable to carry out its arrangements, the London County Council on Tuesday accepted the proposal of M. ERNEST GERARD to take a lease of the central part at a rent of 55,000*l.* a year. It is proposed to erect a building which is estimated to cost 500,000*l.* Canada has shown remarkable enterprise in proposing to erect offices which would be in front of the French building at a cost of 400,000*l.*, and which will be designed by Messrs. A. MARSHALL MACKENZIE & SON, of Waterloo Place and Aberdeen. By that arrangement the French building will not be too obtrusive, for the Columbian building will front the Strand, with the church standing before it.

ANYONE who met THÉOBALD CHARTRAN would have considered there were many years before him. He suggested a vigorous athlete, and his success as a portraitist did not make him discontented with the world. He was one of the painters selected to adorn the Mairies of Paris, and at one time it might easily be imagined that he was destined to be a painter of ecclesiastical scenes on the walls of churches. Born in 1849 he entered CABANEL's studio in 1867, and ten years afterwards he won the Prix de Rome. M. NÉNOT, the architect of the Sorbonne, had predicted the success of his painting, and the two artists went to Rome together and in the course of their term travelled to Venice and Capri. He could not resist the temptation to become a portrait-painter, but it must have given him more pleasure when M. NÉNOT sought his co-operation to paint several of the panels in the Sorbonne. His work is also to be seen in the Hôtel de Ville of Paris, and in some of the Mairies. He was supposed to have been more a favourite of fortune when American ladies were fascinated by his portraits. He was paid liberally, and he made it a rule to visit the United States every year. When illness attacked him nobody believed it could be serious, and a voyage to Egypt was supposed to have restored him to health. But he gradually declined, and his death last week has caused almost dismay among French artists. He had to endure few trials, and until quite lately seemed to be little changed from the gay student who brought additional life into CABANEL's studio.

ACCORDING to the *Architects and Builders' Journal* of Baltimore a good illustration of the way in which coloured men of the present time are making their mark in the world is afforded in the career of W. SIDNEY PITTMAN, an architect of much prominence at the national capital. The United States Government accepted his design, offered in competition, for the negro building at the Jamestown Exposition. This is the first time a coloured man's plans have been accepted by the Government. PITTMAN's parents were formerly slaves. He was educated in the public schools in Montgomery, Ala., at Tuskegee Institute and at the Drexel Institute in Philadelphia, having been aided to take a course in architecture at the latter by BOOKER T. WASHINGTON. After graduating from the Drexel, PITTMAN took charge of the department of architecture at Tuskegee, where buildings costing 250,000*l.* were erected after his plans.

## ILLUSTRATIONS.

ECCLESIASTICAL COMMISSION BUILDING, GROSVENOR ROAD, WESTMINSTER.

ADDITIONS TO WICKHAM HALL, KENT: ENTRANCE FRONT.

THE additions to the above shown in our plate were carried out in 1892-4. A portion of the already existing house is represented on the right hand of the perspective view. On to this was built the projecting tower, to contain a main staircase and an upper smoking-room, and to carry on its summit a small observatory. Beyond this tower is the breakfast-room, with a bay window, and over it the boudoir. Next to that comes the schoolroom, with the butler's pantry on the ground floor beneath. To the left of these is a servants' staircase, housekeeper's room, servants' hall, &c. The drawing was made by the late Mr. A. E. PERKINS. The architect is Mr. W. MILLARD.

BURLEY CROFT, NEAR RINGWOOD: NEW EAST WING.

BURLEY CROFT, originally a four-roomed cottage with rooms under 8 feet in height, has been enlarged by successive alterations and twice by the present owner, Admiral PROTHERO, further additions having been made since the building last year of the east wing, shown in the illustration, a new staircase having been put in and the hall and west front extended. For the last two alterations Mr. W. E. ALEXANDER, of Ringwood, was the builder, and Mr. R. MACDONALD LUCAS, F.R.I.B.A., the architect.

ST. GEORGE'S CHURCH, FORDINGTON, DORCHESTER.

ST. GEORGE'S CHURCH, Fordington, is one of the most ancient, even if not the earliest, of the churches in England dedicated in honour of our national patron saint. Formerly it served for the inhabitants of a country village out in the fields just outside the walls of the ancient Roman city of Dorchester, Dorset. Now, owing to the sale of so large a part of the estates of the Duchy of Cornwall and of the Ecclesiastical Commissioners for building sites, the old parish of Fordington contains over 7,000 inhabitants, and old St. George's, so noted for its unique tympanum portraying St. GEORGE fighting for the Christians at the battle of Dorylaeum, July 1, 1097, is just being restored and enlarged by the energy of the present vicar, the Rev. R. GROSVENOR BARTELOT. The excellent perspective of the church as it will be, which we reproduce in this number, has been drawn by Mr. J. FEACEY, to whom modern Dorchester and Fordington owes so much for his originality and taste in the matter of Domestic architecture. The work is being carried out and will be completed in seven years from the seventh day of the seventh month of the seventh year of this century, when it was begun in accordance with the vicar's Biblical plan, and it will cost 7,770*l.*

## SOMERSET ARCHÆOLOGICAL SOCIETY.

AFTER a lapse of twenty-four years the Somerset Archæological Society held its annual meeting—the fifty-ninth in its history—at Shepton Mallet and district, and the visit to a locality of much interest to antiquarians was a most successful, pleasant and profitable character. The following account of the proceedings is derived from the ample report in the *Somerset County Gazette*:—

The proceedings commenced with the annual general meeting in the Council Hall at Shepton Mallet at noon. The Right Hon. Henry Hobhouse presided at the beginning of the meeting, and in introducing the new president (Mr. F. Somerville) remarked that the latter was no stranger to them. He could not conceive anybody better fitted by his position and public work to take the chair. It was most appropriate that he should succeed his uncle, Mr. Luttrell. Mr. Somerville would be able to tell them of all the attractions of that neighbourhood. It was more than twenty years since the Society met there last, and on that occasion they had the advantage of the presence of Mr. E. A. Freeman and a good many other members who had passed away. He could only hope that their places would be filled as time went on with worthy successors, and among them he was sure they would find no one who surpassed the president of this year. He proposed the election of Mr. Somerville as president.

The Dean of Wells seconded, and said that nobody knew at district so well as Mr. Somerville.

The Rev. F. W. Weaver then read the annual report, which stated that since the last report sixty new members have been added to the Society. The loss by deaths and resignations was thirty-nine. Altogether the net gain was twenty-one. The total membership of the society at date is 691. The total cost of vol. lii. (for 1906), including printing, illustrations and delivery, has been £13*l.* 16*s.* 10*d.* The thanks of the Society are due to Mr. Bligh Bond, F.R.I.B.A., the Rev. F. W. Weaver, F.S.A., Mr. Arthur Bulleid, F.S.A., and the Glastonbury Antiquarian Society, for their help in defraying the cost of some of the illustrations. Next year the Society celebrates its diamond jubilee. The committee are considering a scheme for annexing the apartments at present occupied by the curator for the purpose of the extension of the museum and library. One of the chief archæological discoveries in Somerset during the past year is the existence of a stone circle on Withypool Hill, Exmoor, not marked on the Ordnance sheets. It has been surveyed by Mr. H. St. George Gray. Previously in the county stone circles were represented only by the famous Stanton Drew group. It having been brought to the notice of the owner, Sir C. T. D. Bland, Bart., that the inscribed "Caractacus stone" on Winsford Hill, Exmoor, is rapidly becoming defaced, owing to weathering, he has promised to build a shelter for it on the spot. During May and a part of June the curator, jointly with Mr. A. Bulleid, completed the long series of excavations at the Glastonbury lake village. Structurally the excavations this year were of great interest, but the number of objects found hardly came up to the average. A large quarto work on the whole subject, copiously illustrated, is in preparation, but its appearance must be somewhat delayed owing to the illustrating and the enormous amount of detail such a record entails. Intending subscribers should communicate with Mr. Gray. The price will probably exceed a guinea, but it will be regulated according to the comprehensiveness of the book and the number of subscribers. A second grant of duplicate specimens from the lake village was made in 1906 by the excavation committee, both to the museum and to the British Museum.

Mr. Hobhouse, in moving the adoption of the report, said it was the most interesting statement ever submitted to the Society. It was perfectly clear that the money spent in the past on Taunton Castle and its collection was now being thoroughly appreciated, and the steady flow of donations and most valuable contributions of all kinds of archæological and other Somerset objects was most satisfactory. He was sure each addition to the museum would tend to attract more additions. The number of visitors needed to be increasing steadily, and he was sure more people would be induced to visit that most interesting place. He mentioned that the County Council had adopted the golden dragon of Wessex in its device. That had been the acting under the best advice of leading members of the Society, and he hoped none of the archæologists present would criticise that action of the County Council favourably, and he sincerely hoped that in taking that

step the Council would be supported by the general opinion of those most qualified to judge.

Mr. C. E. Burnell seconded, and said the officers were to be congratulated on the good work they had done, and he hoped they would get increased support from the county financially and otherwise, to render the Society more useful than at present.

*The President's Address.*

The President next delivered his address. He acknowledged the honour conferred on him, and remarked that June 6, 1907, would be hereafter a red-letter day in their calendar, denoting the date on which the Bishop of the diocese, through the generous terms offered him by a newly-elected member of that Society, acquired, on behalf of the Church of England, the stately ruins of Glastonbury Abbey. To whom the charge of the abbey will be entrusted, and what will be done to secure the ruins from further decay, will be a matter for anxious consideration, but we can rest assured that this matter is in safe hands, and we can congratulate ourselves, as well as the Bishop of the diocese, on the success of his appeal for contributions to the purchase fund. Passing on to welcome the Society to Shepton, Mr. Somerville remarked that how long it had been a town, and when it ceased to be a hamlet of Pilton, he had failed to discover. Shepton Mallet owed, no doubt, its first name to the sheep whose wool built up its future prosperity. The second name was connected with the great family of Malet, who owned such large estates in Somerset and Devon in the Norman period. Turning to a consideration of the district they were about to visit, he said there were features connected with it which made it one of the most interesting in the county. The geologist, botanist, archæologist and historian could each find subjects worthy of his attention. In his "Reverie on the Mendips," Professor Lloyd Morgan took them back to an age when the Mendip Hills, once mighty mountains, were being built up by those tiny denizens of the clear blue sea which overlay the older red sandstone. Now that new terror, which threatened to destroy the charm and peace of rural life, had compelled them to investigate a far older formation than even the old red sandstone in search of a harder stone for their roads, and by calling to their aid the ghosts of extinct volcanoes they hoped to lay that dust fiend which the twentieth-century motor-car had raised. In connection with geological matters, he drew attention to the splendid beds of oolite to be found at Doulting, and the valuable building stone which had been used for some of the older work of Wells Cathedral. He added that the coal measures so well known on the north side of the Mendips extended, so geologists told them, on the southern side for a considerable distance, and some day their peaceful rural villages might become centres of an important mining industry. The botanist was much indebted to the local Natural History Society, which for the past seven or eight years had investigated the flora of the neighbourhood. Rare plants were to be found there, but their habitat they had kept secret, lest there were too many inquirers after them, and their existence became there, as elsewhere, but a memory of the past. The archæologist might, under the guidance of Mr. St. George Gray, explore the camps of races whose history had to be built up out of earthworks, pieces of pottery and a few other mementoes of a bygone age. In the local museums, thanks to the generosity of the late Mr. Phyllis, could be seen many mementoes of Roman occupation at Shepton, but they regretted the disappearance of the potter's kiln, which was shown to the Society on the visit of 1865, and the site of the Roman villa near the Charlton railway station. The Fosse road was, however, still with them, an interesting paper on which, by Mr. McMurtrie, was read at the Society's second visit in 1884. Wool and the trade in woollen goods were for many centuries the chief source of the national wealth and had an important bearing on our domestic, political and economic history. Those Mendip Hills must have carried many thousands of sheep, whose wool not only supplied the local demand, but also the foreign market. In Saxon times, and for some time after, there appeared to have been no separate craft of weavers, no mention of them appearing in Domesday. Probably at that time each family made its own woollen cloth and garments in the long winter evenings. Contemporaneously with the rise of craftsmen's guilds they found the formation of merchants' guilds, which, like the former, were at first mere voluntary combinations, and subsequently received recognition by an authority from the Crown, which granted them charters confirming their rights and liberties. While the object of the craftsmen's guild was to control the craft

to which they belonged, that of the merchants' was to secure a monopoly of the trade of the district. At an early date the functions of the court leet must have been transferred to and amalgamated with these merchants' guilds, which thus became the foundations of municipal government. The President gave interesting details concerning the cloth trade in the past centuries and the operations of guilds. The fourteenth century was a time of great prosperity, and much money was spent on the rebuilding of churches which had fallen into disrepair during the stagnation in trade and depression caused by the long wars and the "Black Death." Croscombe Church was rebuilt at this time. On two of the bosses in the nave roof of this church might be seen figures of a man and a woman kneeling, with rolls of cloth-like scrolls round the edges, no doubt denoting the benefactions of some wealthy clothiers who were then living at Croscombe. Shepton Mallet Church, whose magnificent roof was perhaps the finest example of its kind, was a rather later restoration than Croscombe, but if they had the records of its rebuilding they would find on them the names of wealthy clothiers. He alluded to the guilds and to the settlement of Flemish weavers at Glastonbury in 1551. Alluding to the revival of trade in Edward VI.'s reign, he said they found Taunton holding a very important position as a manufacturing centre, its trade in woollen goods being almost equal to that of Bristol. He traced the history of the clothing trade through subsequent periods, and said that gradually that industry in the West had passed away, one cause being that the manufacturers did not keep pace with the times as did the men in the North by the introduction of spinning and other machinery. A few old people remained in the neighbourhood who could remember cloth and silk mills at Shepton and Croscombe and a hat factory at the latter. He could himself remember the last silk mill at work at Croscombe and a few weavers' looms in the cottages. There was now a thriving velvet factory at Bowlish, a hamlet of Shepton, and there were some indications that at some future time Shepton might regain its position as a manufacturing centre. Still, their old churches, some interesting old houses and charities remained to tell them of a prosperity which had passed away.

The Dean of Wells proposed a hearty vote of thanks to the President for his interesting address, and

The Rev. C. W. Whistler, in seconding, said the President had brought before them a subject they ought to know more about—the history of the old industries of the county. The motion was heartily agreed to.

#### *Shepton Mallet.*

The archæologists afterwards visited the parish church at Shepton Mallet.

Dr. F. J. Allen explained that the church was one which had suffered very severely from vandalism, both at the Restoration and still more during the Victorian period. The church was restored in 1837, and in 1850 the chancel was reconstructed. The oldest visible part of the church consisted of the two side arches nearest the chancel. The arches were of the date about 1180, and were cut through what was previously a solid wall. Whether there were any aisles to the original church was not known; there were no signs of anything of the kind. If there were no aisles the nave consisted of a building only 14 feet in width, 25 feet in height and 40 feet in length, which were proportions of an early Norman or early Saxon age. The chancel arch was Early English, and of the period between 1190 and 1200. The next oldest part of the church was the tower, which was about the period of 1375, or shortly after, and it was the oldest and the parent of all the great towers in the county. Dr. Allen also drew attention to the magnificent roof, which, he said, was a waggon-head roof of the period of 1500; and by a long way the best of its kind in England. It contained 350 panels, each one of a different design, and there were no two bosses alike. There were eighteen angles on each side of the roof, besides other ornamental details. The beautifully-carved pulpit of the post-Reformation period was also described, and an interesting fact was noted that the recent cleaning off of old plaster had revealed, amongst other things, an ancient squint on the south side of the chancel arch, also fragments of niches between the windows of the clerestory which formerly contained statues. The alterations also made it apparent that the nave and the tower were at one time separate buildings.

The company then inspected the fine old market cross in the centre of the town, and also the shambles in close proximity, Dr. Allen pointing out that the latter were the rarest thing of the kind in the kingdom.

The members drove to Dulcote Quarries and afterwards visited Dinder Church, the ancient architectural features of which were described by the President. The also visited Dinder House, the residence of the President of the Society.

When the members returned to Shepton Mallet the party, under the direction of Dr. Allen, were escorted around the old town and shown several interesting features. The annual dinner was held at the George Hotel, and this was followed by a meeting in the Council Hall, at which a paper by Mr. F. Bligh Bond, of Bristol, on "Screen Work in the Churches of North-East Somerset" was read. The Rev. D. Melville Ross gave some interesting information as to the former Corporation of Langport (1596-1886). Mr. H. St. G. Gray showed some lantern slides of Sma Down Camp, Evercreech, and a lantern exhibition of photographic studies of Shepton Mallet Church by Dr. F. Allen and the Rev. R. L. Jones (vicar) included details of the famous carved panels in the roof taken at close quarters during the restoration. Some of these showed the shoe marks of the iconoclasts of Cromwell.

#### SECOND DAY.

The programme was an exceedingly interesting one but unfortunately heavy and frequent showers considerably detracted from the pleasure of the day's excursions. A party of about eighty left the George Hotel, Shepton Mallet, at 9.30 A.M., and a few miles' drive through a picturesque country brought the archæologists to the extensive parish of Doulling, containing many places of deep interest to the antiquarian. The parish church was first visited.

#### *Doulling.*

The Rev. F. W. Weaver read a paper on its history. He pointed out that they were now in the Glastonbury country, Doulling Church, with others, having been formerly attached to the abbey at Glastonbury. Such churches were usually very fine, and there was no doubt that prior to its restoration Doulling Church was a magnificent edifice. There was hardly any part of the church that had not been taken down stone by stone and built up again. One of the few things allowed to remain in its original state was a beautiful Norman door. The church was practically rebuilt in the year 1869, and it was extremely pleasing to think that the Somerset Archæological Society visited the church four years before it was touched, and they had recorded a very valuable article, written by Professor Freeman, who told them exactly what the church was like before it was restored. Professor Freeman, speaking of the original church, said its history was pretty plainly written in its stones. Sir Richard Paget had also contributed some interesting details concerning the restoration which sought to reproduce the church in exactly its original form. All the old material, however, was not reused, and the party would be able to see in the vicarage garden several fine portions of the south doorway, &c., which were discarded, he thought, unwisely. The chief point of interest in regard to Doulling, however, was the fact that it was the deathplace of St. Aldhelm, Bishop of Sherborne, in 709. St. Aldhelm, who was trained in the abbey of Malmesbury, was the great apostle of the neighbourhood at a time when heathenism was rampant. He was in the habit of planting his cross in different parts, and around the cross was built a little wooden church, which was eventually replaced by nobler structures. St. Aldhelm was buried at Malmesbury, and Saxon stones were said to mark each seven miles the distance his body was taken. The Bishop of Bristol had been able to identify several of these stones, whilst (the speaker) had recently discovered another. In the vicarage garden was St. Aldhelm's Well.

Mr. F. Bligh Bond said, considering the extensive restoration, the result might be considered very satisfactory for it was gratifying that they could see so much of what was really there before. The tower and a great deal of other carved work was retained. The two especially fine transept roofs appeared hardly to have suffered at all in restoration. With regard to the nave, that was entirely modern, but in other parts the original work was well retained.

The Rev. E. H. Bates commented upon the unusual size of an octagonal tower in Somerset, and said such towers appeared to be confined to about a dozen churches in a well-defined belt through the county.

The Rev. J. Derbyshire, the rector, also gave some details concerning two brasses in the church, several tombstones in the churchyard, the bells and the churchwarden's accounts.

After the archæologists had examined the interior of the church and had visited the rectory garden and St. Aldhelm's Well, the tithe barn next claimed attention. Dr. F. J. Allen briefly explained the points of interest, observing that though not as ornate as some of Somerset's tithe barns, it was yet one of the largest. Much of the original style of roofing was visible, whilst attention was directed to the somewhat unusual height of the doorways, admitting the entrance of waggon-loads of hay.

A short drive brought the party to the famous Doulting Quarries, the stone of which plays so important a part in ecclesiastical buildings. The geological formation of the East Quarries was explained by the Rev. H. Winwood, of Bath, whilst Mr. Staples, a member of the firm owning the Quarries, gave details of their modern working, illustrations being afforded of the ease with which slabs of the stone were cut.

#### *West Cranmore.*

Another stormy drive through well-wooded country brought the party to West Cranmore, the church (a chapelry of Doulting) being the chief object of interest. Before entering the building Dr. Allen pointed out that the tower was considered the feature of the church. The tower had always been much admired, being picturesque and standing well. In point of outline it was an imitation of the tower of Shepton Mallet Church, but although the details were so similar to those of the tower at Shepton Mallet, yet the tower of Cranmore Church was much later. The details were imitated, and yet with considerable degeneration. The tower belonged to the late fifteenth century, about 1460. The tracery of the windows considerably resembled that of Bruton and Evercreech. It was said to be the smallest tower of the important towers of the county, except that of Wilsington, near Taunton, its height being 64 feet 10 inches.

On entering the church, the Rev. E. H. Bates had several interesting things to say about the interior, especially drawing attention to a brass to the memory of the Strode family. It was curious, however, that the brass commemorated their birth instead of their death.

#### *Leigh-on-Mendip.*

Leigh-on-Mendip was the next place of stoppage.

Mr. Bligh Bond gave a brief review of the architectural features of the church, pointing out that there was hardly a feature in it that did not belong to the fifteenth century. The roofs were exceedingly fine, and from their form recalled the handsome specimens in the transepts of Doulting Church. A doorway in one of the walls suggested an entrance to a former rood-loft. The woodwork was very fine, the fifteenth-century benches being especially worthy of notice. His attention had been called to the last bay of the nave roof, but he might say that it was frequently found that this part of the nave roof was canopied and enriched.

The Rev. J. E. W. Honeywill, the vicar, read a paper on the history of the village, and also gave details of the church. He mentioned that the plaster on the north and south transept walls had been stripped off, with the result that in one wall an entrance to the old rood-loft was found. The pulpit was remarkable from the fact that it was the ankofering of the people of the parish for the escape of a former vicar, who was shot at whilst preaching by some one who disagreed with the introduction of surplices.

The Rev. E. H. Bates called attention to the beautiful glass in the west window. It was the finest piece of glass in a church window, in its general design, that they had in the county. Dr. Allen, outside the church, pointed out the beauty of the tower, which, he said, belonged to the Glastonbury school of construction. What the tower lacked in delicacy of detail it made up in beauty of detail.

#### *Moon's Hill and Maesbury.*

The next stoppage was at Moon's Hill Quarry, where the Rev. H. Winford once more delighted the party with a paper and interesting sketch of the geological aspect of the Quarries. He pointed out that the stone was of volcanic origin, its proper name being andesite and not basaltic. The quarry was discovered by the late Chas. Moore, and in his researches since made by Professor Reynolds it had been found that the stone extended right through the Mendips. The stone was particularly suitable for road construction, being dustless, and in a motoring age the demand for it was beginning to be very great. At the Moonhill Quarries, on the opposite side of the hill, Professor Reynolds had discovered silurian fossils, and geologically this was considered a discovery of premier importance. At Maesbury Camp Mr. H. St. George Gray pointed out that the name of the camp was pronounced in three ways. Although it covered some seven acres the

camp was not of a rare type, and its chief claim to popularity was the marvellous view which could be obtained from it of the surrounding country. Indeed, it commanded the finest view of any point on the East Mendips.

#### *Croscombe.*

The President gave a description of the church, remarking that he was secretary of the committee which in 1891 undertook the very careful restoration of the building. The village itself was a very interesting one in many ways, at one time carrying on a thriving woollen industry. An old church was there before the present Perpendicular church was built. There was very little of the old structure left, but at the south porch there was an interesting old doorway, the date of which could not be put later than the early part of the fourteenth century, or possibly the latter end of the thirteenth century. During the fourteenth century the church got into a very dilapidated condition, and a priest who was offered the living refused on the ground that the chancel was in a ruinous condition and that the glebe and parsonage were in the same state. Like many other churches, its condition was largely brought about by the long wars with France and the Black Death. The present church was built some time between 1400 and 1440—probably between 1410 and 1430. The roof over the nave, the pulpit and the very handsome screen were Jacobean, the pulpit bearing the date 1616. The church also contained a number of very fine fifteenth-century benches. The bells were of particularly rich tone. There were formerly a number of guilds in Croscombe, and these used to take a very active work in the church's life.

Mr. Bligh Bond called attention to the fact that in the handsome screen the royal arms were substituted for the usual cross.

A short time was spent in admiring the interior, special interest being taken in the "treasury," an annexe to the church, a building in which it was thought the vestments and other treasures in the time of the chantries were stored.

In the evening the Shepton Mallet Natural History Society entertained the members of the Society.

#### THIRD DAY.

Chesterblade Church (chapelry to Evercreech) was first visited, and after a preliminary inspection of this quaint little building the party gathered around the churchyard cross, from which the Rev. W. T. Dyne, vicar, gave an interesting description of the church, which is dedicated to the Virgin Mary, a figure of whom occupies a niche above the south porch. Having drawn attention to the surviving Norman work, the vicar mentioned that the font in the church was pronounced by Bishop Hobhouse to be rude enough for pre-Norman times. There was formerly a Norman band around the font, but about fifty years ago that was removed. The windows of the church were of later insertion. The bell turret was admired by a great many people and was one of the features of the church, which had been attached to Evercreech from earliest times. The chancel was pulled down in 1767, and Mr. Bligh Bond was of opinion that some of the old material was reused. The carving at the end of the nave was said to resemble that in a Kent church. The pulpit was modern, but the church possessed an interesting Elizabethan chalice. The registers had been kept with those of Evercreech.

#### *Small Down.*

The next place seen was Small Down Camp, which a few years ago was partially excavated by Mr. Gray, who gave a comprehensive description of its plan. He pointed out that Roman relics had been found at Chesterblade, but not in the camp, and this led him to believe that possibly a Roman villa or encampment once existed near the village. The entrance to the camp on the east was 33 feet in width, the same as that of Maesbury. There was a triple line of earthworks on the weak side of the camp, but as they followed around to where the approach was more precipitous there was but a single rampart. Excavations were made to the depth of seven feet, when it was found that the former inhabitants of the camp had excavated the solid rock to the depth of several feet, which was remarkable, seeing that in that age iron had not been discovered. The work was probably done by deer horn implements. Excavations in the ditch had revealed fragments of bronze and flint implements. In another cutting a few fragmentary human remains were discovered. The chief feature of interest in the camp was, however, the row of eleven barrows, some of which had been disturbed prior to his excavation. In his opinion the barrows were raised before the earthworks were made. In one undisturbed burial-mound there was

found evidence of a cremated interment. Having given other interesting details concerning the camp, Mr. Gray said the date of its creation was not later than 400 B.C., and was probably much earlier. Although the atmosphere was not favourable yet the party much enjoyed the view to be gained from the summit of the camp.

#### Batcombe.

At Batcombe the church is a large and ancient building of stone, chiefly in the Perpendicular style. Dr. Allen described the magnificent tower, which he characterised as one of the finest in the county. It bore a resemblance to that of Leigh-on-Mendip, but its features were chiefly derived from that of Bruton. It was distinguishable from the fact that it bore no pinnacles, but from its construction it seemed as if it were intended to carry a spire. Although the tower derived its details from Bruton tower, yet the treatment of its windows was derived from the central tower of Wells Cathedral. It was a triple windowed tower, but the lines of the window were carried down to the lower stage, as was the case in the central tower of Wells Cathedral. The tower had been classed as of the Wrington type, but he differed from that view, believing that it was the work of the Glastonbury school of masons. If the date of Bruton tower was 1460 he believed that Batcombe tower was built almost immediately afterwards, as it bore no trace of degeneration in detail.

The Rev. F. W. Weaver described the carved accompaniment of angels surrounding the figure of Christ in a canopied niche on the west face of the tower.

The vicar (the Rev. W. C. Baker) also added some interesting remarks concerning his ancient church, which he remarked was greatly in need of restoration.

On entering the building the Rev. F. W. Weaver read a paper relating to the church and its history. He remarked that most of his information was derived from a paper written by the Rev. E. H. Bates. He called attention to the beautiful external staircase leading to the rood-loft, and the chancel and nave roof. The font was a good specimen of the Perpendicular period. The church also contained a number of monuments and commemorative tablets, there being one to Philip Bisse, who was rector for forty-five years and also Archdeacon of Taunton.

#### Evercreech.

After luncheon the party at once proceeded to inspect Evercreech Church, which is dedicated to St. Peter. Dr. Allen remarked that at first sight they would hardly think that the tower was related to that of Batcombe, as a different impression was given at the first glance. Yet the two towers had many details in common, and there was no doubt they were built by the same school of architects. The point in which the tower most resembled that of Batcombe was in the way in which the line of the windows was carried down to a lower stage. There was more excuse for calling Evercreech tower of the Wrington type, inasmuch as there was considerable similarity between Wrington tower and Evercreech, but he saw no reason whatever for the suggestion that it was a copy of the Wrington tower.

The Rev. W. T. Dyne, the vicar, gave a short account of the church, which, he said, was described by Bishop Hobhouse as a typical Somerset church, and the glory of the village. He mentioned that the handsome cross was removed from the churchyard to a place outside late in the eighteenth century.—Mr. Bligh Bond shortly drew attention to the chief architectural features of the church.

#### Pilton.

The last place of visit was Pilton. The party at once proceeded to the large and handsome church. The Rev. E. H. Bates detailed the chief features of interest. He observed that when the church was restored very little of interest was left by "the destruction committee." An ancient church formerly stood on the site of the present building, but all trace of it had disappeared. Pilton was formerly the centre of an enormous parish, which included Shepton Mallet, Croscombe and other parishes. There was a Norman doorway in the south porch, whilst an unusual feature was the two-storey chancel. There were also very interesting churchwardens' accounts, one of the few pre-Reformation accounts preserved. The register went back to 1560, and mentioned the names of the last English serfs.

Mr. Bligh Bond described the remaining screenwork in the church.—The vicar (the Rev. Preb. C. W. Bennett) subsequently conducted the party over the edifice.

Tea having been partaken of at the church house, the tithe barn was inspected. The party then returned to Shepton Mallet, all agreeing that the 1907 meeting had been one of the most successful.

### NORFOLK CHURCHES.

THE members of the Norfolk and Norwich Archaeological Society, to the number of about sixty, visited last week the south-eastern part of the county. Under the guidance of Dr. Godfrey Bately and Mr. W. H. Jones, Yarmouth, visits were paid to eight of the churches which stand on the high lands bordering the marshes of the Waveney, Yare and Chet, and also to Langley Abbey and Claxton Castle. The churches are chiefly remarkable, some of them, for the beauty of the Norman doorway, and in two cases for the apsidal chancels, evidence of the great antiquity of the ecclesiastical edifices in that part of the county, which appear not to have been superseded by later erections to so great a degree as in the remainder of Norfolk.

#### Haddiscoe Church.

The members went to Haddiscoe Church, over the dam constructed by order of Dame Margaret Hobart in the reign of Henry VII. It is built on an eminence, the natural strength of which has every appearance of having been improved by artificial means, and the finding of the handiwork of neolithic man in the churchyard may be taken as evidence that the site was utilised so far back as prehistoric times. The round embattled western tower has ungainly angular architraves over the windows of Early Saxon or Norman workmanship. The south doorway is a beautiful example of Norman work, with zigzag and billet moulding, and has a niche over it containing a seated figure in episcopal dress. Symbols of the Evangelists are carved upon the font. A double piscina in the chancel has trefoil arches. In the nave is a stone commemorating the wife of Jan Piers Pie, a Dutchman, who was dyke-grave in the vicinity in the middle of the sixteenth century. The church was restored in 1861, when some interesting mural paintings were discovered. In the time of Henry III. there was in Haddiscoe a preceptory of Knights Templar, who had in the church a chapel dedicated to St. John.

#### Thorpe-next-Haddiscoe.

Owing to some misunderstanding the church, which has been newly thatched, was not open, and consequently of the exterior could be examined. Dr. Bately read a paper showing that there was probably a church here before the Norman Conquest. It has a low round tower with very early windows, probably Norman, and a thatched nave and chancel, the latter erected about seventy years ago. During the ravages of the Black Death three clergymen were presented to this living in one year.

#### Thurlton Church.

This church, which is also thatched, has a square embattled tower. It contains a massively-bound Bible dated 1613, and the plate is of particular interest, as Mr. J. Walter—whose wide experience renders the statement remarkable—asserts that the chalice, dated 1554, was the smallest he had ever seen. There is also an interesting fresco of St. Christopher.

Mr. W. H. Jones read a paper, in which he said that there were in this parish several lordships at the time a grand survey was made. The fabric existing here originally was so entirely transformed and rebuilt about the middle of the fourteenth century, i.e. soon after St. Giles Hospital had acquired possession of it, that very little of distinctive features of the old church remains; but of the little the Early Norman masonry forming the arch and sides of the south entrance is in beautiful preservation. What we see to-day everywhere else is Perpendicular character. The tracery of the screen is very fine, although the painted panels and canopy supporting the rood-loft are gone. The north entrance is particularly good. Immediately over the arch is a representation of the Trinity, the Father supporting with both hands the Cross, on which is suspended God the Son, while in the spandrels two angels censing. In the moulding on each side of the entrance and running up over the arch is a succession of crowns. The tower, containing a peal of bells, is square and noble, but it has been robbed of its pinnacles; a portion of one of them is inverted at the head of a rustic's grave, which serves as a gravestone. There was formerly the Guild of All Saints in this church, and the image of St. Mary has been placed by the north wall. The register dates from 1558.

#### Norton Subcourse Church.

This is a large and unusually lengthy church, with a low, round tower. The windows are mostly Early Decorated, the tracery in the east window being particularly noteworthy.

Mr. W. H. Jones, in the course of a paper, pointed to various considerations which led to the conclusion that the tower was of very ancient erection, and was a part of the church recorded as being here in the time of Edward the Confessor, its foundation being undoubtedly due to the Abbey of Bury St. Edmund, the monks of which held the manor. Their under-tenant was one Goscline, who, being so lord of Loddon, subsequently took his surname from that town. The last of the family of De Loddon dying without male issue, his inheritance came to his three sisters, and as his property and patronage became vested in several families. In 1387 the College of Raveningham was removed by the King's license, and that of Henry Spencer, Bishop of Norwich, and by Sir John de Norwich's will, to this parish. There were then thirteen chaplains, and a new fine chapel was built. It would seem that this church may be the chapel alluded to. It is 106 feet long, and although devoid of aisles, is as wide as many churches having those appendages. Its size would indicate that it was intended for some use beyond that of an ordinary parish church, and the conclusion that apparently obtains as to its dedication—some books stating its patron saint as St. Margaret and others as St. Mary—points to the same conclusion. There was in this church St. Margaret's tabernacle, and he would suggest that its original dedication, in Saxon times, was to St. Margaret, but that when the college of St. Mary was transferred here from Raveningham, and the nave and chancel of this church rebuilt, it was dedicated to St. Mary, and a tabernacle to St. Margaret kept in remembrance of its original patron saint. There is here, beneath a canopied recess in the north wall of the chancel, the tomb of Sir John de Norwich, the translator of the Raveningham College, and the heads of windows in the nave, shields containing the arms of England and of the families of Hales and Otteburt. This last family was a very ancient one. The chancel is very spacious, and on each side of it formerly were the stalls of the master and brethren of the college. In the north wall still remains a very handsome double piscina and sedilia. The beam of the roof-loft is still in position, and a holy-water stoup exists in the south wall of the nave, whilst in the wall opposite are three niches where probably saints once stood.

#### *Heckingham Church.*

Finely situated on an eminence close to the border of the marshland, this church has an interesting apsidal chancel and magnificent Norman south doorway, which has been restored, and is a gem in the eye of antiquaries. The base of the tower is round, on which an octagonal structure has been erected with ancient red bricks for pinnacles, giving a very pretty result. The apse is supported on the outside by buttresses, considered by Dr. Bately to be Saxon, being practically the same as those at St. Martin's, Canterbury. There is no Norman window, the lights being of Early English. In the north aisle is a sepulchral slab to the memory of Hugo, abbot of Langley in 1283. On the south wall in the north aisle there are shields to the memory of the Erpingham, Clifton and other families.

#### *Hales Church.*

This church is also thatched, and has a lofty round tower with curious cheques in flint, brick and freestone on the parapet, and narrow slits for windows. All the beautiful features of the building are on the exterior. The chancel, which is somewhat lower than the nave, is apsidal, supported by Norman buttresses, and having Norman arcading round the apse and continued for one arcade on the north wall. Both north and south doorways are of magnificent Norman work, which, though unprotected by any arches, is in almost perfect condition. Most of the windows are Early English. The only other striking feature of this most interesting church—interesting because the ground plan appears hardly to have been altered since Norman times—is the remains of the entrance to the rood-

#### *Loddon Church.*

This proved a most interesting example of Perpendicular work. In the churchyard at the foot of the tower are two massive uninscribed tombstones traditionally said to mark the graves of a man and a boy who were killed by a fall from the scaffolding during the erection of the church in the fifteenth century. The following paper was read by Mr. W. H. Jones:—

In many of the rambles of our Society amongst the churches of Norfolk we have met with problems of architecture, in structure and in detail, which have been as instructive; but here in Loddon we have a

church the well-defined features of which are as clear to us as an open book. It is not the original church of the parish; that was cleared away, owing most probably to its decay, and of it we have nothing to remind us save an allusion to it in the Liber Albus of St. Edmundsbury Abbey, which refers to it as having been one of the earliest foundations in England, owing its erection to Felix of Burgundy, the first bishop of East Anglia; but the font, the remaining portions of the screen, and one of the brasses, dated 1462, may be late vestiges of this older church. But of the present church, dedicated to the Holy Trinity, we need not search for evidences of its date. Not only is the style of its architecture apparent, but we have precise record of its foundation. Until recent years a portion of a painted window remained here, an account of which Mr. Copeman communicated to our Norfolk archæology, and which bore an inscription to the effect that Sir James Hobart, of his generous benefaction, completed the building of this church in three years, the eleventh year of Henry VII., 1495. Only a few words are necessary concerning the personality of this knight. He had close ties of relationship with Norfolk ere becoming connected with Loddon, but he lived in London, and rose to eminence in his profession until he was appointed Attorney-General to Henry VII. He appears to have acted as legal adviser to some of the prominent families of Norfolk, amongst them the Pastons, of whom John Paston, writing to his mother concerning the family troubles in 1478, tells her that there will be no further difficulty in seeing James Hobart, because, he says, "He purposeth from henceforth during his life to be a Norfolk man, and to live within two miles of Loddon." He purchased Hales Hall in this parish, and principally rebuilt it. He had married, firstly, Margaret, sister of Bishop Lyhert, of Norwich, who was the builder of the screen in Norwich Cathedral, of the beautiful vaulted roof of the nave there, to the cost of which Hobart was a considerable contributor, and of the great west window; and Hobart himself is memorialised in the nave by the altar tomb which still stands there. When we remember that these great works in the cathedral were in progress, and that many of the parish churches of the city, including that of St. Peter Mancroft, which this church so much resembles, were constructed during Hobart's life here, we need not look far to discover whence he gained the taste for building which led him to the construction of this church. In all its detail the Perpendicular style is complete and fully developed and the church is a fine specimen of the architecture of the period. We may conclude our reference to Hobart by observing that he was knighted in 1502-3, and that he married, secondly, Margaret, daughter of Peter Naunton, of Letheringham, Suffolk. On the south wall of the church is a quaint painting which has been judiciously framed and glazed in recent years, and containing portraits of Sir James Hobart and his second wife. They are represented kneeling at a table, between their heads being two shields, the one bearing the arms of France quartering those of England, and the other those of Hobart. In the left-hand corner is a picture of this church, and in the right-hand one a view of St. Olave's, or Tooley's Bridge, over the Waveney, which, the inscription beneath records, were respectively built by Sir James and his wife, although a similar picture at Blickling of a later date ignores the companionship of Lady Hobart with her husband in the building of the bridge.

The details of the church are many and interesting. The well-preserved pulpit is Jacobean. Beneath it has been fixed the panelling of the Perpendicular screen, all that remains of what was once one of the glories of the church, but which was subsequently employed for seat backs, and only quite recently arranged in the form in which it now appears. It is noteworthy because of the elegance of its paintings. Principal amongst these is a representation of St. William, whom you will remember as the boy who early in the twelfth century suffered martyrdom at the hands of Jews in Thorpe Wood, near Norwich. Here he is depicted wearing a loin cloth, and is attached to a pole placed transversely in the forks of two rough uprights. His body presents the appearance of a saltire cross—the hands above the head, the legs apart. The left hand and right foot are bound, and the right hand and left foot nailed, to the uprights, details which show a perverted knowledge of the true story of the martyrdom, which would have been properly represented by the right hand and foot being bound and the left hand and foot being nailed. On the left of the picture are three men and on the right two; the foremost of the latter pierces the boy's left side with a knife, and

holds a basin to receive the blood, intimating a belief on the artist's part that the Jews would use the blood for ritual purposes. It is believed that this is the best of all the ten or eleven paintings of St. William which have been identified. The other panels of the screen bear representations in the life of Christ, viz. the Nativity, the Adoration of the Magi, the Circumcision, the Presentation and the Crucifixion.

The east window, of graceful proportions, has recently been thoroughly repaired, in common with much of the fabric of the church, and its glazing has been rearranged by the Ecclesiastical Commissioners. In the former arrangement the figure of Our Saviour held a prominent position, but the painting has now been inserted in the east window of the north aisle. The ancient glass representing the Apostles has been preserved in the top smaller lights of the east window. The shields of arms are so numerous that time would fail us to-day to enumerate them, but those of the Hobarts, the Bacons, Fastolf, Drury, Harbord, Howard, Spencer, Berney, the Palmers of Loddon and Yarmouth, and of the see of Norwich, will be recognised amongst many, but none of unusual interest. In the north aisle is a beautifully carved marble tomb with recumbent figure of Lady Dionis Williamson, of whom it records that she gave two thousand and one odd pounds towards the rebuilding of St. Paul's Cathedral. Amongst the many brasses there is an example of the shroud brass in the north aisle, bearing the figures of Katherine Hobart and John Blomeville, 1546, precisely similar in design to the shroud brasses of Richard and Cicely Howard at Aylsham. This ghastly style of memorial is more general in the eastern counties than elsewhere, and was frequently laid down during the lifetime of the persons who were intended to be commemorated, in order that they might constantly be reminded that they were but mortal. The stone coffin lids in the north-west corner are noteworthy, one of them bearing a cross having a rounded head instead of the usual square head. Close by them are the old-time and interesting bench and desk long used by the archdeacon during his visitations.

The font is but a dilapidated relic of what was once a splendid octagonal specimen, and which bore on its panels representations of the seven sacraments, the eighth bearing a representation of the Crucifixion. Baptism was on the left of the Crucifixion, being the first sacrament that we can receive, and the series is completed by the "extreme unction," which, as Bishop Forbes has it, is "the lost Pleiad of the Anglican firmament." But these panels have been hopelessly obliterated; and if it will be of any satisfaction to you to know who committed this outrage, you may be told that it was a gentleman named Rochester, the glazier who was paid 6s. by the churchwardens for his work of vandalism in 1642. The base of the font is marvellously developed, throwing the font itself quite out of proportion, but this may have been by design, so that the ceremony of baptism might be seen as impressively as possible by the congregation. During the recent restoration of the church the font was removed considerably westward from its earlier position. The ancient poor's box is most interesting, though not unique. Hone describes and gives an engraving of it. He speaks of it, as you find it to-day, as "two separate boxes, each secured by two padlocks; over these is a hole in the lid for offerings." He continues:—"When a sufficient sum was collected, it was taken out and placed in the adjoining box in the presence of two churchwardens."

In the parvise there was long carried on the school of the parish, over which, it is stated, the father of the poet Crabbe once presided. At present this quaint little chamber contains some of the time and weather-worn stones taken from the exterior of the porch during restoration. Viewed from the font the beautiful proportions of the church, with its lofty east window, its lightsome windows and its graceful clerestory, may be well appreciated, and I think it only remains for us as a Society to offer our congratulations to the vicar and churchwardens upon the exceedingly careful manner in which this ornate church has recently been repaired, and the excellence of the work which has been introduced in the seating and other new features around us.

#### *Chedgrave Church.*

This is a most remarkable architectural conglomeration, consisting of a north aisle, a nave and chancel, a truncated square tower with a conical thatched roof at the north-east corner, and a modern south porch erected to the memory of General John Barrett of the Indian Army, who died at Rawul Pindi, Punjab, December 15, 1880. A slab in the

tower reads, "This Church Repaired and Beautified 1819, but evidences of the latter were not very apparent. In the east window is some curious Flemish stained glass.

#### *Langley Park and Abbey.*

From Chedgrave the party proceeded through Langley Park, redolent with the scent of hay and glorious with fine foliaceous trees, to the hall, where, by the kindness of Sir Reginald Beauchamp, Bart., afternoon tea was provided for the company. The hall, built in 1740, has not a beautiful exterior, but the interior amply compensates for this, and the visitors found much enjoyment in inspecting the picture gallery including works by Vandervelde, Murillo, Bartolommeo and Sir Joshua Reynolds, and a bronze statue of Louis XV. by a French artist. After tea and a few minutes on the lawn watching the fountain playing, seats in the brakes were again taken, and the party moved on to Langley Abbey. Excavations have recently been made here, under the supervision of Mr. W. H. St. John Hope, and the ground-plan of the abbey has now been fairly well established. On the west, and now forming part of the farm-buildings, are fine groined kitchen and abbot's parlour, over which was the library (now a hayloft), while to the southward was the guest-chamber. In the church a big rubbish heap has been removed, and bits of carved stone, with colour and gilt on them, have been moved, the tomb of a knight and his wife discovered, while human remains have also been disinterred. Among the ruins of the church, ivy-covered, with stonecrops and wallflowers growing thereon, Dr. Bensly read a paper written by the Rev. Dr. Cox, F.S.A.

#### *Claxton Castle.*

This was the last stopping-place. The remains of the castle chiefly consist of a lofty ivy-covered wall with bastions, overhung with branches of the horse chestnut affording a lodging-place for roses, growing quite on the summit of the wall. It was erected by Walter de Kerdiston who in 1333 obtained a license to castellate, and in 1345 obtained permission to alter the course of the highway as to make an extensive moat round his castle. It is often mentioned in the "Paston Letters," was visited by Edward III. and is said to have at one time been the residence of Anne of Cleves. On the northern side of the wall are doorways leading into the bastions and the remains of an Elizabethan mansion erected on the site.

The company subsequently proceeded to Buckenham Ferry and then walked to Buckenham station, returning to Norwich after an excursion of ten hours' duration.

### YORK MINSTER.

THE latest "Occasional Paper" on the restoration of York Minster issued by the Dean relates to the completion of the West Front, under Mr. Bodley's direction, and to undertaking other necessary works, as will be seen from the following statement:—

There is little doubt as to what will be the verdict of intelligent and unbiassed persons, for the marvellous intricate details of the structure are once again seen almost all their original beauty. The grand façade which the Yorkshiremen, and indeed all men of taste and culture have valued for so many generations is once again presented for their pleasure and gratification, and the labours of devoted and skilful men for the glory of the House of God are seen free from the decay of time and the ignorance and careless treatment of those who either knew not or depreciated the intrinsic merits of what they handled. It has been asserted that, under the plea of restoration, many details of antiquity and taste have been destroyed, and genuine old work removed for the sake of replacing it with the new. But those who allege this must be unaware that some hundred years ago, a well-intentioned but mistaken attempt at restoration was carried out so effectually that little of the old work really remained unblemished through the lack of real knowledge in what had been handled. The appreciation of true Gothic work was then only in its infancy, and the national taste was then only beginning to wake up from a long period during which Gothic architecture was not appreciated, but rather regarded as a effete style of building, and unsuited to the climate and requirements of Englishmen. To the former we owe the ruthless destruction of many beautiful Gothic buildings of much exquisite Mediæval detail; to the latter we trace the feeble efforts made to restore or reproduce features or ornamentation of which the spirit had scarcely

evived, and the real knowledge of which was to many a sealed book.

The west front of the Minster is a not inapt illustration of this; the veriest tyro in Gothic architecture can see that much which exists in the details thereof is so manifestly devoid of the spirit and tone of Mediæval work as to be but a poor reproduction of what existed before, while additions have been made which in form and style are in discord with the school which they are supposed to represent. Great care has, however, been taken in the present restoration of the building to preserve as far as possible everything evidently original, and, where insecurely bedded, to replace it in a more permanent way. Whatever, from partial decay, could not be retained with safety to the public has been carefully removed and placed in the grounds behind the deanery, where, on application to the Chapter Clerk, those interesting survivals can always be seen by architectural or archaeological students.

Some discussion has also been raised as to the expediency of restoring the flying buttresses. It was alleged that either they never had existed or that they had been taken down because they were not required. As regards the former, the exhibition of "Ancient York" held some two years ago presented engravings which showed that they were actually in existence as late as the close of the seventeenth century, while sufficient fragments have been found, built into other portions of the building or neighbouring walls, which conclusively confirmed these illustrations. As regards the latter, viz. that they had been removed when the original idea of a groined roof for the nave had been abandoned as never being required for a wooden roof, this has been disproved, first by the existence of flying buttresses in many buildings where only wooden roofs exist throughout England, and especially in the chapter-house of the Minster, where they are still *in loco*, and which has never had any other than the wooden roof, which exists at the present day. Secondly, the careful examination of the walls of the nave aisles by Mr. Bodley has shown that, by the pressure of the wooden roof, they are seriously out of the perpendicular, and that the original builders realising their great height and the thrust which any roof would have upon them, wisely provided this additional security at the beginning. The flying buttresses were evidently taken down at a period when there was a general indifference to Gothic buildings, and the materials used up for the sake of economy, or for such purposes as required attention either in the Minster or in the property of the Dean and Chapter. But fortunately, in so doing, sufficient portions have been preserved to enable the complete and faithful restoration of the whole, not only for the sake of their architectural beauty, but for the stability of the building. And it will be a source of satisfaction to all who contributed to the restoration fund to feel that they have assisted in the revival of these graceful and essential adjuncts to the Minster.

They will also be interested in knowing that through their munificence during the last eight years a staff of masons and labourers averaging thirty in number has been kept in constant employment and thus preserved from adding to the large number of those who have been out of work. We feel sure also that all will join with us in thanking God that during that time no serious accident has happened to any of the workmen and that no portion of the elaborate scaffolding has suffered from the many violent storms of wind nor a single spar been carried away.

It has been seen by the accounts referred to above that the funds so generously entrusted to the Dean and Chapter have proved sufficient for the work, which has been conducted with a strict attention to economy combined with efficiency. Messrs. Barron & Barron, chartered accountants, have carefully checked all payments, and Messrs. Northcroft & Neighbour have also carefully examined the amount and price of the material supplied and the labour expended thereon, and have expressed themselves quite satisfied that the money has been properly laid out and that the result of the work, both as to quality and quantity, leaves nothing to be desired.

The last restoration of the west front was completed rather less than 100 years ago, so the disintegration of the stonework has been rapid, and as ancient buildings of the same stone (viz. Tadcaster) in this neighbourhood are still as fresh as the day on which they were completed, this disintegration is due from some cause peculiar to York, and doubtless that is the action of the sulphurous smoke upon magnesian limestone. We have taken care to carry out the restoration with Ketton stone, which being an oolite sill, we hope, prove invulnerable to this influence, but as

the number of smoke-emitting chimneys throughout York has increased it is evident that unless some measures are adopted to mitigate the smoke the disintegration will be even more rapid in the future.

And this is no mere ecclesiastical question, but one which affects commercial and sanitary interests. We have read lately of the manifold danger of ignoring or neglecting this important subject. It is often said, we have been reminded, "Where there is smoke there is money," but science and practical experience teach a diametrically opposite creed, viz. "Where there is smoke there is waste of money," and Mr. Edward Atkinson, president of the Mutual Boiler Insurance Company, Boston, U.S.A., says, "Smoky chimneys give evidence of waste of fuel, because the existence of smoke is evidence of bad methods of firing and of incomplete combustion," which in London alone has been estimated at nearly two millions sterling per annum; while Messrs. Crosfield & Co., of Warrington, have stated that they save 2,500*l.* per annum on their coal bill alone by reason of the steps which they have taken to secure perfect combustion, and Messrs. Newnes, of Cardiff, have estimated their savings from similar means at 25 per cent.

But it is not only wasteful, it is detrimental. The Houses of Parliament in London, being built of dolomite limestone, are seriously affected thereby. And not only this, but Faraday, before a Royal Commission, testified to the injury done to the pictures in the National Gallery. Sir William Richmond states that the frescoes in the House of Commons, the priceless marbles in the British Museum, the public monuments in Trafalgar Square and on the Embankment, and the very bricks and mortar of the houses are being disintegrated and dissolved by the all-pervading and destructive smoke. The serious action of the acid upon the ironwork in the roof of Charing Cross station undoubtedly caused the late terrible accident.

Sir Frederick Treves further states that the health of men and animals is injuriously affected by the fogs caused thereby, filling the lungs with small smoky or sooty particles, which are hydrocarbons, with an excess of sulphuric and sulphurous acids to add to their ill effects. In 1880 the death-rate in London rose to forty-eight per thousand. And Sir Oliver Lodge firmly but justly denounces the amount of wasteful incombustion. Indeed, another writer says that the iniquity of depleting the air we breathe must be increasingly inculcated as a foul habit, just as offensive to the general welfare as contamination of drinking water by sewage, while the distinction between the respective evils of black, grey-blue or yellow smoke seems to be exaggerated.

The prevalence, therefore, of smoke not only affects the Minster, which to some, who have no taste for Gothic architecture or no sympathy with the purpose thereof, may seem immaterial, but it affects the health of the city, and it is useless to take measures for good drainage and pure water if we neglect this. It will be well, therefore, if for some time to come the condition of the fabric is regarded not only for ecclesiastical or archaeological reasons, but as a token to the citizens generally of what is really the prevailing condition of the atmosphere which they are compelled to breathe and in which they have to live.

At the present moment (continues the Dean) our funds for further progress in the work of restoration are nearly exhausted, and though the interest on the munificent legacies which we have lately received will eventually enable us to continue to do something, it will not be sufficient to enable us to make any very rapid progress, and we trust, therefore, that it may be supplemented with continued contributions. The Duke of Westminster's seasonable donation of 200*l.* enables us to carry out the much-needed restoration of the "Five Sisters" window, where the strong iron stanchions, contracting and expanding under the changes of temperature in the atmosphere, have broken the thick plates of glass put up years ago for its protection, and materially cracked and injured the stonework. These will be carefully repaired, and an outer covering of plain white glass in quarries with lead glazing substituted for the present thick green plates, but we are waiting for summer weather and still, calm days, as the ancient painted glass has become so thin that if exposed to a strong wind it might be seriously damaged.

The great east window must not be forgotten. The condition of the glass there is very similar to that of the "Five Sisters," and the repair of the stonework and the substitution of white quarried glass for the green plates should not be delayed longer than we can help.

The windows in the clerestory throughout the nave and, indeed, throughout the whole building, both as regards the stonework and the glass, should be attended to as soon as possible, not only for the preservation of these matchless specimens of Mediæval glass, but also for the safety of persons walking or worshipping beneath.

The parapet of the central tower also claims our attention, as it is in a very insecure condition, and many of the stones require to be replaced or made fast. Indeed, the whole tower requires treatment, the walls repointing and many of the gargoyles which have fallen off to be restored.

And, finally, the beautiful mortuary chapel or canopied tomb of Archbishop Bowett should not be left any longer in its present dilapidated state. The elaborate canopy was much injured by a fall of timber during the fire of 1829, and it has been entirely neglected since then. The memorial of so great and good a man deserves to be differently treated. To him we are in a great measure indebted for the grand central tower, and his courage in leading the army to repel an invasion of the Scotch, although so ill as to require to be carried on a litter, entitles him to our grateful and abiding remembrance.

#### The Contractor's Magna Charta.

SIR,—I was deeply interested in your article on "The Examination of Materials in Bulk." The question therein dealt with is one of the greatest moment to contractors generally, and it seems to the writer that the action of the Acme Flooring and Paving Company in this case may lead to the Magna Charta of contractors generally, inasmuch as it has called attention to what is undoubtedly a most iniquitous form of contract. I do not know whether you have seen the form which was the subject matter of this action; but I am personally well acquainted with it, and it does seem a most extraordinary thing that any official called upon to supervise and direct a public work should not only have the most drastic power under the contract itself, but that he should also be constituted sole arbitrator with regard to any difference of opinion or matter of fact, and even of his own actions and conduct between himself and the contractor—the arbitrator whose opinion, to use the words of the contract, "shall be binding, final and conclusive."

The writer, who has had many years' experience in this particular class of contract, has for several years endeavoured to arrange a conference of contractors in order to deal, and deal effectively, by a resolution to studiously refrain from tendering where such conditions are imposed, and I trust that now the Acme Company will use their powerful influence to bring about such a conference, in which case, heavy as the cost must have been to this company, it will be well worth the cost, if it should result in the contractor's taking at last a firm stand, and establishing his right to at least "be on the earth." It is not every man who is capable of exercising the impartial mind of a judge, and yet the powers given under such contracts as the one in question are as great and of quite as much importance to the parties concerned as those vested in a judge.

I trust you will excuse my writing at such length, but it seems to me that your article deals with a very serious question, and it is one of such moment that it would be highly interesting to hear the views of contractors generally.—Yours faithfully,

The Zeta Wood-Flooring Company, Ltd.,  
WILLIAM J. BENNETT, Managing Director.

#### Ventilation at the New Bailey.

SIR,—The grave reflections which the Recorder, Sir Forrest Fulton, K.C., expressed concerning the "ventilation" of his Court at the New Old Bailey is enough to make architects timorous in dealing with new systems and to adhere to the old. According to the Judge:—"It is impossible to open the windows. I am told that if a window is opened the ventilating and warming system is thrown out of gear. It is the most extraordinary system ever heard of since the world began. The officials have to work here all the year round, and I am astonished that they can survive it. When I came here at nine o'clock this morning the pressure was quite overpowering." The public must also suffer as well as judges, counsel and officials. Is it not the duty of the

Corporation of London to institute inquiries at once, and if there is no exaggeration in the Recorder's allegations to adopt remedies which are not impossible to discover?—  
Yours, &c.,  
COMMON SENSE.

#### GENERAL.

**Sir Thomas Drew, LL.D.**, has been appointed one of the visitors of the Museum of Science and Art, Dublin, in the room of the late Dr. John Kells Ingram.

**Dr. Hoyle**, director of the Manchester Museum, has received the 500*l.* for which he asked for the purpose of purchasing the tomb group recently discovered by Professor Flinders Petrie at Rifeh.

**The Annual Exhibition** at the Government factory, Sèvres, will be opened on August 3.

**The Nottingham Chamber of Commerce** have been considering the subject of an exchange of Nottingham and Paris Schools of Art students, with the object of widening their view and contributing to broader and more cosmopolitan methods. The question of the practicability and desirability of the suggestion has been discussed by the school of art committee, but in view of the fact that the schools are closing down for the summer vacation this week, it was decided not to take any definite steps at present, but to leave the matter in the hands of the chairman, the vice-chairman and the principal of the School of Art.

**A Copy** of G. F. Watts's painting, "Time, Death and Judgment," was presented and hung in St. Paul's Cathedral a few years ago. The artist's widow has announced that she will give another of his pictures to be placed facing his other work. Mr. Charles Booth has also given to the cathedral a replica of Holman Hunt's "The Light of the World."

**Lord Wenlock** has received the following letter, in connection with the Selby Abbey Restoration Fund, from Sir Dighton Probyn:—"I am commanded by His Majesty the King to send you the enclosed cheque for 100 guineas towards the required sum of 50,000*l.* The King was very pleased to learn that the appeal of the restoration committee had been so generously and promptly responded to, and that the balance required, which only now amounts to 16,000*l.*, may shortly be forthcoming." The Prince of Wales has contributed 50 guineas to the fund.

**The Dean and Chapter** of Truro Cathedral have decided to increase the insurance of the building from 70,000*l.* to 100,000*l.* They consider that the proximity of a large number of houses and other buildings exposes the cathedral to great risks in case of fire.

**The Burntisland Town Council** have purchased the historic castle of Rosend and the grounds connected therewith for 3,500*l.* The castle has historical association with Mary Queen of Scots having spent a night there in her flight from Loch Leven. The resolution to purchase was arrived at recently, when a special emergency meeting, convened by representation to Provost Wallace, was held and the resolution was carried by a majority of seven votes to three. Thirty-five years ago the Town Council bought the property from its owner at that period, and after reserving the rights of foreshore, sold it to the late Mr. Shepherd, from whose trustees they again acquire it.

**The Curators** of the lectureship in archæology, recently established in Glasgow University by Mr. J. D. Dalrymple of Woodhead, have appointed Professor Bosanquet, of the University of Liverpool, lecturer for the first year. Professor Bosanquet will deliver his lectures early in the spring on a date yet to be fixed, and the course which will consist of five or six lectures, will probably be devoted to the provinces of Greece, their physical characteristics, mythology and cults.

**Mr. Drinkwater Butt, F.R.P.S.**, for the better conduct of his practice in the design and arrangement of artists and photographers' studios and the restoration of old domestic work, has removed from St. Stephen's Avenue, W., to St. Anthony's Studio, 24 Queen Street, Hammersmith, where among other work he is at present engaged upon a painting studio to be erected at Cropthorne, Worcestershire, for the well-known landscape artist, Mr. T. Hodgson Liddle, R.B.A.; and, together with Mr. W. Ashworth, architect, Dublin, with the design and fitting-up of a photographic department for the new premises of the Irish Lace Depot, Molesworth Street in that city.

**Mr. Dudley Newman, F.R.I.B.A.**, late of Tooley Street, where he was, until the partnership was dissolved, in practice with the firm of Newman & Newman, has opened offices at Queen Anne's Chambers, Westminster, S.W.

## THE WEEK.

THE second International Congress of School Hygiene will commence at the University of London, South Kensington, on Monday, the 5th inst., and will continue until the 10th inst. To-morrow, Saturday, there will be informal receptions in the University and a reception at Londonderry House. Sir LAUDER BRUNTON will deliver his address on Monday. On Tuesday at the general meeting methods will be discussed for the first and subsequent medical examinations of school children. Bishop WELLDON will also lecture on "The Effect of School Training on Mental Discipline and Control in Adolescence." The subject for discussion at Wednesday's meeting will be the lighting and ventilation of classrooms, and it will be opened by Sir ASTON WEBB, R.A. On Thursday the subject will be "The School and its Relation to Tuberculosis," and on Friday on schoolwork. Papers will also be read, and there will be visits to important schools and other places. An exhibition of school appliances has been arranged. Among the delegates who will attend is Mr. ARTHUR H. REID, architect, of Capetown. He will represent Cape Colony and the Transvaal.

It is remarkable how many different ways are proposed for dealing with the Infirmary site at Manchester. The Manchester Society of Architects recently considered the subject and arrived at the following conclusions:— (1) That it was impossible from an architectural standpoint to convert the present Infirmary buildings into a satisfactory art gallery and free reference library; (2) that the site should remain as an open space in perpetuity; and (3) that the art gallery and reference library should be placed on either side of Oxford Road between the railway bridge and All Saints Church. A meeting of citizens was lately held which was attended by representatives of various societies. The following resolution was moved by Mr. T. C. HORSEFALL, who has been strenuously endeavouring to secure an art gallery which will be worthy of Manchester:—"That this meeting is strongly of opinion that without a large extension of gallery space the educational work of the art gallery committee will be greatly crippled, and urges the importance of the erection of a building architecturally suitable on the site of the present Royal Infirmary, to be devoted to the purposes of a central free reference library and art gallery and museum of the most comprehensive kind." The resolution was passed, but so many other views were expressed the following amendment was accepted as a rider to it:—"That without the express sanction of a majority of the citizens it is not desirable that the present Infirmary buildings should be demolished for the erection of an art gallery." What will be the issue of the discussions it is impossible to foresee.

TURNER died in December 1851, leaving most of his property to the public. It was not until March 1856 that the Court of Chancery arrived at the conclusion that "all the pictures, drawings and sketches by the testator's hand, without any distinction of finished or unfinished, are to be deemed as well given for the benefit of the public." There were a hundred finished pictures, 182 unfinished, while the drawings and sketches in colour and pencil amounted to 19,049. At the time the depository for the public was considered to be the National Gallery. TURNER himself wished that some of his paintings should be exhibited in positions which would compel visitors to compare them with works by CLAUDE which were in the Gallery. There could be no doubt therefore that the public in TURNER'S mind signified visitors to the National Gallery. Although we can see several works of TURNER in one room, the Trustees,

owing to the limitation of space at their disposal, have not been able to display more than a comparatively small percentage of the paintings and drawings bequeathed by this artist. Recently some examples were sent to the Tate Gallery for exhibition. Nevertheless, it is doubtful whether the arrangement was legal. Probably nobody would have the courage to vindicate the law, and as much may be said about another incident relating to TURNER which is now under consideration. An admirer of the artist has offered 20,000*l.* for the erection of a building in which more justice could be done to TURNER. But it would have to be erected in connection with the Gallery of British Art at Millbank. There can be no question that TURNER'S works have a claim to a dominant position in such a collection, but the legal obstacles are difficult to overcome. TURNER'S manifest intentions with respect to the National Gallery and the Royal Academy have been frustrated, and it is difficult to see how they can be realised without obtaining a special Act of Parliament. One should have been passed half a century ago.

A CASE was heard last week at the West Hartlepool County Court which suggests that the responsibility of architects has ceased to be nominal. Mr. JAMES GARRY, architect, of that town, claimed 31*l.* balance of his commission for services in connection with the erection of a house. A counterclaim amounting to 99*l.* for alleged negligence was put in by the defendant, a medical doctor. The architect's claim was admitted; the counterclaim was for loss arising from the introduction of a beam which was not of sufficient strength, and which failed to support the wall above it. The Judge said he believed the building owner had sustained damage due to want of that proper supervision which he had a right to look for from the professional gentleman engaged. After considering each item, his Honour gave judgment for 28*l.* 17*s.* 5*d.* on the counterclaim. The architect declared he visited the building at least twenty times, and no sign of any defect in the beam was apparent until after the final certificate was granted. The decision is important because the architect's responsibility has been supposed to come to an end with the completion of the builder's contract.

THERE is a great difference in the requirements of local authorities concerning the kind of plans which have to be deposited. One of the by-laws of the Local Government Board says that they should be complete plans and sections of an intended building showing the sanitary arrangements, with a description in writing of the materials and the mode of drainage and means of water supply. As borough surveyors are allowed to become rivals to architects and to accept ordinary commissions, it is only natural that architects should be chary of giving up more drawings than are required by official regulations. On Tuesday there was an application for a mandamus calling on the Urban District Council of Holyhead to show cause why they should not pass the plans of a church. Complete plans and sections were duly deposited, but the Council declined to express approval because elevations were not supplied also. Counsel who made the application described elevations as mere sketches which were intended to enable a building owner to realise the appearance of his property when completed. The Lord Chief Justice suggested that it was desirable for a local authority to realise what was contemplated. But at the same time their Lordships granted a rule. The principle involved is important. Hitherto construction and the preservation of health were the objects supposed to be within the capacity of ordinary authorities. But if they are to decide on the architectural appearance of a building, some precautions will be required. In London there is an architectural department, and there may be valid grounds for the objection to appearances. But can we expect similar security in every small town in the country?

## CUBICAL CONTENT OF BUILDINGS.

EVERYONE who is acquainted with the streets of London is aware that in certain districts the occupiers seem to follow classes of business which are closely related. Take Clerkenwell as an example. In many of the small dingy streets each house will be found to have a brass plate on the door which suggests that the tenant is connected with some branch of the trade in clocks, watches or metalworking. Makers of springs, dial enamellers, engravers, gilders are found to be congregated within a short distance, and a careful examination of the announcements would be enough to reveal the processes of watch or clock-making or of the reparation of plate. An American would be amused by such a simple system, which has no apparent controllers. He would be sure to contrast the mean houses with the colossal factories of the States, in which infallible watches can be produced (if the advertisements are to be credited) at a nominal cost. Clerkenwell, he will say, is England on a small scale; everything is cabined, cribbed, confined, and trade especially cannot attain expansion.

There are, of course, extensive factories and manufacturing in and around London. But the newspaper reader is continually startled by announcements of the owners of one large manufactory after another having resolved to abandon the Metropolis and to erect new buildings elsewhere. The cause is sometimes said to be oppressive taxation, which undoubtedly handicaps both wholesale and retail trade. But probably a more potent obstacle arises from the rigorous law which prevents the enlargement of premises beyond the size which was conformable to arrangements for production on a limited scale. According to the London Building Act the normal cubical content of buildings is 250,000 cubic feet. If a greater area is needed party walls and iron doors are to be introduced in order that no division is to exceed the 250,000 cubic feet. The rule applies to all buildings within two miles of St. Paul's Cathedral. Larger dimensions are possible on the report of the superintending architect showing he is satisfied that risks from fire are diminished. Then the cubic area is raised in special cases up to 450,000 feet, but the buildings must not exceed 60 feet in height.

We need not enter into further particulars of the rules and exceptions, as every architect in the Metropolis must be familiar with them. All who were in practice before 1894 are also aware that 216,000 cubic feet was the limit imposed for warehouses and manufactories. In other words, the ideal building was 60 feet in length, 60 feet in width and 60 feet in height. That was the rule arrived at in 1855, and if an owner wished to exceed the dimensions he was compelled to divide his buildings with one or more party walls with iron doors in them in order that no division could exceed the limits enacted. The Act of 1894 undoubtedly was a great improvement, but as the world has since advanced it is now found to be obsolete in its regulations.

The recommendation of the Building Act committee, which will be found on another page, would by itself be evidence that a much larger type of building has become necessary. The London County Council are not remarkable for anticipating the necessities of those who live within the metropolitan area. It may, therefore, be taken for granted that the subject of a change was not entertained until there was a certainty that the Council were about to lose an important class of rate-payers. Three months must elapse before Parliamentary powers to authorise buildings of a larger area can be sought, but the time is barely sufficient to consider all the points at issue. In dealing with such a subject the means for combating fire in a more extended area have to be taken into account. The 216,000 cubic feet was really the measure of the power of the Metropolitan Fire Brigade system in 1855. But in course of half a century not only have engines and appliances improved, but the organisation of the brigade is nearer perfection.

It must also be remembered that fire-resisting construction is more generally adopted for building, and would not be omitted from large-sized factories if the law made such an arrangement obligatory. When FAIRBAIRN proposed to substitute cast or wrought-iron beams for timber he was anxious to have appliances introduced in every factory which would prevent the metal from becoming heated. The varieties of them which are now to be obtained are more effective, and beams and columns can be protected by several efficient systems. In America, where fires seem to be inevitable the insurance rates are low for all kinds of buildings in which fireproofing is employed, and consequently there is no limit to the size of industrial buildings. The largeness of the majority of those lately erected is among the first of the constructive phenomena which strike an architect when he visits the United States.

Although British workmen are strong in prejudices they also have had to admit the advantages which the Americans possess in the commodiousness of their workshops, and for which no manual dexterity was an equivalent. This acknowledgment of the superiority of plant and buildings is repeatedly expressed in the pages of the reports of the delegates of the Mosely Industrial Commission. The necessity for capacious work-places is so general, we must conclude that if Americans were hampered by the building regulations of England their success in the production and disposal of goods would be diminished. The delegates were not able to discover any superiority in the American workmen, except what was derived from the advantages of the improved plant and the facilities for carrying out work by the capaciousness of the buildings. In a fortnight one delegate said English workmen would be on an equality with the Americans if their surroundings were similar. In one report we read:—"There is a state inspector for buildings of a large character, and all the plans for new buildings have to be passed by him, and I was assured that he looks well after all the requirements necessary for the health of the workers." At one factory the sanitary arrangements cost 20,000/. Having space at command the American owner is not obliged to adopt the shifts to utilise holes and corners which are evident in many English establishments of repute.

Whether production on a large scale is more advantageous for a country like England than the old-fashioned methods is a point on which economists do not agree. Having a larger population in proportion to area than America, it is sometimes more economical here to employ hand labour than costly machinery. But all such questions cannot be determined by the agency of words alone. Shrewd people are eager to make experiments through the agency of large factories, and as the loss, if any, will fall on them they should not be obstructed. At present many of them believe they must remove to a distance from London or they cannot have the freedom which is desirable for their enterprises. But the consequences which would follow must affect many classes, including operatives. It is for the London County Council to decide whether larger buildings can be erected with safety. In deciding such a question the evidence on which the Act of 1855 was framed is nearly useless. Safety is now a certainty to an extent which could not be then foreseen, for the principal aim of modern construction is security against fire at an economical price.

Methods of production are on their trial, and undoubtedly those which are most modern are as closely connected with efficient buildings as with efficient machinery. Changes are inevitable, and it would be absurd for English manufacturers to close their eyes to the advantages which their rivals derive from manufacturing which are specially planned to suit particular businesses. Still more grave would be the creation of obstacles by authority through a fear that humble voters would have to suffer in the impending alterations of processes.

## THE ORIGIN OF OPERA IN FRANCE.

By Dr. JOHN E. BORLAND.

(Concluded from page 53.)

MONOPOLIES, however profitable to their owners, are seldom or never of advantage to other interests. Two forms of monopoly were connected with French opera in the seventeenth century, one being the patent which, as we have seen, was granted to LULLY for the production of the operas, and the other the privilege accorded to the BALLARD firm as printers. This turned out disastrously for the typographic art. Having no opposition, the BALLARDS did not trouble to renew their music-type often enough, and the result was many poor specimens of opera-scores, in which irregularity of alignment and indistinctness of impression were notable features. But BALLARD prospered, as did LULLY. The latter also was that rare combination—man of affairs as well as artist. His successful ballets and operas provided him with the means of speculating in houses and land in the best suburbs of Paris; his successful speculations gave him capital for further operatic ventures. M. EDMOND RADET, in his valuable work, "Lully, Homme d'Affaires, Propriétaire et Musicien," writing as an architect, draws a happy picture of the association of music with architecture in connection with LULLY's ventures. He writes:—

The myth of Amphion building the walls of Thebes to the strains of his golden lyre has always charmed us. We find in the harmony of sounds presiding over the harmony of the lines of architecture a mysterious agreement which satisfies at the same time our professional taste and our ardent love of music.

Thus, when a happy circumstance put into our hands the care of the ancient Hôtel de Lully in the Rue Sainte-Anne, we seized with eagerness the opportunity of making several sketches of the old stones and some researches about the old musician who had raised them, like Amphion, thanks to his songs.\*

On another page M. RADET writes:—

Like all celebrated men in brilliant epochs of art, Lully . . . has left his trace in all the arts of his time. Painting, engraving, sculpture and architecture offer to us interesting artistic manifestations which he has provoked, or which his reputation has rendered valuable. In the domain of architecture we find especially his house and his tomb.

Architect readers will find matter of absorbing interest in M. RADET's handsome volume. At this moment we must content ourselves with his summary of LULLY's property in houses, lands and movables. These he estimates to have reached the enormous total value, for those days, of 800,000 livres. Of silver LULLY possessed at his death 16,000 livres, of precious stones 13,000, fifty-eight sacks filled with Louis d'or, "Doublons d'Espagne" and many securities for investments. He died at the early age of fifty-four years, as a result of a slight injury to his foot caused by his own conducting staff. His illness was of brief duration, and his will, made in those last days, showed by its exactness the clear-thinking man of business, as well as the considerate husband and father, who desired to give little trouble in the settlement of his affairs. "One sees," says M. RADET, "that to his last breath LULLY was *l'homme de tête et de sang-froid* which he had been all his life."

The Lullian monopoly, we have seen, kept other composers out of the opera-field—for there were others—but with his death came their opportunity. First appeared PASCAL COLASSE (1636-1709), a pupil of LULLY, who is said to have filled up many of his scores, and who now added four acts and a prologue to a single act which LULLY left on the subject of "Achille et Polyxène." COLASSE wrote a prelude of his own, and had LULLY's overture played only once before the first act. This work, like many under similar circumstances, had little success. No better fate was in store for an opera-

ballet by two of LULLY's sons, "Zéphyre et Flore" (1688), but COLASSE had a great success with his tragedy, "Thétis et Pélée," in the following year, and it was restaged at intervals down to 1750. Many other attempts were made by COLASSE, LOUIS LULLY, MARAIS, GERVAIS, LACOSTE, DESMARETS and CHARPENTIER to fill the place of the great LULLY, but M. LAJARTE'S "Bibliothèque de l'Opéra Français" records but poor success for most of them, while LULLY's best works continued to be produced again and again, so that he not only kept the stage during his lifetime, but remained a serious rival to successors after his death. The finest musician in this group was undoubtedly MARC-ANTOINE CHARPENTIER (born 1634), but he despaired of rivalling the great monopolist, and only one opera is placed to his credit, namely "Médée," which had a single performance in 1693, and the composer devoted himself mainly to the service of the Church. He had been a pupil of the great CARISSIMI, and his Motets show him to have had serious aims.

It was about ten years after LULLY's death when the younger composers, so long prevented from gaining practical experience, were able to break away from the Lullian thralldom. The year 1697 marks the beginning of a new epoch. There was no revolution to take place, for the LULLY model was too firmly established to be cast aside easily, and composers still continued on the same main lines; but important modifications were introduced. ANDRÉ CAMPRA'S "L'Europe Galante" was the first of a long series of operas of a new type, having the flimsiest of plots or sometimes no plot at all, each act or "entrée" being complete in itself. These "spectacles coupés" were somewhat like the lighter kind of musical comedies of the present day, inasmuch as they could be altered to an unlimited extent to suit changing fashions. CAMPRA began life as a Church musician, and for a time found it necessary to conceal his identity under a brother's name, when he took to writing for the stage, on account of the prejudice of the clerics against the theatre. A popular rhyme of the day runs—

Quand notre archevêque saura  
L'auteur du nouvel opéra  
M. Campra décampa.  
Alleluia.

However, in a short time CAMPRA was able to become independent of Church patronage through the enormous success of his operas, and more especially the famous "Fêtes Vénitiennes," which made its first appearance in 1710 and held the stage for nearly fifty years, achieving no less than thirty performances so late as 1759. CAMPRA had a real gift of melody, especially of the light, piquant variety, and his treatment of the orchestra was varied and skilful. He was undoubtedly the most gifted of the composers of the intermediate period, and it is pleasant to add that he was so far unspoiled by his success that he warmly advocated the cause of RAMEAU, who in his early days met with much opposition on account of his innovations. When questioned as to his opinions on RAMEAU's opera "Hippolyte," he replied, "There is stuff enough in it for ten operas; this man will eclipse us all." A good example of CAMPRA's lighter vocal style is the soprano air in "Les Fêtes Vénitiennes," "Accourez, hâtez-vous." A specimen of his more sustained style is the air "Seuls confidents de mes peines" in "Iphigénie en Tauride" (1714), an opera which had been planned and commenced by HENRI DESMARETS (1662-1741). The story of this collaboration is a romantic one. DESMARETS in his youth had been a page at the Court, and apparently belonged to a somewhat higher social grade than most of his colleagues. Having married a lady of position secretly and without permission, he was condemned to death, but managed to escape into Spain, where he took service as maître-de-chapelle to PHILIP V. It was during this enforced absence that CAMPRA took up his unfinished work. The items contributed by the respective composers are carefully distinguished in the published score.

\* The house still stands for our inspection at the corner of the Rue Sainte-Anne and the Rue des Petits-Champs, and a commemorative tablet has just been placed upon it.

ANDRÉ CARDINAL DESTOUCHES (1672-1749) was another able composer who owed assistance to CAMPRA, whose pupil he was. His career also was a varied one. Originally destined for the Church, he nevertheless accompanied a diplomatic mission to the King of SIAM, and on his return changed his vocation a second time, for he entered in 1692 the second company of the "Mousquetaires du Roi," and in this capacity took part in the siege of Namur. His final change of career took place in 1712, when he became "surintendant de la musique du roi, et inspecteur-général de l'opéra." He held these posts from 1712 to 1721, and also was director of the opera from 1728 to 1730. His most successful operas were "Issi" (1679), "Omphale" (1701), "Callirhoë," and (in association with LALANDE—1657-1723—famous also for his Church Motets) the extraordinarily successful *ballet-du-roi*, "Les Éléments" (1721), ten performances of which were given so late as 1780. At the first production the king himself (LOUIS XV.) appeared in the ballet, and the *Gazette de France* kindly remarked that "His Majesty danced with much grace." Some of the stage directions in "Les Éléments" are fairly exacting. In the prologue:—"The stage represents Chaos. It is a mass of clouds, of rocks, of waters immobile and in suspense, of fires issuing from volcanos. . . ." Later:—"Fire ascends to its sphere, the clouds are spread out, trees covered with flowers and fruits issue from the earth, and at the two wings of the stage are discovered the Gods of the Elements, namely:—*Of the Air*, Juno, Æolus, Sol Aurora; *of the Fire*, Vesta, Vulcan, the Cyclops; *of the Water*, Neptune, Thetis and Sirens; *of the Earth*, Cybele, Ceres, Bacchus, Pomona, Flora."

One other composer of this group demands more than a passing word. MICHEL PIGNOLET DE MONTÉCLAIR (1666-1737) was a member of the opera orchestra for some years, and two facts in his opera career mark him out for special mention. One was his bold stage-setting of the Biblical story of "Jephthah" (1732), which was reproduced at intervals down to 1761. In this the classic deities appear in the prologue, but are appropriately chased from the scene by Truth and the Virtues—an ingenious method of retaining the conventional prologue with a certain amount of justification. The book was by the Abbé PÉLLEGRIN, to whom RAMEAU was later indebted for similar service. Notwithstanding an attempt to interdict its performance by the Archbishop of PARIS, "Jephté" had a great success. The other matter upon which MONTÉCLAIR's fame rests was his introduction of the double-bass into the opera orchestra. The large viol had held its place in France longer than elsewhere, and an interesting note occurs in the score of MATHO's "Arion" (1714), indicating that "M. DE MONTÉCLAIR, M. THÉOBALD and two serpents are to play the bass part an octave lower." This was apparently the first attempt at the French Opéra to obtain the effect of the modern contra-bass, which provides the "sixteen-foot" fundamental tone of the orchestra. It is now generally stated, though not absolutely proved, that the true contra-bass probably first appeared in MONTÉCLAIR's own opera, "Les Fêtes de l'Été," in 1716.

The year 1733 was an important one for French opera, for it saw the appearance of JEAN PHILIPPE RAMEAU's (1683-1764) "Hippolyte et Aricie." M. LAJARTE says that the work "provoked astonishment rather than enthusiasm among the listeners at the first performance. The public of that period could not understand at first hearing the close-packed harmonies of RAMEAU and the loftiness of his style, after the platitudes which the successors of LULLY and CAMPRA had offered. Nevertheless we find in the *Mercure de France* a clear proof of the success which the work had obtained. . . . 'The opera of "Hippolyte et Aricie" continues with great success and appears ever more tasteful; but we believe that one would see here an air with pleasure.'" CAMPRA's appreciation of "Hippolyte" has already been quoted, but the librettist, the Abbé PÉLLEGRIN,

showed his approbation in something more solid than words. He had made RAMEAU sign a bill for 500 livres as security against the failure of the opera, but was so delighted with the music that he tore it up at the end of the first act. In general features "Hippolyte" stood indebted to the school of LULLY. We find an overture in the usual form, then a mythological prologue, then the repetition of the overture, as in LULLY's works. But already there are indications of change, especially in the orchestra, and it is said that some bigoted members of the band did their best to make the opera fail by deliberately playing wrong notes. The fact is that RAMEAU's score not only gave them more to do but contained so much of new idiom that it was troublesome to players who had been accustomed so long to conventional models. One beautiful number from this opera is still heard on the concert platform in France, and has lately been sung at a Philharmonic concert in London by Madame MARCHESI. This song, "Rossignols Amoureux," is accompanied by obligato flute and violin.

RAMEAU's first undoubted success was "Castor and Pollux" (1737). A number of instrumental movements have had the advantage of a modern reprint, and show the musician to have been possessed of a fertility of resource both in melody and in variety of scoring which is in strong contrast to the comparative monotony of the overtures and dances of the LULLY period. "Les Fêtes d'Hébé" (1739) also contains much fine writing, and LAJARTE says with justice that "this score of RAMEAU's is ravishing from one end to the other. It is truly inconceivable how it should be so little known to artists and to the public even in the form of detached pieces."

To RAMEAU belongs the credit of having endeavoured to make his overtures a true foreshadowing of the dramas which they preceded. In this he anticipated GLUCK. In RAMEAU's "Naïs" the overture was an attempt to represent in tones a combat of Titans; in "Platée" a forest scene is depicted, with cries of animals and voices of birds. In "Zoroastre" (1749) RAMEAU used a good deal of music which was originally written for his unfortunate early opera, "Samson," performance of which had been interdicted on account of its subject, notwithstanding that MONTÉCLAIR's "Jephté" was allowed a hearing. RAMEAU himself gave a description of what he intended to represent by the overture to "Zoroastre":—

The first part is a powerful and pathetic picture of the barbarous power of "Abramane," and the groans of the peoples whom he oppressed; a sweet calm succeeds—new hope is born. The second part is a smiling and lively image of the beneficent power of "Zoroastre," and of the happiness of the peoples whom he has delivered from oppression.

RAMEAU was laughed at for indulging in such ideas, but his theories were in the main adopted by GLUCK, BEETHOVEN, WEBER and WAGNER, and now after 160 years composers seem to find the possibilities of the programme in music still unexhausted. "Zoroastre" called forth so much opposition that a casual reader of the history of the time would almost be justified in writing it down a failure. Nevertheless, the following paragraph appeared in the pages of a contemporary journal:—

A gentleman presented himself at the fifth performance of "Zoroastre" and asked for a seat in the boxes, in the balcony, in the amphitheatre, in fact, anywhere. He was told that all seats were occupied. "This," said he, "is the strangest thing I have ever experienced in my life. I cannot enter a house in Paris without hearing something horribly bad about this opera; yet I have come four times already without getting a seat. The French are the only nation in the world capable of such a contradiction."

RAMEAU was unlucky in arousing much opposition throughout his career. In his early days he had to face the jealousy of the followers of LULLY. When success

came to him he had to pass through the troublesome time of the "Guerre des Bouffons," when an Italian troupe of players divided musical Paris into hostile camps. JEAN JACQUES ROUSSEAU also deserted the national cause and wrote strongly in favour of the Italian party. He said:—

I believe that I have shown that there is neither rhythm nor melody in French music, because the language is not susceptible of it; that French music is only a perpetual barking, unbearable by ears not hardened to it; that its harmony is brutal, without expression and fit only for the exercises of novices; that French airs are not airs at all, French recitative is not recitative. From which I conclude that the French have no music, and cannot have any; or if ever they do have it, it will be so much the worse for them.

The value of such condemnation is discounted when we remember that ROUSSEAU was musically only a half-educated person, who could see no good in a form of art which passed his own comprehension and who even had the temerity to assert that no human ear could appreciate two simultaneous melodies. RAMEAU replied to his outburst, indirectly but effectively, by means of a pamphlet exposing the numerous important mistakes made by ROUSSEAU in his paragraphs on music in his encyclopædia.

RAMEAU lived down all opposition of his early and middle years, and, indeed, lived long enough even to see his own innovations lose their newness. His chief failing had been in under-estimating the value of a first-rate operatic libretto. He thought good music was strong enough to bear the weight of the poorest of plots told in the most wretched style, and he is said to have once remarked that he could set the *Gazette de Hollande* to music. LULLY, a far less able musician than RAMEAU, and labouring under the disadvantage of living two generations earlier, never made this mistake, and a great deal of his success was due to his long association with his exceptionally capable librettist, QUINAULT. RAMEAU saw something of his mistake in his last days, and is reported to have said to the Abbé ARNAUD:—

If I were twenty years younger, I would go to Italy and take Pergolesi for my model, abandon something of my harmony and devote myself to attaining truth of declamation, which should be the sole guide of musicians. But after sixty one cannot change; experience points plainly enough the best course, but the mind refuses to obey.

After RAMEAU, opera in France lost much of its distinctiveness and became more cosmopolitan, but in the period (roughly 1650 to 1750) which we have outlined it was a self-contained branch of art possessing peculiar interest for all students of the development of music and the drama. In these days of elaboration it is refreshing to contemplate in the old scores the attainment of admirable and sometimes surprising effects with musical resources so comparatively meagre. Since effect in all arts depends upon proportion more than upon absolute size, it is not all gain that our schemes of harmony and of instrumentation have now long exceeded the wildest dreams of the earnest masters of seventeenth and eighteenth-century music-drama.

The Council of the Royal Institute of the Architects of Ireland have unanimously passed the following resolution:—The Council desires to place on record its opinion that when the conditions governing any architectural competition have been brought before the Council, and it has felt compelled, in the interest of its members and the public good, to condemn such conditions as inequitable, and has notified the members of such condemnation, any action of a member of this Institute in acting as assessor, competing, or in any way countenancing the conditions of competition which the Council has already condemned is hostile to the best interests of the profession.

## IRISH ARCHÆOLOGY.

THE papers read before the Royal Society of Antiquaries of Ireland are generally interesting, and those found in the latest number of the Proceedings are no exceptions. They differ vastly in character from the essays and books which were written by the antiquaries of the eighteenth and the early part of the nineteenth century. Ireland could not then be regarded as a very important part of the world. But an effort was made to compensate for the shortcomings of the time by imagining the glories of the past. Theories were therefore accepted which now excite amazement. The language of the people was supposed to correspond with that spoken in the Garden of Eden. It was demonstrated that the Irish belonged to some of the tribes of Israel—that they were Etruscans, Asiatics, Iberians, &c. There was much in the old annals which favoured such views, and the mysterious round towers could be interpreted as creations which lent themselves to a variety of strange creeds. The metalwork and illuminated manuscripts were also supposed to have belonged to a very remote age.

Modern investigations have shown how baseless were the majority of the old theories. But it is very hard for a people like the Irish to give up illusions which help to nourish their self-esteem. Although the Norman invasion took place more than seven centuries ago, STRONGBOW and his men continue to be hated. The wrongs they committed are increased when an attempt is made to prove that the Irish were unable to build in a scientific or artistic manner until they had been instructed by Welshmen and other strangers who followed the Norman warriors. The late Mr. STREET endeavoured to palliate the prejudices of an Irish audience by saying that their best examples of ecclesiastical architecture illustrated the manner in which art was carried from land to land in the Middle Ages. He found in them unmistakable marks which proved they were erected by the same workmen and from designs by the same architects as English and Welsh buildings. He offered as an excuse that England in turn derived its architecture from the Continent, and the Irish were therefore only obeying an universal law and should be content, like other men, to be cosmopolitan in their lack of invention.

It will, perhaps, be more difficult to accept the conclusions of Mr. GODDARD ORPEN as expressed in a paper which he read before the Society of Antiquaries of Ireland in March. According to him the earthworks, which are numerous in Ireland, have as much claim as the cathedrals of Dublin and Kilkenny to be accepted as the works of the Normans. His rude unveiling, he admits, dissipates many a fond delusion. According to Mr. ORPEN, the moats "were not the graves of Tuatha de Danann nor of Firbolg; nor, except in late popular imagination, were they the palaces of the Sidhe. They were not the duns of demi-gods, nor even of the chieftains of Celtic tribes. They found no place in the raths or cashels that surrounded our early monasteries; nor were they the robber-dens of Vikings from over the sea. They were simply essential parts of the earthworks of early Norman castles, and, in the vast majority of cases at least, were erected for the purpose by the Normans themselves."

The conclusions should not probably be accepted in the widest sense. The raising of earthworks as a means of defence was a very early practice of men in most parts of the world. The work did not require much constructive skill, and with simple implements earth could be excavated along the lines of a square or a circle and heaped into a mound which became a defensive barrier. In most parts of Ireland forts and raths are to be seen, and Ordnance maps are studded with them. They were not always looked on as primitive defences, but as enclosures more or less natural, on which the fairies were accustomed to hold their revels.

Papers by Mr. T. H. WESTROFF are supposed to represent the popular theory by which some of the moats are

held to date from the Bronze Age, and which Mr. ORPEN opposes. In Scotland it was also at one time believed that the Scottish moats were likewise very ancient, although examination would suggest a more moderate origin. Mr. ORPEN says he has taken fifty-two Irish "townlands" in which the word mote or moat forms a part of the name, and he found they corresponded with districts in which Anglo-Norman invaders lived. The word "brittas" is also used as a part of other names of townlands, and it would seem to be derived from the old French "Bretesche," signifying some sort of wooden tower. The word occurs in the names of thirty-seven townlands—all in early Norman-invaded districts. Other evidences were sought, and confirmed his belief that the moat was wholly or partly artificial, and served as an elevation on which a castle could be erected. Unfortunately it is impossible to find an example which would be manifestly convincing to sceptics, owing to causes which Mr. ORPEN describes in the following words:—

As might indeed be expected, a fortress of the kind above described, with all its earthen defences complete, has seldom or never survived the chances and changes of centuries. Reconstructions under different military conditions would alter some features. This would almost necessarily be so when an Edwardian castle, or one built as a large court with four or more round towers, but without a keep, was constructed on the same site. Even the mound in such a case would be removed. In growing towns the whole incumbrance would be cleared away for the sake of the space. Often ditches would be filled up and defences levelled as an act of war, even when it would take too long to level the moat. Improving agriculturists would often obliterate at least the baileys. When a moat was shaped out of a hillock of gravel, road contractors and others have often carted it more or less completely away. Indeed we probably owe the survival of so many moats to the well-known superstition—for the existence of which, in the absence of higher motives, we antiquaries may be thankful—which deters the Irish peasant from "interfering with them ould things at all."

Under such circumstances it is almost impossible to arrive at any definite conclusion. We see a square keep in ruins on a slight elevation above the surrounding fields. But the angles which may at one time have given shape to the substructure can no longer be defined. The earthen mound originally may have presented an appearance which corresponded to the laws of fortification as laid down by the Norman VAUBANS. Yet as nearly all the characteristics are obliterated by time and neglect, who can now say whether the Normans did not avail themselves of earlier raths or forts? They would do so not only for the sake of economy of labour and of time, but because it was quite possible that the earlier people who constructed the earthworks were also invaders who selected the most eligible positions for defence. It may be true that the forts when they are excavated do not always afford evidence that they were burial-grounds or places for worship like Druidic circles. However, the same obscurity prevails in regard to the earthworks of other countries. Traditionary beliefs must be sacrificed in such cases. No doubt it would be an historical gain if it could be established that the moats were Norman creations, for it would show how backward were the Irish in a simple class of work if compared with other peoples. It would also be plain that the Normans did not restrict themselves to a comparatively few safe districts, but were enabled to rule in reality as well as in name over the greater part of the island. But there is no more uncertain material for archaeological discussions than clay. Just as a cutting or embankment on one Irish railway corresponds in slope and appearance with that of another railway, although there may be a period of half a century between them, in the same way a Norman mound and a prehistoric mound cannot differ much in material or in form. Nevertheless, Mr. GODDARD ORPEN's paper is interesting not only for its subject, but as an indication of the

manner in which modern Irish archæologists deal with puzzles. In the old days everyone could say "I imagine," and was satisfied. Now each archæologist, like MONTAIGNE, seems to have a pair of scales as an emblem, with the motto "Que sçais-je?"

Another instance is seen in the Rev. St. JOHN SEYMOUR's paper on "Abbey Owney." There are legends about the place from prehistoric times, and an abbey was founded in the district in 1189 or 1205. Many records exist concerning it. But although a rather elaborate sketch of the buildings as they existed in 1681 is evidence of position, the author of the paper believes that the site must be located in a different position from that generally accepted.

Mr. WESTROPP describes some of the old castles in the county of Limerick. There will be found testimony to the inability of the old buildings to resist artillery such as it was in the sixteenth century. Whether great or small, the castle or peel towers were reduced to ruin. From various old manuscripts sketches are given of the buildings, and the wonder is some were able to hold out so long. Mr. H. S. CRAWFORD in his "Descriptive List of the Early Irish Crosses" gives a model of a manual to guide an archæologist in a special subject. The crosses of the different counties are entered systematically, the locality where they are to be found, the number of the survey map on which they are marked, and a short account of each of them is supplied, with a reference to descriptions which have appeared in various publications.

#### SCIENCE IS MEASUREMENT.\*

LORD KELVIN in 1871 made a statement from the presidential chair of the Association at Edinburgh as follows:—"Accurate and minute measurement seems to the non-scientific imagination a less lofty and dignified work than the looking for something new. But nearly all the grandest discoveries of science have been the reward of accurate measurement and patient, long-continued labour in the minute sifting of numerical results."

Besides the instances quoted by Lord Kelvin in support of that statement, we have perhaps as remarkable and typical an exemplification as any in Lord Rayleigh's long-continued work on the density of nitrogen which led him to the discovery of argon. We shall see presently that, true as Lord Kelvin's words are in regard to most fields of science, they are specially applicable as a guide in astronomy.

One of Clerk Maxwell's lectures in the natural philosophy class at Marischal College, Aberdeen, when I was a student under him there, in the year 1859, ran somewhat as follows:—

"A standard, as it is at present understood in England, is not a real standard at all; it is a rod of metal with lines ruled upon it to mark the yard, and it is kept somewhere in the House of Commons. If the House of Commons catches fire there may be an end of your standard. A copy of a standard can never be a real standard, because all the work of human hands is liable to error. Besides, will your so-called standard remain of a constant length? It certainly will change by temperature, it probably will change by age (that is, by the rearrangement or settling down of its component molecules), and I am not sure if it does not change according to the azimuth in which it is used. At all events you must see that it is a very impractical standard—impractical because if, for example, any of you went to Mars or Jupiter, and the people there asked you what was your standard of measure, you could not tell them you could not reproduce it, and you would feel very foolish. Whereas, if you told any capable physicist in Mars or Jupiter that you used some natural invariable standard, such as the wave-length of the D line of sodium vapour, he would be able to reproduce your yard or your inch, provided that you could tell him how many of such wave-lengths there were in your yard or your inch, and your standard would be available anywhere in the universe where sodium is found."

That was the whimsical way in which Clerk Maxwell

\* From the presidential address by Sir David Gill at the opening of the meeting of the British Association in Leicester on Wednesday.

used to impress great principles upon us. We all laughed before we understood; then some of us understood and remembered.

Now the scientific world has practically adopted Maxwell's form of natural standard. It is true that it names that standard the metre, but that standard is not one-millionth of the Earth's quadrant in length, as it was intended to be; it is merely a certain piece of metal approximately of that length.

It is true that the length of that piece of metal has been reproduced with more precision, and is known with higher accuracy in terms of many secondary standards than is the length of any other standard in the world; but it is, after all, liable to destruction and to possible secular change of length. For these reasons it cannot be scientifically described otherwise than as a piece of metal whose length, at 0 deg. C. at the epoch A.D. 1906, is equal to 1,553,164 times the wave-length of the red line of the spectrum of cadmium when the latter is observed in dry air at the temperature of 15 degs. C. of the normal hydrogen scale at a pressure of 760 mm. of mercury at 0 deg. C.

This determination, recently made by methods based on the interference of light waves, and carried out by MM. Perot and Fabry at the International Bureau of Weights and Measures, constitutes a real advance in scientific metrology. The result appears to be reliable within one ten-millionth part of the metre.

The length of the metre, in terms of the wave-length of the red line in the spectrum of cadmium, had been determined in 1892 by Michelson's method, with a mean result in almost exact accordance with that just quoted for the comparisons of 1906; but this agreement (within one part in ten millions) is due in some degree to chance, as the uncertainty of the earlier determination was probably ten times greater than the difference between the two independent results of 1892 and 1906.

We owe to M. Guillaume, of the same International Bureau, the discovery of the remarkable properties of the alloys of nickel and steel, and from the point of view of exact measurement the specially valuable discovery of the properties of that alloy which we now call "invar." He has developed methods for treatment of wires made from this alloy which render more permanent the arrangement of their constituent molecules. Thus these wires, with their attached scales, may, for considerable periods of time and under circumstances of careful treatment, be regarded as nearly invariable standards. With proper precautions we have found at the Cape of Good Hope that these wires can be used for the measurement of base lines of the highest geodetic precision with all the accuracy attainable by the older and most costly forms of apparatus; whilst with the new apparatus a base of 20 kilometres can be measured in less time and for less cost than one of a single kilometre with the older forms of measurement. . . .

The ancient philosophers were confident in the adequacy of their intellectual powers alone to determine the laws of human thought and regulate the actions of their fellow men, and they did not hesitate to employ the same unsupported means for the solution of the riddle of the universe. Every school of philosophy was agreed that some object which they could see was a fixed centre of the universe, and the battle was fought as to what that centre was. The absence of facts, their entire ignorance of methods of exact measurement, did not daunt them, and the question furnished them a subject of dispute and fruitless occupation for twenty-five centuries.

But astronomers now recognise that Bradley's meridian observations at Greenwich, made only 150 years ago, have contributed more to the advancement of sidereal astronomy than all the speculations of preceding centuries. They have learned the lesson that human knowledge in the slowly developing phenomena of sidereal astronomy must be content to progress by the accumulating labours of successive generations of men; that progress will be measured for generations yet to come more by the amount of honest, well-directed and systematically discussed observation than by the most brilliant speculation; and that, in observation, concentrated systematic effort on a special thoughtfully selected problem will be of more avail than the most brilliant but disconnected work.

By these means we shall learn more and more of the wonders that surround us and recognise our limitations when measurement and facts fail us.

Huggins's spectroscope has shown that many nebulae are not stars at all; that many well-condensed nebulae, as well as vast patches of nebulous light in the sky, are but inchoate

masses of luminous gas. Evidence upon evidence has accumulated to show that such nebulae consist of the matter out of which stars (*i.e.* suns) have been and are being evolved. The different types of star spectra form such a complete and gradual sequence (from simple spectra resembling those of nebulae onwards through types of gradually increasing complexity) as to suggest that we have before us, written in the cryptograms of these spectra, the complete story of the evolution of suns from the inchoate nebula onwards to the most active sun (like our own), and then downward to the almost heatless and invisible ball. The period during which human life has existed on our globe is probably too short—even if our first parents had begun the work—to afford observational proof of such a cycle of change in any particular star; but the fact of such evolution, with the evidence before us, can hardly be doubted. I most fully believe that, when the modifications of terrestrial spectra under sufficiently varied conditions of temperature, pressure and environment have been further studied, this conclusion will be greatly strengthened. But in this study we must have regard also to the spectra of the stars themselves. The stars are the crucibles of the Creator. There we see matter under conditions of temperature and pressure and environment, the variety of which we cannot hope to emulate in our laboratories, and on a scale of magnitude beside which the proportion of our greatest experiment is less than that of the drop to the ocean. The spectroscopic astronomer has to thank the physicist and the chemist for the foundation of his science, but the time is coming—we almost see it now—when the astronomer will repay the debt by wide-reaching contributions to the very fundamenta of chemical science.

By patient, long-continued labour in the minute sifting of numerical results, the grand discovery has been made that a great part of space, so far as we have visible knowledge of it, is occupied by two majestic streams of stars travelling in opposite directions. Accurate and minute measurement has given us some certain knowledge as to the distances of the stars within a certain limited portion of space, and in the cryptograms of their spectra has been deciphered the amazing truth that the stars of both streams are alike in design, alike in chemical constitution and alike in process of development.

But whence have come the two vast streams of matter out of which have been evolved these stars that now move through space in such majestic procession?

The hundreds of millions of stars that comprise these streams, are they the sole ponderable occupants of space? However vast may be the system to which they belong, that system itself is but a speck in illimitable space; may it not be but one of millions of such systems that pervade the infinite?

We do not know.

"Canst thou by searching find out God? canst thou find out the Almighty unto perfection?"

**The Lord Provost's Committee** of Edinburgh Town Council considered proposals for the buildings of the new Art School. The estimates already accepted amount to 33,236*l.*, and it is estimated that unlet contracts will amount to 7,589*l.*—in all, 40,825*l.* The proposals submitted will, it is estimated, involve additional cost for concrete floors, with increased height of rooms, and the extra expenditure on foundations will amount to 3,400*l.* The proposed expenditure for embellishment of the buildings amounts to 8,900*l.* The proposals will bring the total cost up to 53,176*l.* The committee agreed on a division to recommend the Council in favour of the increased expenditure.

**The Bill** of the National Trust for Places of Historic Interest or Natural Beauty was before the House of Commons Committee on Unopposed Bills last week. Mr. Cripps (Parliamentary agent) said the object of the Bill was to dissolve and reincorporate the trust now incorporated under the Companies Act. As owners of property they would have the ordinary right to admit or exclude the public, and therefore it followed that if there was right of public access there should be some right of control to prevent any wrongdoing, destruction or defacement of property, and with those objects the clauses of the Bill were framed. Of course the incorporation of an association under the Companies Act, not for profit, was not a satisfactory position, and therefore the members asked for incorporation as a statutory body. The Bill was ordered to be reported to the House for third reading.

## NOTES AND COMMENTS.

WITH so large an undertaking as the construction of a new roadway between Holborn and the Strand it was hardly possible to determine the character which the buildings were to assume. One example of a difference of opinion about the treatment has arisen. By an exchange of properties a site at the south-east corner of Kingsway and Great Queen Street became the freehold of Sir WILLIAM JAMES FARRER. In the agreement with the County Council it was provided that he would not "build on the said lands or any part thereof any buildings except such as with regard to their elevations next the said new street shall be in accordance with plans to be first submitted to and approved by the architect for the time being of the Council, the object being to secure reasonable harmony in the elevations of the various buildings which will front on the said new street." Since this agreement was drawn up the building conditions in this respect have been remodelled and the approval of drawings, &c., in such cases is now vested in the Council. All the buildings erected up to the present time on the area of the Holborn to Strand improvement are of Portland stone or granite, and to erect a building in brick with stone dressings, as proposed by Sir WILLIAM FARRER, it is thought, would be an infringement of the agreement, as it would not be in harmony with those erected or to be erected. The improvements committee say that some consideration is due to the owners and lessees who have already erected buildings in Kingsway and Aldwych faced with Portland stone. If brick be allowed for Sir WILLIAM's building they may reasonably complain that such action would be detrimental to their interests. Sir WILLIAM seeks to make his new building conform to the design of that in Lincoln's Inn Fields, but the provisions of the agreement do not require harmony of design with buildings in Lincoln's Inn Fields, but with the buildings in Kingsway. Several sets of drawings of the buildings proposed to be erected on the site have been submitted, but the improvements committee have not recommended the Council to approve any of the proposed designs. It is now proposed that the questions at issue should be referred to arbitration by Mr. T. G. JACKSON, R.A., and Sir WILLIAM FARRER agrees to this. Each party is to be represented before the arbitrator by only two professional gentlemen, each party is to pay its own costs of the arbitration proceedings, and the arbitrator's fees and the costs of the award are to be borne equally by the Council and Sir WILLIAM.

A NEW society has been formed in Paris called "Les Amis du Muséum." It is not intended to be a rival or a co-operator with "Les Amis du Louvre," who have enriched the national collections with important works of art. The new body will, for the present at least, have only one object in view, and that is the erection of buildings in the Jardin des Plantes. French designers owe much to the care taken in disposing of plants for their special service. As long as vegetation is considered to be the basis of ornament, there is no place in Europe which is better adapted to suggest fresh possibilities of treatment. Designers would not regret if the gardens served no other purpose. But we must remember that from the beginning of the eighteenth century natural history in a wide sense was recognised. BUFFON was one of the officials. The renowned researches of CUVIER were carried out in some of the buildings, and the Jardin des Plantes became not only a school for physiology but a zoological garden. It was possible to keep the gardens in an advanced condition and adapted to modern requirements without any extraordinary outlay. But theatres for operations, laboratories, museums, require constant outlay. It could not be concealed that industry was always promoted by the expenditure on zoology, whilst botany was closely connected with a vast number of the trades and callings in France. The

buildings in consequence have been neglected, and it must be owned they do not suggest at the present time either the wealth or the love of science in France. Several years ago M. BLAVETTE prepared plans for the reconstruction of existing buildings and the erection of others which would be worthy of Paris. But, although they were approved, successive Governments have declined to ask for votes by which money could be obtained. The "Amis du Muséum" propose to act in the emergency by subscribing sufficient sums to enable the buildings to be placed in a presentable condition. As may be imagined, to overcome the neglect of sixty years will be expensive. But it is expected that wealthy Frenchmen will be generous in their contributions.

FROM the annual report of the Ruskin Museum committee it appears that the collections in Sheffield during the past year were visited by 42,024 people. The Sheffield Ruskin Club held its monthly meetings of the Meersbrook Circle at the museum, as in previous years, and between thirty and forty meetings of the different circles have been held in the city during the year. The members of the club meet to read and discuss the works of JOHN RUSKIN with the view of ascertaining how his teachings may be applied for the betterment of social relations and conduct at the present day. The work now being dealt with is "Fors Clavigera," being letters to the labourers and workmen of Great Britain, whilst the books which have been carefully considered and studied in the past include "The Eagle's Nest," "Unto this Last," "The Two Paths," "Time and Tide," "A Joy for Ever," "Munera Pulveris," "Sesame and Lilies," "The Seven Lamps of Architecture" and "The Crown of Wild Olives." Two lectures were delivered by the curator, Mr. GILL PARKER, on RUSKIN's life and work and two on TURNER and RUSKIN.

THERE have been consultations of painters, experts and officials in order to ascertain whether it is possible to repair *POUSSIN's Deluge*, which was lacerated by a man whose intellect is doubtful. The paint was laid on very thinly by the artist, and an operation sometimes performed of separating the canvas from the work is in consequence rather doubtful. An experiment will be tried with one of the corners. To reline the painting would not be difficult. But it is feared that sooner or later the lines of the cutting would become visible. What is to be most feared is that other paintings may also be made the victims of the discontent of individuals. After the Portland Vase was broken in the British Museum a law was passed by which vandals who committed similar misdeeds were liable to be flogged. The fear of such a consequence has done more to save works of art in public galleries than an increased number of keepers. France, however, is more lenient owing to the excitability of the inhabitants.

DURING several years the Galerie des Machines, which at one time was supposed to be as remarkable an effort of French construction as the Eiffel Tower, has been alternately condemned and rescued. It seemed to be strange that use could not be found for so large a covered area. Last week it was expected that the tenders for the materials would be considered by the Municipal Council, and that one of them would be accepted. But at the last moment the State has intervened, and decided to purchase the large hall from the city of Paris. It will be taken down and removed to the exercise ground at Issy. But it is not likely to be monopolised entirely for military purposes. It can still be used for agricultural and other exhibitions. But it will no longer be an obstacle to those who desire to see the Champ de Mars transformed into a picturesque addition to the city. By one happy stroke the enemies, as well as the friends, of the great hall are satisfied, and the Government have acquired a valuable place for military exercises of various kinds without much cost to the country.

CATHEDRAL SERIES.—SOUTHWARK: THE NEW HARVARD CHAPEL.  
(ST. JOHN'S CHAPEL.)

WE are told that some men are born great, others achieve greatness, while some have greatness thrust on them. The words expressed the belief in SHAKESPEARE'S time. It might be added, as expressive of the practice in later times, that a fourth class can attain extraordinary greatness by purchase on moderate terms. The Rev. JOHN HARVARD, M.A., by the expenditure of 800*l.* obtained renown which will be as enduring as that of Mr. CARNEGIE, which represents an outlay of over a thousand times as much. For not only the greatest of American colleges—or rather universities—bears his name, but the old chapel of St. John in Southwark Cathedral is now a memorial of him. It should be remembered that, when dying at Charlestown in 1638, he left one-half of his modest fortune, with his books, to the college for the education of English and Indian youth in knowledge and godliness, which was then recently founded. He was not more than thirty years of age, and had only one year's experience of the new Puritan colony.

JOHN HARVARD was the son of one of the tradesmen of Southwark and was duly baptised in the church of St. Saviour. His father attained the dignity of a vestryman—a body which at that time used to meet at the chapel of St. John, a part of the cathedral which suffered many vicissitudes. It was not only used as a vestry-room, but it also served as a small debtors' court. The graduates of Harvard desired to have some memorial of their founder in the cathedral. Accordingly they contributed generously towards the restoration of what is henceforth to be known as the Harvard chapel. If they desire they may look upon it as a chapel for their special use. Among the subscribers were Mr. JOHN RIDGELY CARTER, Mr. CHOATE, the late American ambassador (who gave the window), Mr. PHILLIPS, Mr. J. PIERPONT MORGAN, Mr. CARNEGIE, Mr. BRADLEY MARTIN and Mr. WHITELAW REID. Information concerning JOHN HARVARD will be found in Canon THOMPSON'S history of the cathedral.

CATHEDRAL SERIES.—SOUTHWARK: THE GOWER MONUMENT.

MODERN publishers, by issuing cheap editions, have prevented many of the early English poets from being enjoyed only by a very few scholars. They have not dared to reprint any of the works of JOHN GOWER, although his friend and contemporary, GEOFFREY CHAUCER, has been accessible to all for a great many years. JOHN STOW in the sixteenth century had the courage to bring out an edition of CHAUCER, but he avoided GOWER. Yet the early poet had one remarkable chance of gaining popularity. The play of "Pericles," though not found in the first folio, was supposed by some to have been SHAKESPEARE'S earliest attempt as a dramatist—"SHAKESPEARE'S OWN muse his PERICLES first bore." Each of the five acts is introduced by a sort of prologue or speech which was spoken by GOWER in chorus. The reason was that GOWER was the first to relate the strange story. In 1576, when SHAKESPEARE was a boy of twelve, a book was published called "The utterne of Painfull Adventures," in which GOWER'S story is given; and in 1608 the story was again printed evidently for purposes of comparison with the play. It neither in the Elizabethan nor subsequent ages was possible to make GOWER'S poems popular.

Although a contemporary of CHAUCER, it is uncertain whether GOWER was older or younger than the greater English poet. It is believed he was a lawyer, and it was supposed that he rose to be Chief Justice of the Common

Pleas. His principal poem, the "Confessio Amantis," is thought to have been composed at the suggestion of RICHARD II. STOW says he was an especial benefactor at the time St. Mary Overy was rebuilding. According to him the poet was "buried on the north side of the said church, in the chapel of St. John, where he founded a chantry: he lieth under a tomb of stone, with his image, also of stone, over him: the hair of his head, auburn, long to his shoulders, but curling up, and small forked beard; on his head a chaplet, like a coronet of four roses; a habit of purple, damasked down to his feet; a collar of SS gold about his neck; under his head the likeness of three books which he compiled. The first named 'Speculum Meditantis,' written in French; the second 'Vox Clamantis,' penned in Latin; the third 'Confessio Amantis,' written in English."

Near GOWER'S tomb three figures of virgins were painted on the wall, but they have long since vanished. They held devices on which prayers in Norman-French for the repose of the poet's soul were inscribed. His arms were also emblazoned with an epitaph in Latin. Whether he was one of the Yorkshire GOWERS or of a Kentish family could not be inferred from any inscription.

## OIVINGDEAN CHURCH.

IN seclusion among the Downs the very ancient parish church of Ovingdean, although not forgotten by ecclesiologists, is apt to be overlooked by the ordinary traveller. Yet it has many claims to notice, not the least being the simplicity of its design and its perfectly harmonious surroundings. On the south a side chapel is known to have formerly existed, its destruction somewhere about the fourteenth or fifteenth century being laid to the charge of French marauders.

The old foundations having recently been uncovered the chapel has now been rebuilt, and not only has the new work very closely followed the original design, but, by direction of the architect (Mr. C. E. Clayton, of Messrs. Clayton & Black), the builders have selected and used their materials with such care that harmony is at once established between the new and the old in tone, colour and appearance. The windows and decorations in Ovingdean Church are by the late Mr. C. E. Kempe (who was recently buried in the churchyard), and his successor, Mr. Tower, is supplying a beautiful little window for the chapel.

A very interesting archæological discovery, says the *Sussex Daily News*, has been made during the rebuilding. The remains (a few stones only being apparent) of a low side window—one notable feature in this church—existed. The careful removal of some flintwork and plaster now unexpectedly reveals the almost unspoilt splayed window opening complete with all the stonework intact, even the limewash on the sides being fresh and untouched, and traces of ironwork still in position. Fragments of a rude stone piscina have also been found. It has been suggested that the relics of St. Wulfran, to whom the church is dedicated, who was Bishop of Abbeville, across the Channel, may have been kept here. This is not improbable, for there seems little doubt that this old parish church, although now "dreaming among the hills," was once of importance, and may have been a place of consequence on the way from the coast to the great priory at Lewes.

Mr. Justice Grantham summing up at the Leeds Assizes on Saturday in an action in which the owner of property adjoining the works of the Kirby Banks Screw Company, Ltd., Leeds, sought an injunction to restrain the company from continuing an alleged nuisance in the shape of smoke and grit emitted from the works, said that Leeds had the character of being the most smoky town there was. There was no place that he went to where the volume of smoke was so great as it was there. It was passing strange to him why manufacturers allowed the enormous waste of power that there was by not consuming the smoke more than they did. It was idle to say it could not be done, because it had been done. It seemed to him that the people had got so used to the smoke nuisance that they took no notice of it. The injunction sought was given, and his Lordship granted a stay of execution.

## ROYAL ARCHÆOLOGICAL INSTITUTE.

It is fitting that Colchester, "the home of antiquaries" and the oldest town in the realm, should be chosen for a prolonged visit from the Royal Archæological Institute of Great Britain and Ireland.

The annual meeting was held last week. The Mayor and Corporation received the members at the Moot Hall. The Mayor said:—I need hardly say that it affords me a great amount of pleasure to preside over this gathering to-day. Thirty-one years have elapsed since this distinguished Society honoured this borough with a visit, and during that long period I am sure Colchester has lost none of her historic interest. On the contrary, her antiquarian richness is ever bringing to light fresh phases for admiration relating to her past most interesting history. On the occasion to which I have just referred I note that an apology was made because we had no cathedral here to show you. I hope that when next this honourable Society visits Colchester we shall be in the proud position of having attained that. I am sure I am voicing the feelings not only of the members of my Council, but of every inhabitant of this ancient borough, when I say that we most sincerely trust your visit will not fail to afford you an even larger amount of intellectual pleasure and satisfaction than when you last honoured us with your company.

Alderman Laver followed with a cordial welcome from the Essex Archæological Society. The Mayor had referred to the Royal Institute's last visit in 1876. There was now far more thought and attention given and more value placed on the antiquities with which they were so richly furnished. Where at that time there was one in the town who cared for the antiquities surrounding them and who wished for their preservation, to-day there were many, and he was sure the greater part of Colchester viewed with considerable pride the antiquities which were left to them.

Rev. T. Curling, hon. sec. of the Essex Society, said much water had flowed under the bridge since the last visit, and the change which had since then come over the attitude of the general public towards the pursuits in which they as societies were particularly interested was a marked one. To-day, even those whose interests lay in other directions were as well disposed towards the intelligent study of the antiquities of their own country as men always were towards the study of those of Classic lands. None the less, however, was the visit of the Institute to this county calculated now, as formerly, to give a stimulus to local antiquaries and to enhance, in alien eyes, the value of their researches. It was still, perhaps, true that the restorer of ancient buildings sometimes worked with a zeal which was not according to knowledge, but on the whole he ventured to think that the influence of the Institute and the Society of Antiquaries, from the loins of which it sprung, was with each succeeding year spreading more widely and producing greater and more beneficial results.

Sir Henry Howorth, the president of the Institute, said there is no town within these realms that can compare with Colchester in the fact that it is the oldest recorded town that we know of at all in the country. It has maintained its beauty, it has maintained its prosperity and it stands out still on this wonderful hill which first caused it to become a British settlement; after all these centuries it remains still, not only the home of antiquaries, but one of the places in these realms which has produced, down to our own time, some of the most distinguished and accomplished antiquarians that we have known.

Mr. James Round, P.C., expressed his indebtedness for the honour the members of the Royal Archæological Institute had done him by electing him President of this annual meeting. Although it was some thirty-one years since the Society came to Colchester, he felt he was no stranger to this learned body, because he could remember, in company with the late Lord Carlingford and the late Sir Thomas Western—two of the most respected men of that day in Essex—taking part in offering a welcome to its members on that occasion. He was sure it had given Colchester, and the county generally, very great pleasure to have the meeting this year in this town.

*Copford Church.*

The first excursion, says the *Essex Telegraph*, brought the members to Copford Church, where Mr. Laver explained that this interesting building was an example of an Early

Norman church, built entirely with the remains of Roman buildings. It had at one time a vaulted roof, over the top of which was the residence of the priest. Outside, it pointed out the bricked-up doorway by which the priest entered his dwelling, some 15 or 16 feet from the ground. At an early English period the church was not quite big enough, so some holes were cut through one of the walls as was often done, and a piece was built on the side, with the result that the pilasters, which were formerly outside the church, were now inside. Over the top of one of the arches thus created was one of the original Norman windows, with a painting in it, which had not been touched. It had been filled up with rubbish for a very long time, but unfortunately the colouring had very much faded. The old church was painted everywhere where it had the vaulting over. Many of the figures, especially the apse, had been repainted over the same lines and with the same colours, so that it was really a restoration. At one time the south door had been transferred to the north and a new door, with a porch, had been erected, which thought was a pity. The door, which had been removed, had been covered with human skin—no doubt the skin of some man who had suffered for sacrilege! Mr. St. John Hope added some remarks, by no means complimentary to the "restorer," who had destroyed the historical value of the painting by filling in, from his own imagination, the signs of the zodiac in the chancel, and putting in some "silly angels."

*Laver Marney.*

To Laver Marney was an easy journey, and at Laver Marney Towers Mr. St. John Hope gave a brief history of the grand old hall, the erection of which was begun by Sir Henry Marney, afterwards Baron Marney, about 1520. He died in 1523, and the building was carried on by his son, who, however, did not live long enough to finish it. The Marneys then becoming extinct, the hall remained unfinished. Sir Henry Howorth added that the mansion was a tremendous national treasure, and he hoped it would long remain in the hands of the present owner, Mr. W. M. de Zoete, who seemed to be taking great care of it. The church was then visited, and proved a most interesting place, as admirably described by the Rev. H. J. Boys, rector. The church was noteworthy for the alabaster tomb and effigy of Sir William Marney, who died in 1414, and for the terra-cotta tomb with effigies of Henry Lord Marney, who commenced the building of the hall, who died in 1523, and his son, John Lord Marney, who died in the same year. The party were hospitably entertained to tea on the beautiful lawn in front of the Hall by Mr. De Zoete, and were afterwards permitted to view portions of the house, which is full of treasures in the way of carving, pottery and painting. Hearty thanks were accorded to Mr. De Zoete for his kindness.

*History in Musical Instruments.*

The first evening lecture in the Moot Hall was on "The Instruments of Music figured and portrayed in the artistic productions of the Middle Ages." With this subject, ably handled, Rev. F. W. Galpin provided an hour's delightful entertainment. With his unique collection of musical instruments, such types as are depicted in carving and stained windows in the cathedrals and churches of our land he described the development of stringed, wind and pulsating instruments. He also played on them quite deftly so as to give an idea of the times, and familiarised the audience with the harp, psaltery, dulcimer, flute, hurdy-gurdy, shawms, horns, the sackbut and the cymbals. He showed, too, the development as evidenced in present-day instruments, and with merry tune made the Morris dance and rural revivals live again. He fully justified the claims of this branch of archæology, and said in these silent stones depicting instruments of the long ago they found sermons which the ordinary passer-by failed to read, and much modern prejudice disappeared in sympathy with the living past.

*Little Maplestead Church.*

Little Maplestead Church has the distinction of being one of four similar churches in the whole country owing its peculiar design to the fact that it belonged to the Knights of St. John of Jerusalem, and was probably built at the end of the thirteenth or beginning of the fourteenth century. The entrance to the church is through a small porch into an octagonal nave, in which are six peculiarly carved pillars which support the tower. Round the outside of the pillars runs the circular aisle, which gives the church a remarkable appearance. The chancel is apsidal and is also very quaint and beautiful. Mr. St. John Hope

maintained the features of the church. The venerable Judge Baylis added some observations, and Sir Henry Howorth rendered the thanks of the party to the vicar, the Rev. J. F. Harward, who, he mentioned, had occupied that position for fifty-two years.

#### *Great Maplestead Church.*

The party proceeded to Great Maplestead Church, which is cruciform in shape and exceedingly quaint. The vicar, the Rev. A. F. Evans, met the visitors, and supplemented the remarks of Mr. St. John Hope with some curious facts. Sir Henry Howorth described it as "a little church in which almost every treasure from the twelfth century onwards is represented." The chancel is beautifully decorated.

#### *Castle Hedingham Church.*

A pleasant drive brought the visitors to Castle Hedingham, where after lunch at the Bell Hotel a move was made to the church. Mr. St. John Hope explained that this church was one of which they would like to have the history, but like a great many others, it had no history, except what the stones could tell them. By the ornaments on the north porch, he should fix the date of the church as of the twelfth century. There had been some later work of brick, including the tower, which he praised highly, pointing out, however, that the date 1616 placed on a stone recording the name of the master builder only referred to some repairs to the tower, as it must be of earlier construction. The badges over the west window in the tower all seemed to point to John de Vere, Earl of Oxford, who died in 1513. One was a representation of a bo'sun's whistle, such as was carried by bo'suns in the reign of Henry VIII., with a chain to it, put there because he was Lord High Admiral; the next was a jack or winch, because his name was John; then came the De Vere mullet, then the chain of state, because he was Lord Chamberlain, then an ox crossing a ford, then a boar and another peculiar thing (like the wing of a bird) of heraldic meaning.

#### *Hedingham Castle.*

At the other side of the village the castle keep, a delightful place, provided abundant interest. The keep for centuries formed part of the home of the ancient De Veres, who came over with the Conqueror, and who are represented even at the present day, through the female line, in the family occupying the handsome modern structure close by the grand ruins of the twelfth-century stronghold. It also possesses a fine old church, full of interest to the antiquarian; and, under the guidance of the President, Sir Henry Howorth, Mr. W. Hale Hilton and also Mr. St. John Hope, the attractions of this beautiful spot became doubly interesting.

#### *The Colchester Charters.*

Mr. W. Gurney Benham, J.P., of Colchester, at the evening meeting described "The Town Charters of Colchester." He mentioned that he had arrayed before him the Red Book, the Red Parchment Book, the Court Rolls extending over 500 years, the Sessions Roll extending over three centuries, and numerous other books and documents—so many, indeed, that one might wander for forty years in his wilderness without exhausting its resources. The documents were alive with human interest and human problems, and Mr. Benham extracted from them much that was entertaining, from the "fullest possible measure of home rule" and the privilege the burgesses enjoyed to hunt the pole-cat, given under the charter of Richard I. in 1189 to much later date. The Oath Book, he said, contained over 100 oaths of varying length and strength. We make our mayor and town clerk swear—sometimes with good reason, he explained—and we make them take ancient oaths which their predecessors in office took, although they are inappropriate to the duties of the office in modern times.

Sir Henry Howorth remarked that these charters had been most carefully examined and arranged, and taken the greatest care of by the exemplary town.

Mr. Benham replied that as one of the ruling body of the town he appreciated those remarks, but the awakening of the interest of the Council and the town generally to the importance of its antiquities was very much due to Alderman Henry Laver, who had been a member of the Council for a great number of years, and had a way of impressing his views upon his colleagues they did not care to ignore. The present modern Council of Colchester, he added, though unable to do things quite in the same simple way as their predecessors managed them, was very jealous of its ancient rights and privileges of the town, very zealous in the preservation of its records and very desirous that so far as

money would allow—and the wholesome fear of the rate-payers permit—these records would gradually be transcribed and printed and published faithfully and fully, which after all was the only effectual way of making sure of preserving these records for posterity.

Mr. Laver, who was called upon to make a speech, expressed pleasure that the efforts he had made to preserve these precious documents had had some effect, and he was very hopeful that the town recognised that they were doing a good work in preserving these records, and he hoped before many years the whole would be translated and published.

A paper on "The Essex Sackvilles" was to have been read by Dr. Horace Round, but to the regret of the members he was not well enough to attend.

#### *Inworth and Coggeshall.*

On Thursday the Coggeshall country was visited. Inworth Church was inspected, and at Coggeshall the fine fifteenth-century church of St. Peter ad Vincula, a full account of it being given by Mr. G. F. Beaumont, F.S.A., formerly hon. secretary to the Essex Archæological Society. After lunch at the Chapel Hotel, the whole party visited Paycocke's House, which has become one of the great show places of Coggeshall. They were received by the Rev. Conrad and Mrs. Noel.

#### *Bradwell Church.*

Bradwell Church was the next place at which a call was made, and the visitors were greatly delighted with this quaint and interesting structure, which was ably described by the Rev. T. H. Curling, a former rector. It is a Norman edifice, and contains the remains of a fine rood-screen, some old stained glass and mural paintings, with some curious memorials of the departed. On the way to Faulkbourne Hall the party visited the mammoth barns at Cressing Temple, and at Faulkbourne Hall found a most imposing example of a brick mansion believed to have been built in 1439 by Sir John Fortescue, and held by the Bullock family from 1637 until eight years ago. The visitors were hospitably entertained by Mr. and Mrs. Christopher W. Parker.

#### *Dr. Gilbert's Birthplace.*

At the evening meeting at the town hall Dr. J. Horace Round, in a paper on "The Carrington Legend" dealt exhaustively with the question of bogus pedigrees; and in a second paper, "A Note on Dr. Gilbert," the famous Colchester worthy, he examined historical records concerning Gilbert's birthplace, and as to the identity of the house in which he lived. He was not sure, however, that he really lived at the Trinity Street Tymperleys. Dr. Round was heartily thanked for his interesting papers.

#### *Colchester Castle.*

There was a very large muster at the castle, where an admirable description was given of the building by Mr. St. John Hope. It was difficult to realise, he said, that when the Institute met here in 1876 there was still a violent quarrel as to the Roman origin of the castle. After the meeting, Mr. Butler wrote a pamphlet upholding the theory of Mr. Jenkins and others that the building was purely Roman from top to bottom, was the temple of Claudius and several other things. But now we knew better, and that it was erected about 1100 in the vicinity of some Roman remains, the materials of which were used in its construction. As to the suggestion that Eudo Dapifer built the castle, that was clearly disproved by the Chartularies, one document in which—of about the year 1100—showed that Eudo's father and brother had held it before it was given to Eudo, and that brought it back to the Conqueror, so he hoped henceforth they would hear no more of Eudo being the founder or builder of the Colchester Castle. Mr. Hope referred to the sale in 1683 to John Wheeley, who began to pull it down, and the ruins he left were sold to Sir Isaac Rebow. The castle eventually came into the family of Mr. Charles Gray, from whom it descended to Mr. James Round. Mr. Hope next exhibited plans of the Tower of London and Colchester Castle; he showed the great similarity, and suggested that if the London keep was dignified with the Tower of London why should not Colchester Castle, which was bigger, be known as the Tower of Colchester?

The lecture was supplemented by Dr. Horace Round and Sir Henry Howorth.

#### *Round Colchester's Walls.*

In the afternoon, Dr. Laver conducted a larger party than usual in a circuit of the town walls at Colchester, starting from St. Mary's Steps. He pointed out that there

were  $1\frac{3}{4}$  miles of Roman walls remaining and the gate and guardroom on Balcerne Hill were very rare, as only two portions of Roman gates remained—at Colchester and Lincoln. As to the date of the walls, according to Mr. Duncan they must have been built not later than the earlier half of the second century. Inside the wall was a great bank of earth which covered up burnt houses, probably remains of Boadicea's revolt. On Balcerne Hill Dr. Laver pointed out the fine stretch of wall he rescued from the Improvement Commissioners of early days, who were going to tumble it down in order to make up the road. The Abbey Gate, St. Botolph's Priory and Trinity Church were inspected in the course of the journey.

### KELSO ABBEY.\*

EARL DAVID, afterwards King David I. of Scotland, was so attracted by the fame of St. Bernard that he journeyed to Tiron, near Chartres, in France, greatly desiring to stand in his presence. St. Bernard died in 1117 and David arrived only to kneel at his tomb. Before leaving Tiron he arranged that twelve monks and an abbot of the reformed Order of Benedictines should go to Scotland, where he placed them at Selkirk, close to his own forest home. The exact date of the foundation is unknown. Radulph, the first abbot, returned to Tiron in 1117, and William, his successor, followed him in 1119. Herbert, the third abbot, received the king's permission, with the advice of John, the first bishop of Glasgow, to remove the abbey from its unsuitable site at Selkirk in Glasgow diocese, to Kelso on the Tweed, in the diocese of St. Andrews. The abbey was founded at Kelso on May 3, 1128, in the presence of the king and queen and their son, the Bishops of St. Andrews and Glasgow, an archdeacon, two priors, &c. It was dedicated to the Virgin and St. John the Evangelist. The Bishop of St. Andrews granted to the abbey the church of St. Mary at Kelso, and allowed the abbot and convent to get "crisma" and oil and ordination from any bishop in Scotland or in Cumbria. The abbey was free from all episcopal jurisdiction and dues.

Abbot Herbert became bishop of Glasgow in 1147. His successor, Abbot Arnold, who became bishop of St. Andrews in 1160, carried forward the building of the abbey. The work was sufficiently advanced to receive the body of Henry, the Earl of Northumberland, the only surviving son of King David, who died on June 12, 1152. Interesting miniature portraits in colour of King David and his grandson Malcolm IV. are preserved in the great Charter granted by Malcolm to the abbey in 1159. Abbot John obtained from Pope Alexander III. in the year 1169, for himself and his monastery, the privilege and precedence of a mitred abbey.

The abbeys of Arbroath and Kilwinning were derived from Kelso, and Lindores, Lesmahagow and Fyvie were bestowed upon it. It received so many gifts in lands that it became one of the richest foundations in Scotland. The abbots, who took precedence of all other ecclesiastics of their rank, were frequently employed upon the king's business beyond the realm. The abbots of Melrose and Kelso passed to Rome in the year 1181, and secured from Pope Lucius III. the removal of the excommunication passed upon Scotland, and brought home the golden rose to King William the Lion.

This pape send wyth thir abbotys twa,  
Thare leve quhen thai tuk hame to ga,  
To the Kyng Williame of Scotland  
A rose off fyne gold rycht plesand.

David de Bernhame, the great Bishop of St. Andrews, who devoted so much of his time to the dedication of churches throughout the country, and who dedicated the abbey church of Kelso on March 27, 1243, died in the year 1252, and was buried in the abbey.

The Byschape Daivy off Bernhame  
Past off this warld till his lang hame;  
As he dyd here syne fand he thare  
Off hym I byd to speak no mare.  
He chesyd hys layre in till Kelsew  
Nocht in the Kyrk of Saint Andrewe.

The abbot of Kelso, with the abbots of Melrose, Jedburgh and Dryburgh, swore fealty to Edward I. of England on August 28, 1296. Edward, on August 8, 1299, permitted the monks to elect a devout abbot in the place of Friar

Richard, a rebel and enemy, who had wilfully absented himself. The abbot, probably the same Richard, was seized to the king's peace on September 24, 1300. Edward, Prince of Wales, offered 4s. 8d. on May 26, 1303, as oblation at the mass at Kelso. On February 16, 1304, King Edward signified to the abbot and convent his pleasure that they receive Friar Peter, a monk of Kelso, whom he had previously requested the prior and convent of Norwich to receive into their house during the Scottish war. Friar Peter had petitioned the king to let him return to Kelso "for the monks of Norwich were not of his religion or of the same service."

The abbey suffered greatly in the War of Succession. It was so completely ruined that the monks and novices went among the other religious houses begging for food and clothing. King David II. granted the monks leave to wood in the forests of Selkirk and Jedburgh for its repair, and Edward of England issued letters of protection for restitution of property.

It was during the reign of James I. that priority of place in Parliament and in Council above the abbot of Kelso was adjudged to the prior of St. Andrews. James III., then only nine years old, was crowned king of Scotland in 1460, and the abbey of Kelso on August 16, 1460. The abbey was repaired in 1487, and in 1488 it was visited by James IV.

The abbey was destroyed in September 1545. The Marquis of Hertford assaulted it. Cannon were brought up and a breach was made in the walls. The garrison took refuge in the town, but was afterwards captured and the abbey won. The English commander decided to turn it into a fort, from which to overawe the country. He reported that "we devised thereupon with the Italian fortifier that here—Archam, and the master mason of Berwick; when we had spent all the day thereabouts we found nothing so difficult that, in our opinions, it seems impossible to be done within the time that we can tarry about it." The besiegers found the ruins "so great and superfluous buildings of stone" that unless pulled down and removed "the heaps of stones, besides the confusion of the materials, should remain an enemy to the fortress; and to make the fortress so large as should contain all those superfluous buildings should be so confused and long work as cannot be perfected in a great time." The idea of building a fortress at Kelso was revived by the queen regent of Scotland, but was never carried out.

Kelso was conferred upon Sir Robert Ker of Cessford in 1590.

The part of the abbey which had not been hopelessly destroyed, the part which still remains, was afterwards repaired and restored for Divine worship. The date of restoration, 1647, is carved near the top of the north transept gable. A small part of the building was converted into a prison.

The Chevalier was proclaimed King of Scotland at Kelso in 1715. The commander of the Jacobite forces gave orders on October 23 that all the men should attend Divine service "not at the Episcopal meeting-house," but at the "Great Kirk of Kelso." The Highlanders were again at Kelso in 1745.

Some fragments of plaster fell from the ceiling of the church about the year 1771, and it is reported that the congregation, fearing the fulfilment of a reputed prophecy of Thomas the Rhymer that the kirk would fall at its full, deserted the building. The present parish church was built in 1773. The abbey ruins were cleared in the year 1805, and in 1866 they were repaired by the Duke of Roxburghe.

The ruins of the abbey consist now of two sides only—a tower of commanding height, which measures internally about 22 feet 6 inches. It is supported by four tall piers clustered shafts with pointed arches. To the north and south of the tower are aisleless transepts, with large turrets at the angles of the gables. The transepts are about 18 feet long, divided into two bays. Of the building which projected to the west of the tower only the north wall and one half of the west gable remain. The part, which measures about 22 feet 6 inches by 21 feet 3 inches, was the same height as the transepts. The building to the east of the tower was about 62 feet broad, divided into three aisles. The north and south walls have almost entirely disappeared, but two piers and two arches of the arcade between the centre and the south aisles are preserved. The piers are cylindrical on plan with small attached shafts on the south to carry the aisle vault, and the east and west to carry an inner recessed arch. There are no other piers in Scotland of this design.

\* From a paper by P. Macgregor Chalmers, F.S.A., published in the *Kelso Mail*.

The low vaulted building to the south of the transept gave access to the cloister, which extended along the south of the three-aisled building.

Fragments of richly decorated work of a later period are preserved in Dr. Rutherford's garden.

The design of the west front is unique in Scotland. The transept walls are the same height as the main wall of the three-aisled building, and are divided into four storeys. The lower storey was decorated with arcading, the arches interlacing; the three upper storeys had each two round-headed windows, those in the second and third storeys having detached shafts in the angles of the jambs. The buildings were covered with high pitched roofs, whose lines can be traced upon the tower walls. The interior was covered with flat panelled timber ceilings. The piscina in the south-east corner of the south transept indicates that an altar stood against the east wall.

When the abbey was founded in 1128 a pure Norman style was in use. But the Norman characteristics of the work which is preserved are so largely mixed with details of Transitional type that the date cannot be earlier than about 1160. The upper part of the tower was built about 1200.

The portions of the abbey church which have been preserved are at present understood to be a nave about 22 feet square, north and south transepts of smaller dimensions, a central tower and part of a three-aisled choir. If this is a correct interpretation then the church of Kelso instead of being one of the greatest of our Mediæval abbey churches was one of the smallest. The building was then strangely disproportioned to the important part which the abbot and convent played in the nation's history.

It is many years since my attention was drawn to the subject by Mr. D. C. Macvail, St. James Terrace, Glasgow, who remarked upon the similarity between the remaining portion of Kelso Abbey and the west front of Ely Cathedral. I had not visited this cathedral at the time, but its design was sufficiently known to appreciate the value of the suggestion.

I visited Ely two years ago. Many points of resemblance were noted. The western tower of Ely stands upon the medial line of the cathedral and is of commanding height. It is built upon four great piers with pointed arches opening to the centre aisle of the nave, to a north and a south transept, and, in the original design, to a western arm similar to the transepts. This western arm was rebuilt as a galilee porch and upper room at a later time, but the remaining fragments of the original structure are of the same date as the tower and transepts. The transepts are two bays in length with great turrets at the angles, divided by string-courses. The lower part is of plain ashlar, two orders of wall arcading follow, then a window storey with a band of wall arcading above, under the upper windows. The interior is covered with flat panelled timber ceilings. There is a semicircular apsidal chapel on the east side of the south transept. The chapel of the north transept has been destroyed. The piers of the nave are designed alternately as a cluster of shafts and as cylinders, with small shafts attached to the one side to carry the aisle vaulting and to form a line of division between the bays of the arcade on the other. The Norman style of the west front is of advanced type, and details characteristic of Transitional work are freely introduced. It was built about the year 1160.

The description of this work at Ely Cathedral corresponds with that of the west front of Kelso Abbey. The resemblance is so close that the conclusion appears inevitable that the designer of the Scots building owed much to his knowledge of its magnificent southern contemporary. The architect of Kelso may have come from Ely.

It is unfortunate that the published records of the English cathedrals are not available for study in Scotland. I made inquiry at Ely, but for the present I cannot say if there is any reference in the cathedral documents to the abbey of Kelso or its founders. Ely is not mentioned in the "Liber de Calchou."

The opinion may be entertained from the above descriptions that the remaining fragment of Kelso Abbey is only the west front—a western tower with north and south transepts, used as chapels, and a western porch, the whole forming a galilee. The three-aisled building was the nave extending eastward to a great choir.

During the summer of last year I visited Kelso several times on business. Through the kind offices of Mr. Bruce, builder, I secured the interest of the provost and magistrates of the town, who readily granted me permission to dig in

the ground outside the area of the graveyard, under the supervision of Mr. Hume, the burgh surveyor. This was done on June 29, 1906. Mr. Tait, to whom at the outset I submitted a sketch of what I supposed to be the plan of the original abbey church, informed me that the part of the building I referred to as the choir was at the present time a narrow detached strip of burial-ground enclosed within walls on the north, east and west, and by a large public school on the south. It was known locally as "The Aisle," and contained several monuments of considerable age.

Careful measurements were taken of the walls and pillars. Then the workmen dug at every available point until they reached undisturbed gravel. No stones of any size were discovered, but the material thrown out was always broken shivers of freestone and lime. The foundation-stones may have been removed in the laying of drains and gas and water-mains, many of which were discovered—some long since disused and unexpectedly brought to light—or it may be that the foundations as well as the walls and pillars have been appropriated to the buildings in the town. The abbey was used as a quarry for many years.

An ancient ashlar wall, about 4 feet thick and lying in the direction of north and south, was destroyed when the public school was built. A stone pavement and a sarcophagus, now preserved at the west end of the abbey, were also discovered. The builder of the school, Mr. W. Dickson, assisted me to take the measurements of the wall. When these were laid down on a plan drawn to scale, together with the plan of Ely Cathedral, it was found that by adding five bays to the existing two bays on the east of the tower, and making the nave seven bays long and then setting off an arch equal in width to the centre aisle of the nave and thus indicating the position of a central tower, the ancient wall was exactly in line with the last pier added, that is, the eastern pier of a crossing. I conclude that the old wall which was destroyed was the east wall of the south transept, or of the building which extended from the south of the transept to form the east side of the cloister garden.

It is possible that the sarcophagus was found within the lines of the chapter-house.

If there were eastern transepts of the width of the centre aisle of the nave and choir, the piers at the crossing probably supported a tower, as at Ely Cathedral. The piers would be designed with clustered shafts similar to the piers supporting the western tower. That piers of this character did exist is proved by an engraving made by Slezer in 1693.

If the narrow enclosed burial-ground, known as "The Aisle," is now accepted as indicating the position and dimensions of the choir, the abbey church emerges as a great transeptal church with a splendid west front, with a great tower, a great three-aisled nave of seven bays and a central tower and transept. It is impossible to determine the plan of the choir; but the suggestion may be offered that the original structure was designed with a semicircular apse, and that this apse was removed at a later time and the choir lengthened and terminated with a square end. From the evidence which has now been adduced we find that the total internal length of the abbey was 302 feet. It ranks as the second longest church in Scotland, being only exceeded in length by the cathedral church of St. Andrews.

The design of the west front of Kelso Abbey, of which so much happily remains, is the finest and most impressive in Scotland, worthy of its great founder and of its splendid history. Its source may with good reason be found in the contemporary design of Ely Cathedral.

## CUBICAL EXTENT OF BUILDINGS.

THE Building Act committee of the London County Council report that they have recently received a deputation from the London and District Association of Engineering Employers, who urged that steps should immediately be taken to remove the restrictions as to cubical extent imposed by the London Building Act, 1894. The deputation stated that these restrictions made it almost impossible for engineering firms to carry out their work in London in accordance with modern requirements, that many firms had already removed their works from the county, and that others would be compelled to follow their example unless the restrictions were removed without delay. The committee are of opinion that the restrictions press very severely, not only on the engineering trade, but also on many other trades and businesses in London, and are supported in this view by the fact that applications are

frequently made to the Council for permission to erect buildings of the warehouse class exceeding 450,000 cubic feet, which under the present law the Council is unable to grant. In connection with these applications it is strongly represented that the limit of 450,000 cubic feet has the effect not only of embarrassing trades and businesses in London, but of preventing important and essential developments rendered necessary by modern commercial methods. Moreover, it is pointed out that such restrictions do not obtain in other towns.

The committee think that the difficulty would best be removed by amending the London Building Act, 1894, so as to give the Council full discretion to allow buildings to be erected of such cubical extent as may be in its opinion reasonable. The principle was adopted by the Council on November 15, 1904, upon a report on the London Building Acts (Amendment) Bill, 1905, but the necessary amendments of sections 75, 76 and 77 were contained in that portion of the Bill which was not proceeded with. In the event of the Act being amended as suggested it would be desirable that a statement should be drawn up and adopted by the Council laying down the principles which would guide the Council when dealing with applications for permission to erect buildings exceeding 450,000 cubic feet in extent. The committee are advised by the solicitor, under standing order, that the Council has power to promote legislation on the subject, and as they are of opinion that the suggested amendments should be obtained with the least possible delay they recommend:—

(a) That the operation of the standing order be suspended in order that the following recommendation may be dealt with:—(b) That application be made in the session of Parliament of 1908, with a view to the amendment of the London Building Act, 1894, as under—(i.) Section 75 to be amended so as to enable the Council to allow horizontal separation. (ii.) Section 76 to be amended so as to remove all restrictions on the Council's power to allow increased cubical capacity for buildings of the warehouse class. (iii.) Section 77 to be amended, on the lines laid down in the London Building Acts (Amendment) Bill, 1905, so as to give the Council discretionary power with regard to openings in party walls, the provision of fire-resisting doors constructed of materials other than iron and the uniting of buildings.

The fire brigade committee recognise the importance of affording all possible facilities for the carrying on of trades and manufactures in London, but in view of the far-reaching effect of the Building Act committee's proposals on the work of the Council, as the authority charged with the duty of protecting life and property in London from the danger from fire, have asked that committee to afford the fire brigade committee an opportunity of considering the matter, and if necessary making representations to them on the subject.

#### SHREWSBURY ABBEY.

THE annual meeting of the Shropshire Archæological and Natural History Society was held in Shrewsbury, Lord Barnard (the president of the Society) being chairman.

The Rev. Prebendary Auden (chairman of the Council) read the annual report. It stated, says the *Shrewsbury Chronicle*, that the work of the Society had been steadily maintained. Two important efforts on behalf of old buildings had been inaugurated and partly carried out under its fostering care. The one was the repair of the tower of Shrewsbury Abbey Church and the other was the excavation on the site of the abbey at Haughmond. The first was a work of imperative necessity for the security of the building, while the second had yielded important results in determining the situation of the various parts of which the abbey was composed. Since the last report the numerous MSS. relating to Shropshire left in a more or less complete form by the late Mr. William Phillips had been purchased at the joint expense of the Society and the committee of the Shrewsbury Free Library, and would be utilised from time to time for the purposes of the "Transactions."

The Chairman proposed the adoption of the report and statement of accounts. The report glided very lightly over two matters which were both of considerable importance. The first was the question of the repair of the tower of the abbey church, a work which must cause a great deal of anxiety to all those who were interested in the state of such a magnificent monument as that, and in fact to all who

were interested in the glorious memorials of the ancient town of Shrewsbury. The cost, as they all knew, had turned out to be a very serious matter. At the same time he believed that the promoters of the restoration work had reduced that cost to the lowest limit possible without scamping the work. He had carried about with him for several weeks the draft of a letter which it was contemplated he should issue to the Press in London appealing for assistance, but his duties recently as chairman of the Departmental Committee on Agriculture had prevented him giving serious attention to the draft, although he hoped that he might now be in a position to further consider the matter. There was another point in connection with the subject, however, which made him hesitate, and that was the enormous number of appeals of every conceivable sort made to the public at the present time. He did not say for one moment that they were not perfectly justified, but the fact remained that unless one had some specially powerful lever to work with, unless one was very careful and took special steps, the response might be very inadequate, and there was a risk that the work one had in hand might be hampered rather than assisted. At the same time, they might rely upon it that he should not let the matter rest, and he would be prepared to co-operate with and welcome the assistance of anyone in Shrewsbury or the county, or anywhere else in the country, who was interested in the preservation of that ancient monument, who would help him or give him any advice as to how an appeal to the public was most likely to touch the hearts of those whose assistance they sought. Another matter which was referred to in the report was the excavation work on the site of Haughmond Abbey, which, as they all knew, was due very largely to an enthusiastic archæologist, and one of their own townsmen, Mr. Southam. They could not be too grateful, he thought, to Mr. Southam for all he had done in connection with that grand old Mediæval building. Their thanks were due to him and to all those who co-operated with him. The noble lord next referred to the losses by death mentioned in the report, and, referring to the position of the Society, expressed a hope that there would be an increase in the number of those who took an interest in it. It had been mentioned that more generous subscriptions were desirable. That was a truism, and was the case with almost every society, but at the same time he hoped they would not let it fall upon deaf ears or treat it as a platitude. For a great number of years that Society had done extremely useful work. The work of archæology was not only of great value to the student of history and to those who wished to study the evolution of the British race as that now existed, but it was also, as they would admit, a most fascinating and engrossing pursuit. To those engaged in other and laborious work it was a most diverting occupation to turn to, and he claimed that it was both useful and recreative. The traditions which clustered round the county and its many ancient buildings provided them all with an admirable study, and he felt that they might look forward with confidence to the future welfare of the Society.

Prebendary Auden, in seconding, said the restoration of the abbey tower was necessary and a very valuable work. In regard to the excavation at Haughmond, they owe practically everything to Mr. Southam, and had it not been for the efforts which that gentleman had put forth the work done would not have been accomplished. Mr. Southam was a modest man, however, and he had not told everyone what he (Prebendary Auden) knew, and that was that he had paid a good deal of money out of his pocket in connection with it. He believed he was right in saying that there was something like 60*l.* unpaid, for which Mr. Southam was presently responsible. He only mentioned the fact so that those in a position to do so might help Mr. Southam in the matter. The Society had had rather more losses by death than usual. They wanted more members, and they wanted more young members. Many of them who had been engaged in that work for a number of years would like to see some of the duties falling on younger shoulders. He ventured to think that the study of archæology brought with it a great deal of pleasure, and he would like to plead with young people to take a deeper interest in the work. As his lordship had said, it was a most fascinating and agreeable pursuit.

The report and accounts were then unanimously adopted.

Prebendary Moss said it struck him that among the many claims archæology had on the public interest there was one which to some extent seemed to have been

forgotten, he meant the claim which it had to interpret the problems of the present day. We lived in such a rushing and hurrying world that there was no little danger that we might be overwhelmed with the circumstances around us. He thought therefore that archæology was not only recreative, but it was informing and enlightening to look back on the past and see how the present had grown out of it. Certainly in Shropshire, with its ancient abbeys and castles and old buildings of various sorts, we had innumerable opportunities of seeing the links which bound us to the past and interpreting their relation to the present. He was confident that the more the past was studied by the light of our archæological remains and in other ways the better we should be qualified to deal with those large problems which pressed upon us every day.

### FURTHER STRAND IMPROVEMENT.

THE Further Strand Improvement Committee held a meeting on Saturday at 54 Mount Street, W., the residence of the Earl of Plymouth, and decided to renew its agitation for the modification of the London County Council's building plan for the Strand frontage of the Aldwych "island site." The committee decided to present to the new London County Council the memorial which was rejected by the old County Council.

Sir Edward Poynter, P.R.A., who presided, said the change which had taken place in the County Council gave them the opportunity of pressing a subject which was of the greatest importance, and they ought not to allow the occasion for making a dignified street in connection with the Holborn to Strand improvements to pass. He understood a portion of the frontage had already been let to some of the colonial bodies for their offices. That, no doubt, gave a new importance to the scheme, and the thoroughfare should therefore be made something worthy of London. If the present opportunity were lost it could never be found again and everyone would hereafter be sorry. He hoped the London County Council would be found willing to receive a deputation and a further memorial on the subject.

The Earl of Plymouth said it was thought of great importance that if they were to approach the new County Council some memorial should be in their hands before the adjournment for the recess. They had now a Council totally different from that which was in office a year or two ago. Since the memorial was presented it had been decided that the frontage of the centre block in the Strand should be occupied by offices of a Colonial Government, a fact which strengthened their case materially. It seemed hardly fair for them to be met with the argument that a very large sum of money—350,000*l.* it was said, but he did not think that amount was adhered to now—would be lost to the County Council if the land they asked for were given up to the streets. He thought they should bear in mind that this was one of the most important roadways in London as far as traffic was concerned, and the nature of the buildings to be erected and the importance which would be given to it by making the thoroughfare as fine and dignified as possible would largely enhance the value of the frontages themselves. He moved:—"That in the opinion of this meeting a clear case has been made against the plan adopted for the land between Aldwych and the Strand; and Colonial Governments having decided to erect Government buildings on the land in question, it is hereby agreed to present another memorial to the London County Council in support of the plan advocated by the Further Strand Improvement Committee, in the hope that the Council will now see that it will be a blot upon the Metropolis if the roadway be not given its natural course direct to and from the Courts of Justice."

Mr. Harold Cox, M.P., in seconding the resolution said the question of expense did not naturally follow, for if they cut off a portion of the frontage they would reduce in proportion the amount of recoupment which the Council would get, because by widening the street they would get better frontages and a better price for the land, which was at present a drug in the market.

Mr. J. C. Paget cited the case of the removal of Temple Bar in illustration of the shortcomings of the authorities when improvements were made. There, he said, the traffic of a wide thoroughfare was brought into a narrow bottle neck.

The resolution was unanimously adopted. The further improvement suggested by the committee is an elimination of the curve in the north side of the Strand between the

churches of St. Mary-le-Strand and St. Clement Danes. This would mean taking a slice off the eastern end of the London County Council's island front and setting back the roadway a few feet. It would enable traffic to proceed in a straight line from St. Mary-le-Strand to the Law Courts.

Mr. Mark H. Judge, the honorary secretary of the committee, had prepared the following statement of the cost of the Further Strand improvement:—

Though the Further Strand Improvement Committee have not dealt with figures in their appeals to the London County Council, for reasons stated, the value of the land proposed to be added to the public way to make the road direct and to form the island pavement was estimated by the late Council at a very high figure indeed.

Before the summer recess of 1903 the improvements committee of the Council stated that the plan advocated by the Further Strand Improvement Committee was "somewhat similar to the one proposed by Mr. Thorneycroft," which they reported would add to the thoroughfare land valued for building purposes at 350,000*l.* On this, at the time, I wrote as follows:—"It would be interesting to have some details as to how these valuations were arrived at. Without details the figures certainly appear to be excessive. To estimate the value by the superficial area only would not give a correct result, as, in such a position, the first consideration of value is the frontage."

In the report of the same committee in October 1903, there were more figures, and for the plan advocated by the Further Strand Improvement Committee the value of the land to be surrendered was then put at 239,400*l.*, a reduction of no less than 110,600*l.* Still, no details were given as to how the valuations had been made. Doubtless these details were given to the committee; why not to the Council in public sitting?

Let me endeavour to get some meaning out of the large figures which have appalled a few persons, and which some apparently hope will appal the ratepayer, and thus perpetuate the blunder which now mars the new Strand.

The building area which would be given up to the public if the Further Strand Improvement Committee's proposal is adopted would be about 12,560 square feet. This, as I have said, the late Council valued at 239,400*l.*—that is, thirty years' purchase of a ground rent of 7,980*l.* per annum. The middle block has an area of about 123,350 square feet, and would therefore, on the above basis, be worth 2,351,113*l.*, or a ground rent of 78,370*l.* per annum. The improvements committee of the Council, however, have recommended, and the Council have accepted, an offer of 55,000*l.* per annum for this block.

Why was the land required for the alteration valued at 42 per cent. higher than the land to be let for building purposes?

The late Council estimated the rental (rateable) value of the 12,560 square feet proposed to be given up to the public at 12,690*l.* per annum if built upon. Now the west block, on which the buildings are completed, has an area of 24,440 square feet, and on the same basis its rateable value would be 24,692*l.* per annum, whereas it is actually assessed as of the total rateable value of only 13,668*l.* per annum. It would be interesting and instructive to be told what ground rent the Council receive for the west block.

The above figures do not take into account the fact that the buildings on the west block were in considerable part built at the cost of the ratepayers. On Tuesday next a little bill of some 6,000*l.* will be presented for payment "in respect of the more costly design or elevation required by the Council for the new Gaiety Restaurant premises." No inducement of a like contribution to the cost of building on the east block has been held out.

Without going into further details, I think I have shown that the late Council's estimate of the financial sacrifice involved in the further improvement asked for is, to say the least, somewhat inflated. But the question of cost was not the real objection, for Mr. Davies, as chairman of the late improvements committee of the Council, spoke in the Council against our proposal in 1903 as follows:—"The new Strand was wider than Northumberland Avenue, and quite adequate for the traffic. With regard to the architectural effect, his committee had not been convinced that the setting back of the frontage would be any considerable improvement, and he asked the Council to support the committee in rejecting the plan advocated by the Further Strand Improvement Committee."

Any less thorough amendment than that advocated in the memorial to be presented to the Council on Tuesday

next would be to follow the penny wise and pound foolish policy of the late Metropolitan Board of Works when laying out Shaftesbury Avenue and Charing Cross Road, which are narrow, second-rate streets, instead of the broad and noble thoroughfares they should have been.

It is to be hoped that the new Council will realise that the questions involved in this proposal are outside the haggling of the market. About 75,000*l.* was spent in improving Tottenham Court Road at its junction with Oxford Street by removing the block of buildings east of what was then Bozier's Court. To begrudge the cost necessary to give the Strand its natural course to and from the Courts of Justice, in connection with an improvement scheme which involves an expenditure of five millions sterling would be discreditable to the intelligence of the Metropolis, and we may surely hope that the new County Council will put matters right by granting the prayer of our memorial.

On behalf of the Further Strand Improvement Committee I have renewed the offer made to and declined by the late Council, viz. to pay the Council 50*l.* for the use of the Strand frontage of the east block for three months, for the erection of a hoarding 30 feet high, in order to demonstrate how buildings on the present line of frontage would mar what would otherwise become the noblest thoroughfare in the Metropolis.

### INSTITUTE EXAMINATIONS.

AT the midsummer examinations of the Royal Institute of British Architects 137 candidates passed the "preliminary," eighty-seven the "intermediate" and thirty-four the "final and special." The following are the names of the last candidates, who are now qualified for candidature as Associates:—Harold Percy Brentnall, Henry Brown, Duncan Walter Clark, William Thomas Clarke, Charles Emerson Clouting, Frederick Edwin Collington, Lawrence Stanley Crosbie, Leonard William Edmonds, George Hartley Goldsmith, Walter Godfrey Green, Alfred Hill, William David Jenkins, Arthur William Kenyon, George Esslemont Gordon Leith, Percy Wells Lovell, Walter Goldstraw Moffatt, Spencer Harris Joseph Murch, Bruce William Oliver, Harry Phibbs, Louis Augustus Phillips, Henry Arthur Porter, John Clifford Proctor, A. Hurley Robinson, Edgar John Scaife, Herbert Marshall Spence, William Stockdale, Robert John Tall, Arthur Tedman, Alfred Dennis Thacker, Bernard David Tracey, William Whitehead, Arthur Reginald Widdowson, Leslie Wilkinson, Samuel Arthur Spear Yeo.

### Ventilation at the New Bailey.

SIR,—It was with some concern that the public must have read Sir Forrest Fulton's strictures as to the want of ventilation of the new Central Criminal Court. Though "Common Sense" is scarcely correct in referring to the "Plenum" system as new, yet I agree cordially with the suggestion that the Corporation shall make inquiries as to possible amendments. But are amendments possible without heavy expenditure being involved? I am of opinion that the system of forced propulsion (and to a lesser extent of forced expulsion) cannot compare favourably with natural means, such as Boyle's or Kite's. To incur heavy expenditure in installing a system that, in its very nature, is complicated and one needing superior attendant labour is to incur a heavy responsibility—I refer to the committee of the Corporation. Natural ventilation will, as a rule, act automatically, but even when induced action is necessary, this can be supplied at a reasonable cost. May I be permitted to refer to an instance within my own experience? A client complained to me of the Egyptian plague of flies to which his bedroom was subjected—the house was an old one, and the room stretched from front to rear. I called in the services of Mr. Robert Boyle, and as a result of the natural ventilation introduced, the flies disappeared as if by magic. Natural ventilation is the triumph of efficiency, moderate first cost and upkeep, as opposed to the heavy burden of the mechanical ventilation as employed in the new Courts.—Yours, &c.,

LIBRA.

### Rownson, Drew & Clydesdale, Ltd.

SIR,—We beg to inform you that, with a view to facilitating the amalgamation of our businesses, and also for family reasons, we have converted the two undersigned firms into a limited liability company, registered under the name of Rownson, Drew & Clydesdale, Ltd. The registered office of the company will be at 225 Upper Thames Street, London, to which address kindly send all communications. All debts and liabilities of each firm will be paid and discharged by the company, and all debts due to either firm are to be paid to the company. No shares are offered to the public. There is no debenture issue. The partners of each of the late firms will continue to take an active share in the management as directors of the company. We thank you for past favours, and trust that the satisfactory relations that have hitherto existed between us will be continued between the company and yourselves.—Yours faithfully,

ROWNSON, DREW & CO.,

THE CLYDESDALE IRON FOUNDRY CO.

225 and 210 Upper Thames Street,  
London, E.C.:

July 31, 1907.

### GENERAL.

**Mr. Herbert Norman**, of Northampton, has been awarded the first place in the competition for a Carnegie library in Northampton. The assessor, Mr. Leonard Stokes, has given second place and a premium of 50*l.* to Mr. F. W. Dorman, third to Mr. A. E. Anderson with a premium of 25*l.* Seventeen local architects competed.

**Mr. Stuart Hill** has been successful in the competition for the workhouse infirmary at Edmonton, which is estimated to cost 152,640*l.*

**Sir George Hayter Chubb** suggested the postponement of the Scottish National Exhibition until 1909, as the Franco-British Exhibition will be held next year in London. The authorities of the exhibition, having once postponed it on account of the Dublin Exhibition, appear to be opposed to the suggestion.

**Mr. Dermot O'Brien** has been elected a constituent member of the Royal Hibernian Academy, of which he has been hitherto an Associate.

The **Exhibition Executive Committee** of the Edinburgh Architectural Association state that the exhibition in the Royal Scottish Academy rooms has met with gratifying recognition, and has been highly appreciated by a large section of the public. They point out, however, that up till now the receipts for admission are not up to the anticipated amount, and exhort the members to send as many friends as possible before the exhibition closes on August 10.

The **Leith Dean of Guild Court** have granted warrant to the Queen Victoria statue committee for the erection of a statue at the foot of Leith Walk. The committee was formed in 1897 to promote the object as a Diamond Jubilee memorial. The difficulties have now been overcome, and the committee have selected a model designed by Mr. Birnie Rhind, R.S.A., Edinburgh.

The **Dean and Chapter of Truro Cathedral** have received from Mrs. Hawkins, of Portland Place, London, a promise of 20,000*l.* for the completion of the western towers and spires of Truro Cathedral. The gift is to be a memorial of the late Mr. C. H. T. Hawkins. The donor requests that any surplus may be applied to the building of a cathedral school for choristers and other boys within the precincts of the cathedral.

**Mr. Dudley Newman**, in addition to other work, is now carrying out the restoration of the chancel of St. Peter's Church, Stetchworth, near Newmarket, for the Right Hon. the Earl of Ellesmere; also some considerable alterations and additions at Fulbourn Manor, Cambridge, for the Rev. C. W. Townley, together with additions to houses in York-shire and at Maidenhead, and a new church at Rye Park Hoddesdon, Herts.

**Mr. J. Hurry Riches**, president of the Institution of Mechanical Engineers, announced on Tuesday in Aberdeen at the opening of the annual meeting, that Mr. Charles Hawksley, the engineer, had been good enough to communicate to the Council the fact that he desired, in commemoration of the centenary of the birth of his late father, to ask the Council to accept the sum of 1,000*l.* for the foundation of a scholarship or premium.

# The Architect.

## THE WEEK.

It is often surprising that judges do not revolt against hearing building cases, or at the beginning involve the parties to have their differences settled with an architect as arbitrator. Sheriff SHENNAN should be credited not only for the time which he had to spend in attending to the details of a claim for which he awarded 75s., but to prepare a "note" which reads almost like a list of quantities. A Scottish builder offered to erect a house for 760*l.* He received 700*l.* The builder claimed 16s. as balance and extras. The defendants offered 1*l.* in settlement, which was refused; they said the house was not in keeping with the plans and specifications, and the extras were unauthorised. After going through multitudinous details the Sheriff gave judgment in favour of the plaintiff for 9 guineas, but allowed the defendants their costs, which we suppose will exceed that sum. His Lordship in his "note" said that the parties adopted a very expensive method of settling their differences. It would have been much more economical to have remitted the case to a man of skill. Petty as was the case, the Sheriff had to find fault with the conventional language of the specification. "Although," says his Lordship, "it is proved that the frames of the doors are of 'good quality' yellow pine as specified, it was ought to be proved that by custom of trade something was always understood to be allowed off the thickness for finishing. I am not going to give countenance to any such argument. The sooner tradesmen recognise that in dealing with the public they are to use words and measurements in their ordinary meaning, the better for all parties." His Lordship would only allow the expenses of two skilled witnesses while admitting that the others were "most helpful, but in so small a case they were luxuries for which defenders must themselves pay, so far as preliminary investigations are concerned." There is no doubt to the Scottish mind a certain pride in having an action decided by a proper judge rather than by an arbitrator who cannot claim to represent the dignity of the law. But some mercy should be shown to a lawyer in asking him to consider the qualities of chimes-poles, grates, stairs, sills, thicknesses of doors and skirtings—items which are not comprised in the ordinary course of legal education.

THERE can be no question about the importance of lighting schools, although little attention was given to the subject until a recent time. In foreign schools various methods of measuring the quality of light are used. One introduced by Dr. STANISLAW RUZICKA, lecturer in hygiene, Bohemian University in Prague, was described at the International Congress of School Hygiene. This method is as follows:—A rough model of the proposed school is made; this model is placed in a large box, the ceiling of which is constructed to represent the sky; one side represents the front wall of the building opposite the school—the other sides consist of mirrors; the back is removed to allow access. When a measurement is being taken this aperture is covered with a cloth, and the only source of light is the artificial sun. The relative photometer is so constructed that a mirror plane of a Summer-Brodhun cube reflects through small apertures in the roof of the model to the observer's eye the image of any particular spot in the schoolroom, so that it appears as a spot in the centre of a greater and brighter image of a portion of the artificial sky reflected by a mirror behind the Summer-Brodhun cube. A movable wedge of grey glass is then shifted over the image of the ceiling until it is reduced to an identical brightness with the image; a reading can be got giving the relation of any

spot in the model to the ceiling brightness. How far such a method would be useful in an English town on a foggy day has yet to be determined.

ARCHÆOLOGISTS are rivalling the historians and biographers in reviving interest in men who are likely to be ignored owing to the number of celebrities which now enriches the world. HANNIBAL is one of them. FLAUBERT'S romance and REYER'S opera have restored Carthage. But HANNIBAL was so much of a school hero he has suffered neglect. The Germans have not, however, neglected the great enemy of ancient Rome, and investigations have been made into the history of the huge mound at Libyssa, which according to tradition was the burial-place of the mighty warrior who nearly succeeded in breaking up the Roman Empire. Fearing that he might be surrendered to his enemies HANNIBAL in 183 B.C. poisoned himself. At a later time the Roman emperor SEPTIMIUS SEVERUS, regardless of old animosities, erected a magnificent marble monument at the site. But in such a district as Bithynia and so ill-governed a country as Turkey it was not likely that the monument would be preserved. There are, however, some signs of such a work, and the earthen tumulus, which probably formed the core of the Roman monument, still remains. Photographs of the place have been taken by the archæologists, which may at least prevent useless journeys. But the fame of HANNIBAL must still be taken on trust from the historians.

THE factitious condition of the market for Old Masters is suggested by the announcement that Messrs. DUVEEN BROS. have acquired the collection of paintings of the late RODOLPH KANN for a million sterling. It surpasses all precedents, and the victors must be congratulated on their enterprise. But with outlay of that kind proportionate advantages should follow. Messrs. DUVEEN, we hope, will be able to make adequate profit on the transaction. It may, however, be doubted whether the possession of the whole collection could bring much intellectual advantage to a nation, or whether one or a few of the works could elevate an ordinary amateur. To be able to show one of the pictures by REMBRANDT, FRAGONARD or DE HOOCH will be evidence of wealth, like the possession of a folio SHAKESPEARE. But it is possible not one of the rich collectors will derive as much genuine delight from their foreign acquisitions as VERNON and SHEEPSHANKS obtained from the modern English pictures which were partially produced before them. The Dutch merchants who bought REMBRANDT'S and the other artists' works were loyal to their countrymen, and it is time that Englishmen also should have the courage to restrict their purchases to works which they truly appreciate.

DURING late years the "donjon" of Vincennes has been closed to ordinary visitors, although from its architectural and historic interest it was peculiarly attractive. As Vincennes was a royal residence, the keep did not present the appearance of a simple square tower. Each of the five storeys has Gothic windows, and at one time the niches above the entrance were likely to be occupied by statues. Among the prisoners who were retained in it were several of DUMAS'S heroes—HENRI OF NAVARRE, afterwards HENRI IV., the Duc DE BEAUFORT, the Surintendant FOUQUET. In the eighteenth century it might be called the hotel of MIRABEAU, for he was repeatedly confined there; and DIDEROT and other pioneers of the Revolution were acquainted with the interior. The donjon of Vincennes is about to be converted into a historical museum, for there are treasures still existing which are considered to be unsuitable for any of the numerous museums of Paris. The building remains practically as it was in the days of CHARLES V., a king who preferred to live in Vincennes rather than in the Louvre.

## COSMIC ARCHITECTURE.

IT is now impossible to determine whether the description of the *Shield of Hercules* ascribed to HESIOD, or the description of the *Shield of Achilles*, generally accepted as HOMER's, is the older. But the difference in character between the subjects represented by the two is almost enough to indicate at least that they did not come from poets who were contemporaries. It is true the metalworker in both cases was the same, viz. the awkward but artistic VULCAN. And there may be a resemblance between some of the scenes. But on the whole the two might have been produced in different stages of civilisation.

Let us take the *Shield of Hercules* first, because general opinion is in favour of its priority. If we might dare to compare things which are so unlike, we should say that HESIOD's shield is Japanesque in treatment. We see dragons, Titans, snakes, gorgons, centaurs and figures which we cannot explain, but which probably were allegorical. We seem to have got a peep into the laboratory of Time or Destiny and to see society in the making.

The glorious shield made for ACHILLES is indicative of a period when a more ordered state existed. It is not altogether idyllic, for we see the sword is still a factor in human affairs, and peace may at any moment have to give way to war. Nevertheless, the central boss, instead of presenting ferocious dragons, is symbolic of the heavens above. Around the rim we have a river which is more suggestive of control than the turbulent waves. The compartments are all symbolical of organisation rather than of fierce impulses. We have a city at peace, but not free from contests, which were, however, settled by counsel of the oldest. We have also a struggle between the city and its enemies, conducted on the principles by which the world at the time was guided. But poet and sculptor are glad to get back to harvest and vintage scenes, with village dances of youths and maidens. Some archaeologists have supposed that whoever was the describer had seen with his bodily eyes and touched some shield of Babylonian or Ninivite art. If so a new interest is attached to the work, for it is difficult to imagine the great black-bearded warriors we see in the reliefs in Paris and London as condescending to unbend themselves amidst simple enjoyment.

Whatever doubt may surround the works, we must acknowledge that in both an effort was made to describe the poet's theory of life. Each may have been, for all we know, suggestive merely of the feelings of the two writers, and should not be taken as symbolising the general history of any period. One man was evidently pessimistic, the other only partially so. But each endeavoured by his figures and groups to express a meaning of which everyone who read the descriptions, although they could not see the shields, would be able to approve.

May we not also presume that in the Greek temples something was done to bring the buildings into relation with the world around them, and with antiquity if not with futurity? In asking this it must be remembered how imperfect is the evidence. Sculpture in several forms embodied the legends which were much more than historical pictures, for they indicated the beliefs which were accepted by the Greeks, and which served for them as solutions of the mystery of life. But they were not afraid to adorn the roof with golden stars. One kind of ornament evidently recalled the waves of the sea: the fret may have had a connection with the rocky surface of Greece, and the egg and dart was of greater importance than it is in the cornices of modern villas. It should not be forgotten that with the Greeks the world, or as much of the earth's surface as they were acquainted with, was not accepted as delightful or mystic. A Greek would hesitate a long time to suggest a mountain, although his pediments might suggest the Pyramids. He was essentially a townsman—let us say a typical cockney—

only he had neither motor cars, nor bicycles, nor ways to whirl him away into regions given over to slaves and overseers with heavy whips. The haustible supply of ideas for ornamental forms of by nature were unheeded by him. Indeed, it almost be said that he despised such things. He was able to ornament his buildings without much aid from them, for the only form for which he had a weakness was the palmette, which, we suppose, aided in his exalted thoughts. The sculptors could easily have afforded unlimited pleasure to the people of many times if they had utilised the plants and trees which were to be found around Athens. But the olive, although it was indispensable to a Greek's existence, was sternly ignored, although there may be a suggestion of it or part of it in the ovolo.

The architectural cosmos of the Greeks was circumscribed. It would not have been difficult to get so many artists at command to impart a wider relationship to the buildings, and to have made them as expressive as the shields of HERCULES and ACHILLES. The success of the experiment at the Erechtheum is enough to indicate what was possible. But the architects set a restraint upon their invention, and in consequence pure architecture will be a possibility so far as one of their buildings exists for a model or we have descriptions of it.

Inferior as was Roman architecture if considered from a superior standpoint, there is no doubt that the buildings were more widely related than those of the Greeks. There was no idealising with sculpture; it was "up-to-date." Every citizen knew who were represented by the figures which abounded within and without, and by the inscriptions which supplemented them. The inscriptions, indeed, gave a history of a building. The ornament was not the wealth derived from foreign lands was partly dependent on the temples and public buildings, and edifices were so crowded, it must have been difficult to make one's way between them. Just as in the processions men and animals from conquered territories were necessary, it is not unlikely that buildings also symbolised distant countries were to be found at Rome, although they were subsequently sacrificed for the sake of an approach to unity. Certainly there was so much variety and profusion, only an able architect could have brought Roman buildings within the compass of a theory, and it cannot be said that even VITRUVIUS succeeded in doing so.

It is not until we come to Gothic that we find unity—the cosmos—which was imperfectly expressed in ancient Rome. Nevertheless, here we are met with a state of things which must be considered as anomalous. In Rome bishops sought a power that was as wide as the Roman Empire. But as a means to attaining that end architecture was not adequately valued. We read of clerics journeying from all parts of Europe to Rome in order to draw inspiration for their new churches. Yet speaking generally the buildings which were freshest in their minds derived their force from their history and associations. The basilicas were merely makeshifts, and it took many a century before they were supplanted by churches more worthy of the uses to which they were applied. It has been pointed out that at the time of the Reformation a demarcation might be regarded as laid down which has been almost unaltered during three centuries. In the history of architecture a somewhat similar division was accomplished. Italian Gothic was not strong enough to extend itself, notwithstanding all the influence thrown behind it. On the other hand, a wave of style spread around it and spread over several of the most important countries of Europe. During some centuries there was no checking the advance of the force which in a comparatively short time appeared as if it were a thing *sui generis*.

An architectural cosmos of a new sort was established. For the first time the whole earth was

to co-operate. It might be supposed that the men were eager to produce a great work on the subject—so largely were vegetable forms employed as models—and on physiology, for not merely spiritualised forms and women appeared among the sculpture but monstrousities were utilised in the gargoyles and grotesques. Colour was revealed and building materials were shown to have novel properties. Legends were much respected as among the Greeks, and the Gothic architects went further, for they endeavoured to throw the future to men's gaze and to represent scenes of another world as if they were diocesan events. As has been often remarked, a Gothic building is an encyclopædia which does not confine itself to the past or the present, but attempts to unveil the mysterious here-and-there.

Yet, with all this ultra-human expansion, order is everywhere. Gothic buildings can be easily systematised, not merely as masses of stone but as efforts in which the character prevails in mouldings and in ornament. The gentlemen of the eighteenth century used to say that the essential difference between Gothic and Classic was that one was laid out on system, while the Mediævals were ignorant of everything systematic. Never was a conclusion less justified by realities.

Having Gothic and Classic before them, the Italian architects of the Revival were almost bound to adopt the one or the other as models. Greece at the time was unknown, and the buildings became the inspiring power. The systematising also became more easy than if an attempt had been made to surpass Gothic buildings. The dome and the arch acquired new importance, and subsidiary details could be requisitioned as desired. But it must be remembered that Renaissance architecture can never be as restive of a dominant principle as Greek, Roman or Egyptian. It is open to every architect to satisfy his own sense of what is pleasing or defective. He can be equally severe or grotesque according to the desire which dominates him for the time. It is therefore a necessary fact that when a man has exercised restraint within a limited field. But as his success is personal it is unwise for anyone to maintain that what has been done should be imitated by others. Cosmic architecture is no longer that of a nation or a people. It is individual in origin, and therefore limited in its success.

## LEGALISED INJUSTICE AT ACTON.

It cannot be too often repeated for the benefit of architects and builders that contracts with local authorities are not valid unless signed and sealed with the common seal of such authority. This is particularly true when the sum claimed is over 50*l.* A case of the kind may be said to be now before the public, if before the Courts, in respect of the Acton municipal buildings, and which has taken four years to develop. In the early part of 1903 a competition was arranged for municipal buildings. The plans submitted by Mr. HUNT, of Kensington, were adopted. He prepared the working drawings, and tenders were invited in due course; the lowest, amounting to 80,900*l.*, was accepted. The Local Government Board considered the sum too large to be expended at the time. Mr. HUNT then paid 3,000*l.* upon the lowest tender, and the contract was ended.

Having gained acquaintance with all the circumstances and as the need for municipal buildings became apparent, the architect was instructed to present a scheme for a building which would cost 35,000*l.* The plans having been approved, Mr. HUNT received instructions to prepare the working drawings, which were formally approved and adopted. A contract deed was drawn out by the clerk, and it was intended to have it sealed at the next meeting. The meeting of office of the members was expiring, and the day, unluckily for Mr. HUNT, fell upon a Sunday. The meeting was summoned for the day following,

but when the chairman sat down an injunction was handed to him from the High Court prohibiting the meeting, on the ground that as the term of office had expired there was no power to assemble unless there was a new election.

Everyone knows that in our day there is a stereotyped cry for economy regardless of all other considerations. And the good people of Acton were no more able to resist the temptation to join in it than the electors in most parts of England. It serves for a time at least. Nevertheless, as a rule, one local authority generally imposes as heavy rates as its predecessor. It was not difficult to make out that municipal buildings which would cost 35,000*l.* formed a flagrant example of a disregard of the poverty in Acton. It was therefore announced that the new Council were about to solve the problem by erecting a town hall which would only cost about one-half the sum contemplated, or 18,000*l.*

No one can dispute the right of the elected representatives to be as careful as possible in all matters of outlay. If they were satisfied with the unsuitable premises which are now used, or if they proposed to meet during several years in temporary offices of corrugated iron, we suppose the ratepayers, or at any rate the majority of them, would be indifferent. However, they should at least compensate the architect for preparing plans for a 35,000*l.* building, but he has been arbitrarily set aside under the protection of the law. According to the ordinary equity which is adopted by private persons in dealing with architects for schemes which are not carried out, Mr. HUNT is entitled to 2½ per cent. on 35,000*l.*, or 875*l.* But having the law on their side, the District Council refuse to pay one penny. Mr. ALEXANDER GLEN, K.C., has been asked to give his opinion. He points out that the amount exceeds 50*l.*, and that there is no contract under seal. Therefore he considers that the Council could successfully defend any action based upon contract which Mr. HUNT might bring against them in respect of that item, on the grounds that there was no such contract under seal. Mr. GLEN believes there was nothing to prevent the Council from dropping the whole or any portion of the original scheme, or from adopting a different scheme and from employing another architect for the purpose of carrying out such different scheme, without paying any compensation to Mr. HUNT for the loss of remuneration for work which he would or might otherwise have performed. On the question whether the sealed conditions of competition in conjunction with the several resolutions of the Council constitute an appointment or contract under seal with Mr. HUNT to carry out the buildings (not any particular design), counsel says:—"The sealed conditions of competition communicated to Mr. HUNT, who performed work for the Council on the faith of the sealed document, no doubt created a valid contract under seal between the parties; but its terms could not, in my opinion, be subsequently altered by unsealed resolutions of the Council so as to give Mr. HUNT any further or different rights against the Council under that contract. These conditions related to only the original designs and the carrying out of those designs, and did not in my opinion amount to a contract to remunerate Mr. HUNT for making or carrying out a different scheme without any further contract."

On one point only counsel appeared to recognise a claim, and that was as to whether the architect could be regarded as an officer of the Council, in which event it would be a duty to assign him some reasonable salary or allowance for the work done. Mr. GLEN said:—"I see nothing, however, to prevent Mr. HUNT from obtaining judgment on a *quantum meruit* for the several items of work which he actually performed without any contract under seal at the request of the Council, after he had completed the work which was the subject of the sealed documents, except so far as any par-

ticular request may necessarily have involved work for which the reasonable remuneration would have exceeded 50*l*."

We cannot believe that a body of respectable Englishmen would wilfully withhold his earnings from anyone who had the clearest moral right to them. It is true the chairman of the Council considers the rights as being only sentimental. But men in office must be excused if they misapply language occasionally. What is probably the principal obstacle to the payment of Mr. HUNT's fees is the fear that the official auditor will not recognise the claim, and it would fall, in theory at least, upon the Council. To say that Mr. HUNT has already received a large sum of money from which Acton derived no advantage is only a distortion of facts. If the former Council asked for designs for a town hall which was to cost 80,000*l*. instead of 35,000*l*. or 18,000*l*., the people of Acton must accept the consequences of the decision of their elected representatives. If it were required, the then Council would no doubt be able to put forward a justification of their conduct. Mr. HUNT did not draw up the conditions of the competition, and he cannot be made responsible for them. If the spirit of fair play were recognised he would have been asked to prepare sketch plans for a building to cost 18,000*l*., just as he had been asked to prepare plans for one to cost 35,000*l*. Youthful competitors may say that he has no claim. But several precedents could be brought forward to suggest that even an architect can have a sort of vested interest in a scheme, and it is for the general interests of the profession that it should be accepted. Indeed, it may be said that if architecture were properly organised as a profession no architect who respected himself or his fellows would enter on the new competition. It may also be observed that there are some doubts whether such a building as is desired can be carried out for the sum proposed. According to the surveyor's calculations, at 11*d*. per cubic foot the cost would be 23,320*l*., or say 23,400*l*., and at 1*s*. a cubic foot the cost would be 25,440*l*., or say 25,500*l*., and he thinks that the building could be erected in a substantial but plain manner for 11*d*. per foot.

We need not, however, speculate about what the future will bring forth. We are dealing solely with a past transaction. An architect has carried out faithfully the instructions he received, and because a meeting was held on a Monday instead of on a Saturday, he is to receive no payment for his labours. The law, however, is on the side of those who would punish the architect, not for any demerits of his own, but in order to bring odium on those who gave him directions. Need we wonder if sometimes in the American courts, where respect for English decisions is occasionally pushed to excess, the desire for honesty and fair play rises in rebellion against a system which seems to have been formulated in a Government Office, and which is unjust if not iniquitous?

---

**The Dean and Chapter of St. Paul's** have accepted the design of Mr. Reginald Blomfield, M.A., A.R.A., for the new St. Paul's Cross, which is to be erected as the result of a legacy of 5,000*l*. left for that purpose by the late Mr. H. C. Richards, K.C., M.P. It will consist of a bronze figure of St. Paul, 9 feet high, placed on a column which rises from a lofty and elaborate pedestal, with figures at the angles supporting coats of arms on cartouches at the four sides. The pedestal is on a stone platform raised some 4 feet above the ground line, and surrounded by a parapet which stands on three broad circular steps above the present pavement level. The enclosure which surrounds the pedestal is reached by a flight of steps with bronze gates. The site is where the old St. Paul's Cross stood, and, like its predecessor, this also will be available for open-air preaching. The materials to be employed are the best Portland stone, Belgian black marble and bronze.

## WOODHAM FERRIS AND BICKNACR PRIORITY.\*

WODEHAM, Udeham, or Odeham, as the name is variously spelt in the old records, indicates an estate in a wood. Woodham Ferris is one of the double place-names rather common in Essex, where the first word applies to the district generally and the second distinguishes the particular manor or parish. Here there are Woodham Ferris, Woodham Walter and Woodham Mortimer. Of like character there are the three Tolleshunts, the three Layers, Theydons, two Willingales and nine Rodings or Rootings. In Domesday Book this parish is described as *Ude de Ferraris*, in the Hundred of Celmersfort, held by *Ude de Ferraris* or *Ferrers*, who held it from Bundi, the predecessor, as one manor and xiv hides. The wood afforded food and shelter for no less than 800 swine. "DCCC porcis."

In the thirteenth century Robert, Earl Ferrers, the lord. He was married to Sibilla, daughter of Roger de Braose, by whom he had two daughters, Melicent, of Roger, Lord Mortimer, and Agatha, concubine to John, by whom she was mother to Joane, who married Llewellyn, Prince of Wales.

The mansion or manor-house of the Ferrers family, situated about one mile north of the church, and the site of it is now occupied by a moated farmhouse.

Stow, in his *Survey of London*, has a good deal to say about one Robert Fitzwalter, chastelain of London, and his duties and privileges in that capacity he describes at length. Fitzwalter was also lord of Wodeham and of Baynard's Castle. Stow continues:—"King John unlawfully loved Matilda Fair, daughter of this Robt. Fitzwalter, but could not marry her nor her father would consent thereunto, wherefore and for like causes ensued war throughout the reign. This Robert afterwards took as his second wife Eleanor, daughter and heir to the Earl of Ferrers, in 1289. Whether she was a daughter of Robert, Earl Ferrers, above mentioned, or of a later earl, is not clear.

These historical fragments, however, show the connection between the three Woodhams and the reason for their distinctive names. Thus Roger Mortimer, son-in-law to Earl Ferrers, was lord of Woodham Mortimer, and Robert Fitzwalter, also son-in-law to a later Earl Ferrers, was lord of Woodham Walter.

There are now no monuments of the Ferrers family seen in Woodham Ferris Church, although this is recorded to have been built by Robert Earl Ferrers in the reign of Henry II. (1154-89). It is dedicated to St. Mary, and consists of a nave with aisles, chancel and west turret and one bell. There are six clerestory windows and the south aisle has three bays, an Early English door and four clerestory windows without tracery. In the north aisle there are three bays, two windows of late Decorated date, a blocked-up doorway about the same period. The piers are alternately octagonal and round. The chancel arch is of Early English and over it is a fresco, recently discovered, which represents the Resurrection. There was a fourteenth-century rood-screen of the Decorated order, four panels which, displaying elegant tracery, are preserved in the rectory. The chancel windows are of Decorated Perpendicular architecture; there is a piscina and creche of early work and three plain sedilia under a three-centred window. The font is octagonal, of the Early English period. The nave has a fine oak roof which has recently been uncovered, and there are some ancient oak benches carved poppy-head finials. The registers date from the thirteenth century and are in good condition. The following are a few of the entries:—

Joan Kinwelmarsh was baptized by the mydwyfe at 25 Dec. 1572.

Repentance Kynge daughter to John Kynge and base born was baptized x day of October 1602.

March 6th, 1613. Marye the daughter of Dorothee or Katherde, late of Coxall as she affirmeth brought in bed in Woodham f. the father unknown bapt'd. Mar. 6th.

Jan. 22, 1796. Thos. Cooch was half baptized received into the Church June 13th.

There are several entries about this period of children being half baptized, and it is thought this indicates that they were baptized by laymen at home, and afterwards received into the Church.

---

\* Read at a meeting of the Upper Norwood Athenæum, June 22, by Mr. Jonathan Downes.

There are a few miscellaneous notes at the commencement of the register, one of which is as follows:—

Inscription formerly on a stone in Tower outside W. door.

Mense Augusti Anno Dom<sup>i</sup>. Millesimo quadringentesimo sexagesimo (August 1460) Anno vicesimo octavo Henrici sexti fuit hoc opus inceptum.

In the north wall of the chancel is a good marble monument of Jacobean style, bearing a coloured effigy of a lady wearing a large ruff and hood kneeling at a table. This is the inscription:—

Cecilie Sandys Daughter  
of Thomas Wellford of Crannbrook in  
Kent, Esq. Sister to the worthie souldiers  
Sir Jas Wellford and Sir Thomas Wellford, was  
Wife to Edwin Sandys Archbishop of York who  
Died in great honour in 1588 when he had  
Lived full 70 years. She lived a pure mind 22 yrs  
To hir last. She bare him 7 sons and 2 daughters she lead  
A most Christian & Holy life carefully educated hir  
Children wisely governed hir Family charitably relieved  
The Poor and was a true Mirror of a Christian Matron  
She departed this life constant in the Christian Faith  
5th Feb. 1610. At the rising of the Sun hir blessed Soule.  
Ascending to the consort of the Blessed and hir  
Bodie lyeth here interred expecting  
The Joyfull Resurrection.

On the ground underneath the monument is a marble stone bearing her name, date of death, &c., and ending, "And is under this stone buried." The husband of this lady, Dr. Edwin Sandys, was a notable dignitary of the Church in Tudor times. He was born at Hawkshead, in Furness Fell, Lancashire, about 1518, educated at Furness Abbey, graduated at St. John's, Cambridge, as B.A. in 1539 and M.A. in 1541. He was Vice-Chancellor of his University at the time of Queen Mary's accession, and, as he had strongly supported on religious grounds the claim of Lady Jane Grey to the Crown, and although proclaiming Mary as queen at the order of Northumberland had predicted that punishment would overtake the latter, it is little wonder that in July 1553 he was sent to the Tower. He was liberated through the mediation of Sir Thos. Holcroft after nine weeks' imprisonment. He then went to the Continent, and there made acquaintance with Peter Martyr, at whose house in Zurich he was staying when he heard of the death of Mary and returned to England.

He preached before Queen Elizabeth at York a sermon which delighted her, and preferment soon followed. He was appointed Bishop of Worcester and consecrated at Lambeth Palace on December 21, 1559, was made Bishop of London in 1570 and in 1575 was translated to the Archbishopric of York.

He died at Southwell on July 10, 1588, and was buried in the Minster. Strype describes him as an obstinate and conscientious Puritan. He objected to the sign of the Cross in Holy Baptism and to the use of vestments, but on these points he had to yield.

He is connected with Woodham Ferris by the fact that about 1560 he built a mansion, which is still named Edwin's Hall. This, by the kind permission of the present owner, Mr. G. W. Hinton, we have visited to-day. It occupies an elevated position three-quarters of a mile west of the church, commanding extensive views over the valley of the Crouch and surrounded by a double moat, the inner one still complete and the outer distinctly marked, though now dry in places. It is built in the Tudor style, with stone mullions to the bay and oriel windows, and has some fine old wainscoting which is especially worth notice, as it shows the introduction of the mitred joint. In the older work the upright moulded frames and plain transverse frames of the panels meet at right-angles, and the latter are ornamented only by a chamfer beginning and ending inside the angles. In the later work both frames are moulded and meet at the angles in a mitred joint.

We have also seen to-day, in the parish of Woodham Ferris, the remains of Bicknacre, or Bikenacar Priory, which are of considerable interest from an antiquarian point of view. It was founded on the site of a hermitage occupied by one Jordan previously to 1157.

(The name of Jordan is somewhat unusual, but it may be noted that there is record of one Jordan de Shepey buried in the abbey church of Minster Sheppy in the fifteenth century.)

About 1175 this hermitage was converted into a Priory of Black Canons by Maurice FitzGeoffrey of Tiltar (Tilty), dedicated to the Virgin Mary and St. John Baptist. The chronicles say it was built and endowed by Maurice Fitz-

Geoffrey, sheriff of Essex, at the charge for the most part of Henry II.

King Edward I. in the thirteenth year of his reign gave leave to the Prior of Bicknacre to empark waste land of 60 acres. Of the priors of Bicknacre it is recorded:—The first prior, Ralph, died in March 1237. His successors were

WOODHAM FERRIS CHURCH.

Andrew, John de St. Edmund, Ralph de Dunham, William de Wilburgehan (time of Edward I., 1272-1307), Alan de Barcking, Benedict de Roff, Robert de Blakenham, Robert de Ramesdene (Edward II., 1307-27), Matthew de Grafton, Reginald de Theydon, Ralph de Chishull (Edward III., 1327-77), William de Thurle, John de Thacstede (1385), John Gosfeld (1396), William Winchester, John Horewood (Henry V., 1413-32), John Ocle, John Colman, John Cradock, William Chevington (1479), Richard Palyrton (1490), Wm. Bowland (1499), Thos. Wellys (1504), Edward Goding (1505).

RUINS OF BICKNACRE PRIORY.

About 1507, through the carelessness of the governors and other accidents, the priory had become so poor that at the death of Edward Goding one mark only was left in the treasury of the house and one canon only remained on the establishment.

The rest of the story is told by Stow in his description of Bishopsgate Ward:—

Then have you the late dissolved priory and hospital, commonly called St. Mary Spital, founded by Walter Brune and Rosia, his wife, for canons regular. Walter, Archdeacon of London, laid the first stone in the year 1197.

The prior of this St. Mary Spital, for the emortising [redemption] and appropriation of Bikenacar, in Essex, to his said house of St. Mary Spital, gave to Hen. VII. 400*l.* in the 22nd of his reign [1507].

St. Mary Spital gives its name to Spital Square and Spitalfields.

The sole remaining fragment of what must once have been the noble priory of Bicknacre is a tall Transitional arch, apparently the chancel arch of a church of imposing

dimensions. It seems to have been preserved when the other remains were destroyed in 1816 from sordid rather than reverent motives, as it is said that the Priory Farm and four adjoining farms are exempt from payment of tithe so long as any portion of the original priory remains above ground.

### NEW CATHEDRAL, WASHINGTON.

THE following description of their design has been contributed by the architects, Mr. G. F. Bodley, R.A., and Mr. Henry Vaughan to the *Inland Architect* :—

In style it is, as was wisely desired, Gothic of the fourteenth century—a style of architecture, as we think, the most beautiful that the world has ever seen. In its dimensions it will be larger than most of the cathedrals in England or on the Continent. The total length is 476 feet and the total width 132 feet. These are the external dimensions. The height to the ridge line of the roof is 130 feet, while to the internal apex of the vaulting it is 93 feet.

The central tower will rise 220 feet from the ground. The plan is that of nave and aisles, transepts, choir and two chapels. Double aisles are planned for the nave. These latter will be especially useful for monuments and memorial windows and tablets. The choir terminates in an apsidal sanctuary. The building will be vaulted in stone throughout.

The lighting of the interior is by ample clerestory windows. The light, thus coming from so high a level, will in your bright climate be striking and uplifting. There are lower windows in the aisles, but they are quite subordinate. Then there will be a striking effect of light in the "sanctuary" or eastern part of the choir. For there is to be a large window both on the north and south sides, coming lower down, but much out of sight, being in the depth of thick walls. These windows will be 65 feet long. Light will be given by them to the apse in an especial and striking manner. It is for this important effect of light that we propose to have no chapel at the far eastern end, in the most usual position when a choir-aisle runs round the east end.

This plan has the advantage, too, of giving an interior of which the whole length is seen on entering at the west end, thus adding to the perspective and to the impressive effect of the building.

We propose two chapels at the ends of the choir aisles. An aisle terminating in a mere wall always has a poor and an unsatisfactory effect. It will be a great advantage to have chapels here at the eastern ends of the two aisles, with their screens and altar and their reredos. The eye will be attracted down the "long-drawn aisles" to these chapels. The apse, with the effect of light there that we have spoken of, should be the leading and the impressive feature. The exterior of the apse, unhidden by a further building, will be commanding in its lofty proportions, and will make a very conspicuous landmark eastward, crowning the hill with its cluster of many pinnacles.

The stained-glass clerestory windows, as they could be placed, should consist of single figures, for they are too high up to contain "subjects." The glass should have finely-coloured figures on a light, silvery ground. But there are other things for which gifts would be more desirable, before the glass, in point of time. There are many stone statues desirable and many carved subjects.

We have alluded to the outer aisles as being available for monuments. Here there could be placed mural tablets as memorials, and brasses round the walls; and, indeed, "altar-tombs" with effigies, one in each space, could be placed as opportunity occurs.

Approaching the west end of a triple avenue of trees, those visiting the cathedral will find three lofty open arches, the central one wider and much higher than the other two. These lead to three wide vaulted spaces to be used as large porches or porticos, and so on to the three recessed west doorways. The central portico could be treated richly internally with arcading and many statues and carved subjects. While the exterior surroundings of this lower part of the west end are massive (the richer part being kept for the top of the towers, "whose glory is in their height"), the interior of this central portico can be rich and stately and be made beautiful with its many figures and pictorially carved subjects. In passing, may we say that all and every gift should not be in kind, but that the money should be given for each gift, and that all things given should be approved by the architects. Incon-

gruous things may be given, with the best intentions, that may be out of character and without harmony with the surroundings. This is most important. It is astonishing what harm a single note out of harmony will do; and so with every detail of furniture or colour, everything must be in keeping and manifest the same intention, drawn from the same inspiration.

Passing along the north side of the cathedral externally, we would speak of the height of the walls, the interest of the window tracery in the clerestory, the massive, but not too heavy, flying buttresses and pinnacles; of the light and shade given by them, and the bands of rich work in the outer aisles, of the moulded plinths and windows and niches and the carved canticles of the Church's matins and evensong, and the traceried parapets. Then, passing these, we get to the north transept, with its protected entrance up many steps, and its high turrets and rose window. Then to the vestries for bishop, clergy and choir, and so to the lofty east end, with its apsidal termination and its bold flying buttresses and pinnacles. "Sanctus" will be carved on each of the three sides of the apse parapet.

Coming round to the south side we see the outside of the lady chapel, and a somewhat similar to the northern, but varied, south transept, with its different rose window, doorway, with figures set round it, and its many steps necessitated by the fall of the ground. Then to the baptistery, a lofty stone octagonal erection, with its seven windows and high roof, surmounted by a metal cross. The effect of this baptistery externally will be good. It will be varied in its light and shade, being octagonal, and it will stand out from the great mass of the church, with its gilded cross at the apex, catching the light, and its many flying buttresses and its connecting passage.

Such will be the leading features of the exterior, all of commanding proportions.

And now to enter the cathedral at the west, through the great portico we have spoken of, and through the shelter of an internal oak lobby.

The first impression will be the continuous height of the main or central part, namely, the nave, choir and apse. The next, and nearly as powerful a one, will be width; for with the outer aisles and the double range of columns on either side and the transepts, the effect of the width will be very considerable. Then, as we hope and think may be confidently anticipated, will be the uplifting proportion of the whole—the tall piers and arches, with the triforium and the lofty clerestory, and the rich and full, tree-like, branching vaulting, springing from soaring vertical shafts rising from the floor, and of slender diameter. For pains have been taken to make the interior effect a striking and an inspiring one. Then the eye will be taken up to the rood and to the broad enriched soffit of the easternmost arch of the tower, with its carved angels, and to the rood which it frames; to the screen with its delicate open work, only veiling the beyond with a very transparent veil, to the dark oak or other wood of the choir stalls with their fretted canopies; and so to the bright sanctuary with perhaps rays of light from a southern-like sun, lighting but half veiling with light the reredos, with its sculptured saints and the Christ in glory, blessing, above all.

The triforium will be continued round the apse, knitting all together into, as we hope and believe it will be, an elevating, harmonious whole—*ad majorem gloriam Dei*.

One word as to the treatment of the building as regards its richness or the reverse. We think the drawings show that it is amply rich enough. That there should be plenty of surface of massive stone ashlar is most desirable for all good architecture, especially with a building so large as this. A small building may be rich all over, but it is beneath the dignity of a great one. For a large building, if well designed, has an instinctive dignity and a grandeur about it that may well dispense with too lavish exuberance of ornament. Again, there should be concentration of richness and not a spreading of it all over a building.

On the central tower we propose to have a band of large angels, each holding a scroll with a word of the "Gloria in excelsis Deo," &c. They will give a rich effect and teach a constant song of praise. This band of angels will be an original treatment not before attempted, certainly not on this scale. The figures would be about 10 feet high.

There remains the question of the stone to be used, and it is a very important one, for stone ashlar would be used both inside and outside the building. Knowing as we do the good effect of churches built entirely of a good light red stone, and the cold look that white stone has, we cannot

but recommend the use of a good red one. It should be by no means brown, but of a good, soft-looking, rosy tint. The red stone we should use would not be too dark or at all heavy looking. With red stone a church has a warmth of colour and a look of the absence of newness that is very satisfactory. Details for red stone are best bolder, and therefore less expensive, than those suitable for a white stone.

The pavement of the interior should be of American marbles—simpler in the nave and aisles, richer in the choir, and especially rich in the sanctuary.

## TERMINOLOGY OF DECORATIVE ART.\*

DECORATIVE art, as the subject of anthropological study, needs analysis on the technological side in order to describe and define the precise contribution made by the artist's hand to the decoration of the object. So long as the decorative motives are recognisable attempts to represent some actual object, such as an animal or a plant, or part of one, description in general terms is easy, and for all beyond this graphic illustration is inevitable. But in the more abstract, and particularly for "geometrical" types of decoration, the actual processes employed by the artist stand in a more important relation to the completed work. Artistically the effects produced by drawing on the same surface (a) a double series of alternate triangles, and (b) the limiting lines of a band of continuous chevrons are

practically indistinguishable, but technologically their origin, affinities and potential development are quite different. For example, simple enhancement of the construction lines leads in the case of (a) to patterns like (c) and (d); in the case of (b) to patterns like (e) and (f).

In such cases the mere graphic reproduction of the ornament is not an adequate description, still less a definition of it. On the other hand, a sufficiently precise terminology would enable a student at a distance to reconstruct from dictation a pattern which was similar technologically, and actually more valuable for purposes of comparison than a photograph of the original design.

Similar needs have led in other sciences and arts to the adoption of a simple conventional terminology. A botanist, for example, can convey in speech a very precise conception of the morphology of a compound leaf, and of its junction with the main stem; and heraldry has developed a terminology of the distribution of lines, subdivisions and patterns on the surface of a shield or panel which enables heralds to communicate at a distance almost without the use of diagrams. In pure technology the language of sewing and knitting is perhaps the most lucid and idiomatic instance.

The basis of any such system, applicable to the description of abstract designs, must be strictly technological; that is, it must be essentially a description (1) of what the artist did; (2) as far as possible, of the order in which he did it, distinguishing motif from enhancement or filling; (3) if necessary, of the effect produced by the completed work, in cases where this differs from that of the artist's work while in progress. *E.g.* in figure (a) we have the motif of "alternate series of recurrent triangles," leading to a "chevron" effect; in (c) these triangles are enhanced by "hachure" or "hatching" (a term borrowed from the engraver's art), and in (d) by "cross-hatching." In (b), on the other hand, motif and effect are alike "chevron."

In composite patterns the minor elements must be located by reference to the major element which they enhance, or on which they are based, and subsequent phrases must

define their relations to each other; *e.g.* the motive (a) would be described as "between parallel lines, a convergent series of recurrent alternate triangles"; but in (g) the "recurrent triangles" would be not "alternate" but "opposite," and the "effect" is that of a string of lozenges; and in (h)

the triangles would be not "recurrent" but "intermittent" or "sparse"; while the "effect" is that of a hexagon pattern. Similarly in figures (c), (g) and (h) the triangles would be "hachured" or "hatched" from the left, (*i.e.* when viewed with their base downwards and their apex upwards), for the reason that the "generating line" of the "hachures" is the left-hand side of the triangle, to which they are parallels. In figure (e) the chevrons are "enhanced" by "external repetition" of their generating lines; in figure (f) the enhancement is "internal." It might eventually be possible to subsume the special term "hachure" under the general term "enhancement," and to describe the triangles of (c), (g) and (h) as "enhanced internally from the left."

The elaboration of such a terminology as is here proposed should, of course, be gradual; it should be based upon careful comparison of terminologies actually employed in the past by expert technologists; and it should conform in its syntax to the approved usages of heraldry, systematic botany, and the like, which fortunately agree in essentials. It should take account, from the first, of foreign synonyms, and proceed—like other artificial terminologies—partly by the incorporation of brief graphic idioms from the vocabulary of the industries concerned, partly by judicious coinage of words, as in zoology, from Greek or other universal vocabularies.

Much may be done in the meantime to fix current idiom by detailed descriptive analysis of some of the commoner geometrical forms, such as the triangle (which has formed the basis of illustration here), the wavy line, the spiral, or the plait. A conspicuous instance of the confusion produced by neglect of "terminological exactitude" is the greater part of the recent literature of basketry; and this is the less excusable, because in the allied art of weaving an ancient, idiomatic and peculiarly accurate vocabulary exists in nearly every European language.

## BRITISH SCHOOL AT ROME.

THE forthcoming volume of the "Papers of the British School at Rome" will include a paper by Mr. S. J. A. Churchill, H.B.M.'s Consul at Palermo, on "The Goldsmiths of Rome under the Papal Authority: their Statutes hitherto discovered and a Bibliography"; another by Mr. A. J. B. Wace on "Roman Historical Reliefs"; another by Mr. A. H. S. Yeames on "An Ivory Statuette in the British Museum"; another on "The Prehistoric Civilisation of Southern Italy," by Mr. T. E. Peet; and the first portion of a paper on "The Via Latina," by the director (Dr. T. Ashby). This last forms the first part of the third section of the "Classical Topography of the Roman Campagna," which is in course of publication in the "Papers" of the School. The Via Latina is one of the earliest (perhaps the very earliest) of the ancient roads radiating from Rome; and though the determination of the course taken by it presents no difficulty, the remains which have been discovered, and which still exist along its course, are of very great interest and importance.

The School has also been actively engaged in the preparation of the first part of the Catalogue of Sculpture of the Municipal Museums of Rome; in this the assistant-director, Mr. A. M. Daniel, and Mrs. Daniel have been especially occupied. The work is under the general editorship of Mr. Stuart Jones, ex-director of the School; and it is hoped that the first part, dealing with the Capitoline Museum, may be sent to press fairly early in the course of 1908.

The Manchester Parks and Cemeteries Committee have under consideration the subject of the kind of monument to be placed on the site of the now demolished St. Peter's Church. The matter was adjourned for further consultation with the Church authorities.

\* A paper by J. L. Myres, M.A., read before the British Association.

## NOTES AND COMMENTS.

THE difficulty of dealing with the contents of Egyptian tombs has just been exemplified at Luxor. Some months ago it was declared that a royal tomb had been opened, which from the evidence found in it was concluded to be the burial-place of Queen Ti, the wife of AMENHOPTON III., and the mother of AMENHOPTON or AMENOPHIS IV. The latter was a religious as well as a political reformer, for he not only introduced sun-worship but he abandoned Thebes as a capital. He also changed his own name. In consequence of his heresies the orthodox Egyptians rebelled against him, and it was supposed they violated the royal tomb and removed the inscriptions relating to the history of the monarch and his reforms. It was supposed they were indifferent to the remains of the queen mother. But a curious inquirer has removed the bandages of the supposed Ti; and Dr. ELLIOT SMITH, professor of anatomy in the medical school of Cairo, has examined the remains. To his surprise he found that the skeleton was that of a young man of twenty-five or twenty-six. Some may suppose the mummy is that of AMENHOPTON IV., but the bones do not support such a conclusion.

FOR more than a century the University town of Jena has been closely associated with the history of German literature. Several of the best writers were either professors or students, and the numerous commemorative tablets which are to be seen in the streets nearly compensate for the defects of the buildings. The town is well situated at the junction of two rivers. Jena possesses one remarkable old bridge which is believed to date from the fifteenth century, if not from an earlier time. Jena was often invaded, and the Comsdorfer Brücke has sustained the weight of strange enemies, and was the scene of some remarkable incidents. During several years also a man used to stand on the bridge begging for alms which were to be devoted to its upkeep, and which was evidently a survival of the Mediæval practice when a bridge was considered to be a work of charity. Like most other places in Germany, Jena has succumbed to the desire for expansion and the necessity for facilitating traffic. The ancient bridge has become an anomaly. Plans have been prepared for a new structure to supersede it, and, after enduring since 1416, there is little doubt that much force will have to be expended in removing piers which have so long resisted the influence of time.

THERE was some surprise expressed in Dublin when it was announced that the commission for the statue of *Parnell* was to be given to Mr. AUGUSTINE SAINT-GAUDENS, who was generally considered to be an American; and it was supposed that as the money was mainly subscribed in America the statue had also to be produced there. Mr. SAINT-GAUDENS was born in Dublin, but he was taken to America when a baby, and his father was a Frenchman. The sculptor died on Saturday last at his house in Cornish, New Hampshire. America accepted him as a native-born citizen, and, according to the President, there was no greater artistic genius living in the States or elsewhere. At first he practised in cutting cameos, but feeling his power to deal with larger works, he went to Paris and to Rome in order to study art. He was only twenty-two when he produced his statue *Hiawatha*, the merits of which were at once realised. He obtained a commission for a statue of *Admiral Farragut* for New York, one of *Lincoln* for the park at Chicago, and one of *General Sherman*, which is most admired by Americans, for Central Park, New York. His bronze memorial tablet of R. L. STEVENSON, which is now in St. Giles's, Edinburgh, was exhibited in London. His position in America justified his selection to design the principal

coins. He was born in 1848, and therefore had not attained his sixtieth year, and it might be expected that many other important works would be executed by him.

THE collapse of the Pont de Cé on the railway line near Angers must excite alarm not only in France, but in other countries. The bridge, although dating only from 1876, was of a simplicity which characterised the structures of an earlier time. It resembled one of the bridges which ROBERT STEPHENSON denounced, for the main girders were of a double lattice with slight flanges. There was no trussing to impart stiffness and to sustain any extraordinary strain. Looking at the diagrams it does not appear as if the girders were continuous. The cross-girders were likewise of a simple kind, and too much reliance must have been placed on the strengths of the flooring plates, which in reality were without structural value. Although the weight of locomotives and trains has been increased in the course of thirty years, no extra provision appears to have been introduced to sustain the additional weight. French engineers are strong in mathematics. But with the fate of the Tay Bridge in his memory an English engineer hesitates before trusting to formulae unless he also leaves a very large margin for contingencies. If the locomotive acted as anticipated, and went smoothly along the rails across the bridge, things would have remained as before. But by slipping destruction was inevitable. It is true that the rules and regulations of the Public Works Department—and the bridge was on a State line—exact that an annual visit and an examination of the girders shall be made once in five years. But that does not insure that the bridge are equal to the increased strains to which they are now subjected. There is too much reliance on authority in France, and it is easy for people to assume that official inspectors take into account all that is possible to weaken a bridge. As the destruction of the bridge over the Loire demonstrates, perfunctory visitations only give a false security.

IT is satisfactory to learn that the reasonableness of the proposals of the Association of Municipal Corporations respecting the treatment of suburbs was admitted by the Prime Minister when a deputation met him on Wednesday. It is the usual practice on such occasion to maintain that the Government had foreseen the difficulty, and it was announced that the President of the Local Government Board had a Bill on the stock which would deal with the grievance. According to Mr. BURNS there is not one but two Bills drafted; one relating to housing, the other to town planning, and which he claimed would meet the difficulties in a more practical form. It was said by Mr. BURNS that the authorities of towns might have avoided many of the defects if they had consulted his Board. But a long experience has taught the members that applications for advice receive scant sympathy from all Whitehall officials. How much is prejudice need not be discussed. It should also be remembered that legal difficulties are not to be overcome by a circular from the Local Government Board, and to interfere with the arrangement of a man's property is a serious offence. What is needed is an Act which will bring outlying districts under more control than is possible with by-laws alone.

## EDUCATION AND TRAINING OF ENGINEERS.\*

INTERPLAY of action and reaction make for progress not only in the evolution of the scientific industries, but also in the development of the individual engineer. In him, if his training is on right lines, pure theory becomes an aid to sound practice; and practical applications are continually calling him to resort to those abstractions of thought, the underlying principles, which when known and formulated are called theories. Recent years have brought about a so much better understanding of education in its bearing upon the professions and constructive industries that we now seldom hear the practical man denouncing theory or the theorist pooh-poohing practice. It is recognised that each is useful, and that the best uses of both are in conjunction, not in isolation. As a result of this better understanding, distinct progress is being made in the training of engineers. Of this the growth of the engineering departments of the universities and of the technical colleges and schools affords striking evidence. The technical schools, moreover, are recognising that their students must have a sound preliminary education and are advancing in the requirements they expect of candidates for admission. They are also finding out how their work may best supplement the practical training in the shops, and are improving their curricula accordingly. In the engineering industry, too, Great Britain is slowly following the lead taken in America, Germany and Switzerland in the recognition afforded to the value of a systematic college training for the young engineer, though there is much apathy and even distrust shown in certain quarters. Yet there is no doubt that the stress of competition, particularly of competition against the industry and the enterprise of the trained men of other nations, is gradually forcing to the front the sentiment in favour of a rational and scientific training for the manufacturer and for the engineer. As William Watson, in his "Ode on the Coronation," wrote in a yet wider sense of England:—

For now the day is unto them that know,  
And not henceforth she stumbles on the prize;  
And yonder march the nations full of eyes.  
Already is doom a-spinning. . . .

Truly the day is "unto them that know." Knowledge, perfected by study and training, must be infused into the experience gained by practice; else we compete at very unequal odds with the systematically trained workers of other nations. Nor must we make the mistake here in the organisation of our technical institutions of divorcing the theory from its useful applications. In no department is this more vital than in the teaching of mathematics to engineering students. For while no sane person would deny that the study of mathematics for the sole sake of mathematics, even though it leads to nothing but abstract mathematics, is a high and ennobling pursuit, yet that is not the object of mathematical studies in an engineering school. The young engineer must learn mathematics not as an end in itself, but as a tool that is to be useful to him. And if it is afterwards to be of use to him, he must learn it by using it. Hence the teacher of mathematics in an engineering school ought himself to be an engineer. However clever he be as a mathematical person, his teaching is unreal if he is not incessantly showing his learners how to apply it to the problems that arise in practice; and this he is incapable of doing if these problems do not lie within his own range of experience and knowledge. Were he a heaven-born senior wrangler, he is the wrong man to teach mathematics if he either despises or is ignorant of the ways in which mathematics enter into engineering. The fact is that for the great majority of engineering students the mental training they most need is that which will enable them to think in physics, in mechanics, in geometric space, not in abstract symbols. The abstract symbols, and the processes of dealing with their relations and combinations, are truly necessary to them; but they are wanted not for themselves, but to form convenient modes of expressing the physical facts and laws, and the interdependence of those physical facts and laws. When the student loses grip of the physical meaning of his equations and regards them only as abstractions or groupings of symbols, woe betide him. His mathematics amount to a mere symbol-juggling. This is how paper engineers are made. The high and dry mathematical master who thinks it beneath him to show a student how to plot the

equations  $y=A \sin x$ , or  $r=b \sin \theta$ , or who never culls an example or sets a problem from thermodynamics or electricity, must be left severely on one side as a fossil. Better a living Whitworth scholar than a dry-as-dust Cambridge wrangler. He at least knows that elasticity is something more real than the group of symbols  $E=p \div \frac{\Delta x}{x}$ , which any

mathematician may "know," even though he be blissfully ignorant whether the force required to elongate a square inch bar of steel by one one-millionth of its length is ten ounces or 10 tons.

One evidence of the wholesome change of opinion that is springing up concerning the training of engineers is the abandonment of the system of taking premium pupils into works with no other test or qualification than that of the money-bag. Already many leading firms of engineers have been finding that the practice of taking sons of wealthy parents for a premium does not answer well, and is neither to their own advantage nor in many cases to that of the "pupil," whom it is nobody's particular business in the shops to train. Premium pupilage is absolutely unknown in the engineering firms of the United States or on the Continent of Europe. The firms who have abandoned it are finding themselves better served by taking the ablest young men from the technical schools and paying them small wages from the first, while they gain experience and prove themselves capable of good service. Messrs. Yarrow & Co. have led the way with a plan of their own, having three grades of apprenticeship, admission to which depends upon the educational abilities of the youths themselves. Messrs. Siemens have adopted a plan of requiring a high preliminary training. The Daimler Motor Company has likewise renounced all premiums, preferring to select young men of the highest intelligence and merit. Messrs. Clayton & Shuttleworth have quite recently reconstructed their system of pupil-apprenticeship on similar lines. The British Westinghouse Company and the British Thomson-Houston Company have each followed an excellent scheme for the admission of capable young men. Even the conservatism of the railway engineers shows signs of giving way; for already the Great Eastern Railway has modernised its regulations for the admission of apprentices. What the engineering staffs of the railway companies have lost by taking in pupils because of their fathers' purses rather than for the sake of their own brains it is impossible to gauge. But the community loses too, and has a right to expect reform.

To this question, affecting the whole future outlook of engineering generally, a most important contribution was made in 1906 by the publication by the Institution of Civil Engineers of the report of a committee (appointed in November 1903) to consider and report to the Council upon the subject of the best methods of education and training for all classes of engineers. This committee, a most influential and representative body consisting of leading men appointed by the several professional societies, the Institutions of Civil, Mechanical and Electrical Engineers, the Institution of Naval Architects, the Iron and Steel Institute, the Institution of Gas Engineers, the Institution of Mining Engineers, the two northern societies, was ably and sympathetically presided over by Sir William H. White. Its inquiries lasted over two years and included the following sections:—(1) Preparatory training in secondary schools; (2) training in offices, workshops, factories, or on works; (3) training in universities and higher technical institutions; (4) postgraduate work. The findings of this committee must be received as the most authoritative judgment of the most competent judges. So far as they relate to preparatory education they suggest a modernised secondary school curriculum in which there is no one specialised scientific study, but with emphasis on what may be called sensible mathematics. They also formulated one recommendation so vital that it must be quoted in full:—

"A leaving examination for secondary schools, similar in character to those already existing in Scotland and Wales, is desirable throughout the United Kingdom. It is desirable to have a standard such that it could be accepted by the Institution [of Civil Engineers] as equivalent to the studentship examination, and by the universities and colleges as equivalent to a matriculation examination."

One may well wonder why such a reasonable recommendation has not long ago been carried out by the Board of Education. Perhaps it has been too busy over the religious squabble to attend to the pressing needs of the nation.

The second set of recommendations relates to engineering

\* From the address by Professor Silvanus P. Thompson, D.Sc., to the Engineering Section of the British Association.

training. It begins with the announcement that "long experience has led to general agreement among engineers as to the general lines on which practical training should proceed," but goes into no recommendations on this head beyond favouring four years in workshops, on works, in mines, or in offices, expressing the pious desire that part of this practical training should be obtained in drawing-offices, and suggesting that during workshop training the boys should keep regular hours, be subject to discipline and be paid wages. It then lays down a dozen recommendations as to the "academic" training suitable for the average boy. He should leave school about seventeen; he should have a preliminary year, or introductory workshop course of a year, either between leaving school and entering college, or after the first year of college training. If the workshop course follows straight on leaving school there must be maintenance of studies either by private tuition or in evening classes, so that systematic study be not suspended. For the average student, if well prepared before entering college, the course should last three academic years (three sessions); in some cases this might be extended to four or shortened to two. A sound and extensive knowledge of mathematics is necessary in all branches of engineering, and those departments of mathematics which have no bearing upon engineering should not claim unnecessary time or attention. The committee strongly recommends efficient instruction in engineering drawing. The college course should include instruction (necessarily given in the laboratory) in testing materials and structures, and in the principles underlying metallurgical processes. In the granting of degrees, diplomas and certificates, importance should be attached to laboratory and experimental work performed by individual students, and such awards should not depend on the results of terminal or final examinations alone.

All this is most excellent. It will be seen that it is entirely incompatible with the premium-pupil system, which may therefore be regarded as having been weighed and found wanting. For two things clearly stand out—that the young engineer must be college-trained, and that when he goes to works he should be regularly paid. It would have been well if the committee could have been more explicit as to the proper course of workshop training; for instance as to the systematic drafting of the young engineer through the shops—forge, foundry, pattern shop, fitting shop, &c., and as to the proper recognition of the duty of the shop foreman to allocate work to the novice in suitable routine. These are doubtless among the matters in which "long experience has led engineers to general agreement." But this being so, it would have been well to state them authoritatively. A notable feature of this report is its healthy appreciation of the advantages of training, and an equally healthy distrust of the practice of cramming for examinations. So soon as any subject is crammed, it ceases to afford a real training. "Nature provides a very convenient safety-valve for knowledge too rapidly acquired." It is even whispered that a new species of crammer has arisen to "prepare" candidates in engineering for the graduate examinations of the Institution of Civil Engineers. The distinguished framers of this epoch-making report on the education and training of engineers at least give no countenance to any such parasitical development. For the scheme of education and training at which the committee has aimed is genuinely scientific, a happy federation of the theoretical with the practical. It seeks to place the training on a broad basis, and to secure to every future engineer worthy of the name the advantage of learning his professional work in both its aspects. It seeks, in short, to take advantage of that reflex action between science and its applications in which lies the greatest stimulus to progress. Its adoption will utilise for the young engineer, and therefore for the engineering industry as a whole, the facilities for training now so widely afforded throughout the country. If the institutions, schools and colleges where engineering training is offered are but rightly developed and co-ordinated, the engineers of Great Britain need have no fear as to holding their own against the trained engineers of other countries. It is for the employers to make use of these institutions, and to show that sympathetic interest in their efficiency which is essential to their full success.

The University of Sheffield authorities invite applications before August 17 for the post of master and lecturer in charge of the department of architecture, at a salary of 200*l.* a year. The successful applicant will have to devote his entire time to the work.

## THE AMERICAN INSTITUTE OF ARCHITECTS.\*

IN the early history of our country young architects' talent came across the water to try their fortunes, and all carpenters were students who studied the various work on the orders. It was not many years before the supply of educated men ceased to equal the demand, and the builders apparently discarded all precedent and produced nothing that was beautiful, although, in most instances, it was not. This gradual decline culminated in the most debased period of architecture between 1850 and 1860. The educated men in the larger cities knew little of each other's aspirations and desires. The fear of unjust and improper treatment by other practitioners seems to have been widespread. No standard of fees or of ethics was recognised. The profession was not recognised in the community, the fine arts were thought of little importance, and constructors and carpenters as practical men were thought far superior to the architect.

Appreciating the state into which their beloved art had fallen a number of young men in New York city, after many consultations, determined to organise an association for the advancement of architecture. Their ideals were high. They were zealous and enthusiastic, and in love with the art.

The following architects—Richard Upjohn, Edward Gardiner, H. W. Cleaveland, Wray Mould, Leopold Eidlitz, Henry Dudley, Fred A. Petersen, Charles Babcock, Joseph C. Wells, Richard M. Hunt, John Welch, J. W. Priest—met to consider the propriety of organising a society of architects on Monday, February 23, 1857. They determined that such an organisation was necessary and invited Calvert Vaux, John Davis Hatch, John W. Ritch, Frederick C. Withers, Frederick D. Diaper, Joseph Sands, Thomas U. Walter, George Snell, Edward C. Cabot, Alex. J. Davis, William Backus, James Renwick, jun., R. G. Hatfield, Samuel Warner, Detlef Lienau, Arthur Gilman, Alpheus C. Morse, Thomas A. Tefft, to join with them in establishing the American Institute of Architects, and formulating the constitution. This was completed and signed April 1857. Richard Upjohn was elected president and Richard M. Hunt secretary.

The names of the founders, few of whom did not become famous in after years, deserve to be remembered and honoured by all present practitioners. When the organisation was completed the names of architects residing in New York and other cities of the country were canvassed, and only twelve architects were found whom it was thought advisable to invite to join the new Society.

The civil war came upon the country in 1861, and building and architecture gave way, as all other peaceful occupations did, to war and strife, and the Institute ceased holding its meetings until 1864. From this period until 1889 the progress of the Institute was slow; while its tangible accomplishments did not equal the aspirations of its founders, its intangible results were many and far-reaching. There was a steady growth in good-fellowship, the purity of motives of the profession became more apparent, the appreciation of the aspirations and endeavours in others led to higher aspirations and ideals. The Institute encouraged investigation and reports on construction and building topics by publishing the results of such study and research. It encouraged the highest attainments and urged a school education in architecture. Because of its encouragement and assistance the first architectural sketch-books and journals were started in the country. It made an aggressive and constant fight on improper competitions. It established a schedule of fees for architectural services. It began a library and subscribed for foreign architectural journals. Chapters were established in New York in 1867, in Philadelphia and Chicago in 1869, in Boston, Cincinnati and Baltimore in 1870, in San Francisco in 1881, in Indianapolis, Washington City, Michigan and Central New York in 1887.

The effort of the Institute to induce the Government to employ the best available talent began in 1874, by the introduction of the Field Bill, through J. L. Smithmeyer in the Forty-Third Congress. These efforts continued without apparent success, but undoubtedly each effort left its mark, and the success of to-day would not be without the early and continued efforts on the part of the Institute and its members.

The Institute began the publication of its annual proceedings in 1867. The papers read at the various conventions form a true index of the architectural practice of the

\* From a paper by Glenn Brown, secretary and treasurer.

period, many of them showing the most advanced thought the time; the early proceedings are out of print, and are in demand by libraries and institutions.

The active government of the Institute during this period was vested in a board of trustees, fifteen in number. New members were admitted as associates, with few exceptions where applicants were admitted as fellows without probation.

During this period Mr. Richard Upjohn served as president nineteen years, Mr. Thomas U. Walter ten years, and Mr. Richard Morris Hunt one year; and the following members acted as secretary:—R. M. Hunt, Henry van Brunt, Jas. D. Gambrill, Emlen T. Littell, Fred C. Withers, Russell Sturgis, jun., Peter B. Wight, Carl Pfeiffer, A. J. Root, Chas. F. McKim, Henry M. Congdon and Geo. C. Mason. The treasurers were J. W. Ritch, J. G. Wells, G. Hatfield and O. P. Hatfield.

In the year 1884 the Western Association of Architects was organized. This organization, engineered by the energetic young men of the Middle West, soon had a large membership. It was not long before the fact was appreciated by the two societies that there should be only one association of practising architects in the country, and in 1889 at the convention in Cincinnati the two associations were merged into one, holding the charter and name of the older association. The constitution was materially changed, the new government consisting of twenty-four directors, from which an executive committee of five was selected, with the president and secretary *ex officio* members of this committee. The chapter organization of the older society was retained and the grade of associate was abolished. The members of the Western Association became members of the American Institute of Architects in a body, and all were admitted as fellows and all associates of the Institute were advanced to a fellowship. Richard M. Hunt was elected president, and John W. Root was elected secretary. Under the revised constitution the president was only allowed to serve two continuous years. The membership of the Institute was materially increased by consolidation—the old membership of 338 members was increased to 476. The good feeling between the architects of the whole country was strengthened, and the good work of the Institute continued. The additions to the chapter list during this period were Buffalo, St. Louis, Kansas City and Cleveland in 1890; Pittsburg, Central Ohio in 1891; Worcester, Southern Chapter, Minnesota and Colorado in 1892; Southern California, Washington State and Brooklyn in 1894.

The effort to improve the character of Government architecture was continued by the submission to Congress of the Adams Bill, 1890, and the recommendation of J. H. Lindrum of 1891. The Tarsney Bill was introduced April 11, 1892, and passed on April 14, 1893, but its operation being left to the discretion of the then Secretary of the Treasury, Mr. J. G. Carlisle, he refused to put it into effect. The Institute, through its officers and various committees, made strenuous efforts to overcome his objections or prejudice against the law. Mr. D. H. Burnham, the president of the Institute, actively managed this movement. Upon the suggestion to the secretaryship of Mr. Lyman J. Gage, the matter was brought to his attention, and the Institute found in him a man broad enough and with sufficient artistic as well as business perception to see the advantage that would accrue to the Government and to his administration and help the law in operation. A sufficient number of buildings have been erected or designed to prove the great advantage the law has been to Government architectural work, as well as to demonstrate the service rendered the community and the profession by the efforts of the Institute.

The various chapters of the Institute have been called to consultation with municipal authorities when formulating regulations relating to building or municipal art. Many chapters urged their State legislatures to enact laws governing the practice of architecture. Laws licensing or regulating the practice of architecture have been passed by the States of Illinois, California and New Jersey.

During this period Richard M. Hunt, E. H. Kendall, D. H. Burnham and George B. Post were the presidents, and the secretaries were John W. Root, Dankmar Adler and Fred Stone. The treasurer was S. A. Treat. Although the membership of the Institute decreased from 1889 to 1899 from 473 members to 400, its prestige, notably for work in securing the passage of the Tarsney Act, the character of the papers read, and in the organization of an International Congress of Architects in connection with the Columbian Exposition, 1893, added materially to the standing and influence of the Society.

#### *Government by Delegates.*

At the convention of 1898 the constitution was materially modified. After that period all conventions were to be composed of delegates from the various chapters in proportion to the members of the Institute belonging to the chapter. The board of directors was reduced from twenty-four to nine in number. The grade of associate members was re-established and new members were required to enter through this grade. The outcome of the changes in reference to delegates and associates has proved the wisdom of this action.

It was an early custom of the Institute to hold its conventions in various sections of the country. The first, second and third conventions were held in New York in 1867, 1868 and 1869, and the same city has had the thirteenth and fourteenth, 1879 and 1880, the twentieth in 1886 and the twenty-eighth in 1894.

These conventions have always had interesting topics for the profession before them. They have been the means of social intercourse, and have given an opportunity for the members of the profession from various parts of the country to become acquainted with each other and interchange views on practical and professional topics, which have undoubtedly been of advantage to the profession at large. Many valuable papers have been read and questions of value to the architectural profession formulated and settled.

Since the establishment of the delegate system the character of the papers and the objects attained have made the Institute a notable factor in the advancement of questions pertaining to architecture.

Many conventions have been notable because of the movements initiated or of the work accomplished.

The members of the Institute have been peculiarly happy in their selection of presiding officers. The list of past presidents includes the men most notable in the profession at the time they served, but few of their names are destined to die when the architectural history of this country is written.

Richard Upjohn—1857 to 1876. Most active in the foundation of the Institute and earnest in his ideals of beauty and practice. He was the most noted among the architects of the Gothic revival and has left many examples full of ecclesiastic spirit and picturesque beauty. The dignity and beauty of Trinity Church is an all-sufficient monument to his name.

Thomas U. Walter—1877 to 1887. One of the founders of the Institute, a noble looking man whose appearance was an index to his character and work. A master in Classical architecture, he gave us Girard College, and showed his breadth and wisdom in adding the dome and wings to the Capitol, adding beauty and life and giving future generations one of the great architectural monuments of the world.

Richard M. Hunt—1888 to 1891. He was a founder of the Institute, affable and charming in his personality, enthusiastic and persistent in all that pertained to the advancement of his beloved and allied arts, unrivalled in this country for his treatment of buildings in the French chateau style, honoured abroad by election as honorary corresponding member in the Société Centrale des Architectes, the Royal Institute of British Architects, Chevalier of the Legion of Honour, and Gold Medallist of the Royal Institute of British Architects. His administration building at the Columbian Exposition, and Biltmore in North Carolina and other notable residences will carry his name to future generations.

Edward H. Kendall—1892 and 1893. He was always zealous, painstaking and enthusiastic in his work for the Institute for thirty years, endeared to all who knew him by his charm of manner, never tiring or discouraged. To him must be given largely the credit of securing the passage of the Tarsney law, the administration of which is producing such successful results.

Daniel H. Burnham—1894 and 1895. He has been noted for his executive ability and thorough grasp of broad artistic effects combined with utilitarian results. The breadth of his character and the power of his executive ability was shown in the management of the Columbian Exposition in Chicago in 1893. This will remain one of the ideal architectural achievements of the age, and the completed result will be remembered as his achievement. His work on the Park Commission of Washington, Manila, San Francisco and other cities, the Pennsylvania Railway Station in Washington, and many great business structures will make his name memorable.

George B. Post—1896 to 1898. He has been a zealous worker in the Institute for forty years. When the

magnitude of his business interests are remembered, it will be seen that he has shown a disinterested zeal for the advancement of the profession that is rare. He has been honoured by election as honorary corresponding member of the Royal Institute of British Architects, Chevalier of the Legion of Honour, and member of the permanent committee on International Congress of Architects. He will be remembered for his many large and costly business and residence structures as well as for the manufacturers' building at the Columbian Exposition, the college of the city of New York and the Stock Exchange of New York.

Henry van Brunt—1899. A member of the Institute in 1857. He constantly and faithfully served the best interests of the Association from that time until his death in 1903. His charm of manner has endeared him to all with whom he came in contact. His work has extended from the East to the West, and shows education and refinement. His various essays on architectural subjects are charming as bits of literature and valuable as works of reference.

Robert S. Peabody—1900 and 1901. His name has been honoured by the profession for twenty-five years as representing high ideals in practice, consideration for the rights of others, and refinement and culture in design. He has endeared himself to the members of the Institute by his never-failing courtesy, consideration and efficient management in the executive office. His many residences and business structures, his work at the Columbian and Buffalo Expositions, and his connection with the municipal improvement of Boston will always be remembered as among the artistic achievements of the times.

Charles F. McKim—1902 and 1903. He has been known for years, and will continue to be remembered in the architectural history of the country for ability in massing and grouping, care and beauty in detail and refinement, harmony and conservatism in his completed structures. He has been honoured abroad by election as honorary corresponding member and Gold Medallist of the Royal Institute of British Architects. He will be remembered in history by the Boston Public Library, the Columbia and Virginia Universities, the agricultural building in Chicago, the charming restoration of the White House, and the effective and monumental designs for the future development of Washington city, as well as for the establishment of the American Academy in Rome for advancement of architectural study.

William S. Eames—1904 and 1905. He represents the high achievements attained in the Mississippi Valley. His administration was memorable for broad and comprehensive business methods and unflinching attention to his duties. He will be remembered for his efficient action in preserving the Mall from the encroachment of the agricultural building and guiding the proposed additions to the Capitol. He has been honoured by election to the permanent committee on international congresses. His name will be remembered through many commercial structures, the United States Penitentiaries at Fort Leavenworth and Atlanta, the United States Custom House in San Francisco, his building at the St. Louis Exposition, and his connection with the group plan of St. Louis.

#### *The Future of the Institute.*

Mr. Thomas U. Walter said years ago:—"The improved and improving condition of architecture (in America), by which its standing as a fine art is developed, its field of design expanded, and its power to elevate and purify the public taste made manifest, is the result, directly or indirectly, of the labours and influence of the American Institute of Architects."

The membership, both in numbers, character and standing, has now reached such a point that the opportunity of the Institute for good and successful accomplishments is greater than it has ever been.

As it has always striven it will continue to strive for a more perfect attainment of the ideal in design, advancement in education, improvement in competitions, or the final abolishment of such sources of worry, improvement in practice and ethics, treatment of landscape in harmony with buildings, and municipal and city improvements. With increased membership and added prestige its opportunities for good should be far greater in the future than in the past.

The Mrs. Craigie Memorial Committee have decided to entrust to Mr. Alfred Drury, A.R.A., the commission for a portrait plaque of the novelist, a replica of which will be sent to the United States.

#### EXCAVATIONS AT SPARTA IN 1907.

IN a paper read before the British Association by R. Dawkins, M.A., director of the British School of Archaeology, Athens, he said the work of this season comprised (1) the further excavation of the sanctuary of Artemis Orthia, (2) the partial excavation of the sanctuary of Athena Chalkioikos and (3) the tracing of the course of the city wall.

(1) The buildings of the Orthia site are at a temple probably in the sixth century B.C. and lasting on until the third century A.D., although rebuilt during the Hellenistic period. Secondly, a Roman theatre, built at the end of the second or beginning of the third century A.D., in which the façade of the temple was included, occupying the position of the stage building. The Roman theatre has now been completely cleared. In the arena or orchestral area were found the remains of the altar, built at the same Roman period as the theatre itself. Beneath this altar were blocks that belonged to the altar of Hellenistic times, and in connection with them a deposit of burned refuse from sacrifice and some late Greek sherds and terra-cottas.

More than a metre below the Hellenistic level a deposit of archaic Greek objects was reached; this has now been cleared down to solid earth all over the arena and inside the temple. Above the archaic deposit was a layer of sand which had been brought from the river to raise the level when the temple was built—probably, to judge from the objects found in the sand, about the middle of the sixth century B.C. The deposit below the sand is in parts much as a metre thick, and ranges in time from the eighth or possibly the ninth, century to the middle of the sixth century B.C. Very near the bottom of this structure is a cobble pavement on which stands a large altar built of stones in regular courses. This altar is directly below the Hellenistic and Roman altars. The temple that existed contemporaneously with this altar has not yet been found but there are indications that its remains are below the foundations of the Roman building. The archaic altar was surrounded by a mass of burnt matter, amongst which were a quantity of fragments of burnt bones. The archaic deposit contained a great quantity of small objects and pottery. It was dug in layers, with the result that at the lowest levels no pottery except geometric was found; above this geometric was mixed Protocorinthian and ware akin to Corinthian, whilst at the highest level nothing but this last kind occurred. With the pottery were found a large number of small bronzes, pins, fibulæ and animals, lead figurines and carved ivory. These latter were either small figures of animals or men in the round, seals with devices cut in intaglio, plaques with scenes carved on them in relief. Many, if not all, of these plaques were fastened by bronze rivets on to the front of fibulæ. The subjects represented on them comprised male or female winged figures grasping birds, a warrior stabbing a gorgon, a dead man on a bier, a ship with full rigging and crew, sphinxes, a man on horseback, and other Jewellery, engraved gems, terra-cotta figurines, some representing probably the image of the goddess, fragments of terra-cotta masks, and other objects were also found. The occurrence of amber, in view of the northern origin of the Dorians and its rarity on classical sites, is of great interest.

Thus the cult of Orthia began in the earliest times with a large altar. This altar was covered up when the temple corresponding to it was destroyed in the sixth century and a new temple built a little way off. In Hellenistic times this temple was rebuilt, but lasted on on the same site until the end of paganism. Under the late Empire it was surrounded by a theatre, from which the rites performed in front of it could be conveniently witnessed. The altar always was in the same place, which it occupied with ever rising level for at least 1,100 years.

(2) The sanctuary of Athena Chalkioikos was found behind the theatre on the Acropolis Hill. A mass of geometric pottery shows that this sanctuary also goes back to a very early period. The building itself was much destroyed, but the finds were important. A very fine Panathenaic amphora, bronze statuettes and a large archaic inscription were found.

(3) The work of tracing the course of the ancient city wall was continued. This has again been done largely by the discovery of tiles stamped with the information that they were public tiles used for the walls. The name of the tyrant Nabis found on some of them connects the building of the wall with him. In a few places the actual wall has been found with remains of towers.

In looking for the Agora some Hellenistic tombs were found, well built of ashlar and containing vases and discs of stout gold-leaf chased with patterns of wreaths and flying birds.

The other members of the expedition were Messrs. G. Dickens, J. P. Droop, H. J. W. Tillyard, A. J. B. Wace and A. Woodward. The architectural drawing was undertaken by Mr. George and the surveywork by Mr. W. Sejk.

### LADY STAIR'S HOUSE, EDINBURGH.

ONE of the old houses remaining in Edinburgh is known as Lady Stair's, from the Close in which it stands. It was erected in 1622 by Sir William Gray, of Pittendrum, and it is known from the lintel, on which is inscribed "Fear the Lord & depart from Evil.—W. G., 1622." He was a royalist, and a fine of 100,000 marks was entered against him for corresponding with Montrose. A daughter of Gray married Sir Archibald Primrose, and in that way it passed to the Rosebery family. The Lady Stair having married the first Viscount Primrose afterwards resided in the house, and the Close in the Lawnmarket was called after her. Scott's weird story, "My Aunt Margaret's Mirror," is founded on an incident in her life. In a letter to the Lord Provost of Edinburgh on the 16th ult. Earl Rosebery wrote:—"I have always intended to offer Lady Stair's house to the city of Edinburgh, and have so disposed of it in my will. But as I think it might be made immediately suitable for the purpose of your Municipal Museum, I am anxious to place it at once at your disposal—and in the ownership of the Town Council, should they do me the honour to accept it. It will be a very inadequate mark of the loyal affection and gratitude I feel for Edinburgh."

The house was restored by Lord Rosebery in 1897. His architect was Mr. George Shaw Aitken, and the form it has now assumed, says the *Scotsman*, may be accounted for by the fact that there was an idea that it might be used by Lord Rosebery himself as a lodging when he was in Edinburgh. That, of course, was never carried into effect. As Chambers says, the house has undergone a good many transformations from the time it was originally built, but in its restoration as many of its original features as could be discovered were preserved in fitting the building to resemble a town mansion of the seventeenth century. Two wings had been added to the original house on the south side and on the north side, the latter completely hiding the main building from view. Both were removed at the time of the restoration so as to open up the house to light and air. When the adjoining James Court block was erected some time in the eighteenth century two flats had been added, each containing two handsomely-panelled rooms, and these have been retained. The house can now be seen from North Bank Street in a gap between two tall tenements—that on the west side being eight storeys—over the roof of a portmanteau-making establishment of two flats. The original moulded doorway is still extant. It has over it the inscription mentioned in the opening sentence of this article. The original stair-angle tower is octagonal in form, and it has now been carried up beyond the wall head, and finished with a corbelled balcony and bell-shaped roof. This is a prominent architectural feature of the elevation. The southern face of the house is entirely new, a feature of it being a balcony at the upper flat. On the east side we have the original walls, and there is an original long window carried through three floors, with gablet, the finial of which is an old stone found at another part of the building, on which is carved the fleur-de-lys. Underneath a tall chimney-stalk, on the upper side of this window, is an ornamental panel recording the date of the erection of the building and that of its restoration, with the Stair and Rosebery arms in medallions in the centre. The north front is also entirely new. It shows the windows of the dining hall on the lower level, and above, enclosed in a long recessed arch, the windows of the upper flats, one of which has a balcony. It is finished with gable with crow-steps, and flanked by two tall chimney-stalks, on which respectively occur the letters "S" and "R"—for Stair and Rosebery. The walls are of rubblework, and the jambs of the windows and the corners of the towers and other angles are of dressed ashlar—some of it dating from the erection of the house. Internally, the house consists of the basement, transformed into a modern kitchen, the dining hall, practically on the Close level, rising through two storeys, and two flats of rooms above. The basement is connected with the flat above by two original stairs. A fine feature has been made of the dining hall, which

is between 30 and 40 feet in length by 15 feet in width. Note may be made of the old-fashioned open fireplace in the right wall, which has been fitted with the original pillared jambs and lintel. On it has been carved a pious inscription characteristic of the period—"Blissit be God for all His gifts." It may be noted that at different parts of the hall appear painted mottoes of various kinds, also culled from old Edinburgh houses. In the north window is stained glass, with the Stair and Rosebery arms. Hard by this window is a small fireplace, with wooden mantel of the Adams period. On the left side of the room is an open balustraded balcony in wood, which had to be made to give a connection with the west side of the house, but which forms a decorative feature of the hall. The ceiling in plaster is panelled, with wooden ribs, and in the centre of the compartments are appropriate devices in colour. The upper floors are reached by a circular stone stair ("a turnpike"), but there is nothing associated with them calling for any special remark. On the third floor the rooms are larger than those on the flat above. A room to the north, with balcony, had been specially set apart as Lord Rosebery's bedroom, and from it a splendid view can be obtained of part of the New Town, the Firth of Forth and Fife.

Two interesting points may be noted—that the wine bins of the original house were built of Dutch bricks, and that a device of two clasped hands (symbolical of the joining of hands across the centuries by the restoration of the house) on one of the outside panels was copied from a lead fire-plate found outside one of the upper windows. It was of the date 1720, and was one of the plates of the Friendly Insurance Society of Edinburgh, the first Scottish fire insurance office.

At present the house is occupied as temporary offices of the United Free Church, and will no doubt remain so until the new church offices in George Street are ready.

### NEW USES FOR REINFORCED CONCRETE.

SO many papers have been read of late discussing the general principles governing the design of reinforced concrete structures and describing works of familiar character in which reinforced concrete has been adopted as the material of construction, that Mr. W. Noble Twelve-trees thought it well to follow a less frequented path. Under the heading of "New Uses for Reinforced Concrete," read before the British Association, he considered some types of construction that have not yet been applied in this country, others that have been adopted only recently and others again that are not new in themselves, but are very suitable for employment in novel directions.

In the first category may be placed such constructions as railway sleepers, standards for overhead electric cables in power transmission and electricity distribution systems, and poles for telegraph and telephone wires. The paper contained particulars relative to the design, construction and application of such accessories as these, which are now coming into general use on the Continent and in America.

In the second category was considered the employment of reinforced concrete in dock engineering, as illustrated by the Scotstoun Dock on the Clyde—the first example of its kind in Great Britain; of coast defence and harbour-works, as illustrated by the sea wall and protective slopes at West Hartlepool, groynes near Brighton and a breakwater near Waterford; and of long-span bridges for main-line railway traffic and for crossing important rivers, as exemplified by typical structures in this and other countries.

In the third category the author indicated the special advantages to be obtained by the adoption of reinforced concrete as a material for the construction of railway station roofs, locomotive depôts and bridges over railway lines. In all such structures steelwork is particularly liable to corrosion by reason of its exposure to steam and destructive gases from locomotive engines and boilers. To illustrate the adaptability of reinforced concrete to these new uses, the author gave brief particulars of roofs that are akin to those generally built in steel for covering railway stations, of a locomotive depôt erected on the Jura-Simplon line and of highway and footbridges over railway lines.

Finally he alluded to the method successfully adopted on the Continent for preserving steel bridges by encasing them in concrete, a course that is commended to the attention of railway companies and highway authorities in places where the corrosive effect of locomotive fumes is a constant source of trouble and expense.

## EGYPTIAN SOUL-HOUSES.

AN address was delivered before the British Association by Professor W. M. Flinders Petrie on Egyptian soul-houses and other discoveries made in Egypt in 1906-7. He said that the existence of pottery models of houses for the soul had been known from stray examples scattered in museums, but their date and use had been alike unknown. Last winter the British School of Archæology in Egypt, working at Rifeh, near Asyut, disclosed a long series of such models which had shown the gradually increasing complexity of the type of houses that were copied. The whole period of these soul-houses was probably of the tenth to twelfth dynasties, about 3600 to 3300 B.C. The variety of form could not be due to development of the dwelling during that time; but all the forms of dwelling were used for different purposes simultaneously, and more complex forms were being copied in each generation for the soul-house. The development of this custom appeared to have been in the following order. At first, from the prehistoric age to the fifth dynasty, a mat was laid on the grave with a pan of food upon it. Then, afterwards, this offering was carved in stone, from the third dynasty onward, as a table of offerings to give permanent satisfaction for the soul. The stone table was then copied as a pottery tray of offerings by about the tenth dynasty. To the tray was next added a shelter, copied from the Bedawy tent, next a shelter on columns, then a hut was put into this portico, then chambers were copied, wind openings were then added, roof-courts followed, and then verandahs on the roof; next appeared complete two-storey houses, and these, lastly, were furnished with pottery models of couch, chair, stool, fireplace, water jars, and the figure of a woman making bread. This class of models was not in series with the wooden models of servants, granaries, &c. Such were part of the servitor provision placed in the grave. These pottery houses were the provision for the use of the soul itself placed upon the grave, to keep the soul satisfied, and prevent it from wandering back to the village. The interest in psychology was in showing that the soul was conceived of as ascending from the grave through the ground and needing shelter while feeding on its everlasting provision; and that, though it ascended through the earth, yet it needed a staircase to go up to the upper floor, and that the soul had a donkey for which a manger was required. More strictly one should say that these models illustrated the way in which the Egyptian copied and combined things that were logically quite incompatible. Given the premise that the soul had needs in future, like those of the present, then the provision for present comfort was copied without further thought as to its compatibility. From another point of view these models showed the varieties of the peasants' dwellings, some merely as shelters for the day in the fields, others such as were used for a month or two of the pasture season, and the more complete, such as belonged to village or town life. The portico or verandah was the most essential part, and this agreed with its being universal for the house of the god—the temple, and for the eternal house—the tomb. Another constant feature was the tank in the courtyard, as in Oriental houses at present, and as in the houses contemporary with those models at Kahun. In some cases the courtyard wall was crowned by serrations or piles of brick along the top, and a similar finish to the walls might be seen in the tombs of the modern cemetery of the same place.

## SOUTERRAINS IN ULSTER.

THE souterrains described by Mrs. Hobson in a paper read before the British Association are for the most part situated in the two counties of Antrim and Down. The materials are rough, undressed field stones, no mortar being used. The buildings display great diversity in plan, some being merely oblong chambers and long passages; others crescent-shaped, some resembling the letter F, the same letter without the middle stroke (Γ), an inflated stocking, an uneven capital W, &c., and some are circular.

Greater variety of construction occurs in Antrim than in Down. In the former, two described were scooped out of basaltic ash; in others, rocks *in situ* were used and filled in artificially; in some tunnelling had been done in harder rock. The entrances are small, but the tiny doorways between one chamber and another are even of more diminutive dimensions—great numbers being too small to admit the average-sized man—a person having to lie down flat in order to get through, and even then the width will not

allow other than the shoulders of a woman or boy to pass through.

Tradition assigns the souterrains and the raths in which so many of them occur to the "fairies," the "good people," the "Danes"—and by the latter is meant the Tuatha da Danaan, who are said to have lived in Ireland before the Celts. This race is always described as a small people. It seems impossible that any but a small people could have built and used the souterrains.

The souterrains in co. Down run to a greater length than those of co. Antrim; many are over 100 feet. Ardtole is 108 feet long, Rathmullan 120 feet, Slieve-na-Boley 128 feet. Heights of chambers vary from less than 3 feet to 6 feet and even 8 feet, but it is more usual to find them about 5 feet. The heights of the chambers of one at Shankbridge are as follows:—First chamber, 3 feet 9 inches; second chamber, 4 feet 6 inches; the last about 3 feet, one of the "doorways" being 17 inches square.

At Donegore and Ballymartin, in Antrim, are two caves scooped out of basalt ash. The former is 29 feet 3 inches long; the latter has a total length of 44 feet 6 inches. The stones which form the roof are very large. Their preservation in such numbers can be accounted for partly by being underground, but chiefly by the superstitious reverence with which they have always been regarded.

The structures are quite dark, of an even temperature, usually very near the surface, which accounts for many being accidentally discovered, the plough often displacing one of the covering stones. They are not oriented, yet few entrances can be successfully photographed during the middle of the day, and, in addition, they are so cunningly constructed and concealed as to be in most cases very difficult to find. In these counties the roofing stones are very large, while further south occurs a circular type, with overlapping courses and closed with a single stone, as in some of the tumuli, both sorts determined, no doubt, by the materials lying close to hand.

Very frequently a variety of monuments of early man are found in the vicinity—standing stones, cromlechs, kistvaens, and occasionally kitchen-middens. The only ogham inscription found in Ulster was discovered in a souterrain at Carncomb, Connor, by the Rev. W. P. Carmody, B.A.

Detailed measurements were given, with plans, of the following:—Knockdhu, Cullybackey, Tannybrack, Fort Hill, Lisnataylor Fort, Crebilly, Shankbridge, Fort of Ross, Muckamore, Donegore, Ballymartin—all in Antrim; and Ballygrainey, Backaderry, Clannagery, Slanes, Lough Boley, in Down, &c., and one at Lucan, in co. Dublin.

## TEN YEARS OF REGISTRATION.

A COMMUNICATION received by the Chicago Architects' Business Association requested answer to a list of questions concerning the practical workings of the Illinois license law during its ten years of operation. The answers embrace the information and observation of the secretary of the Illinois Board of Examiners of Architects, Mr. Peter B. Wight, and therefore are authoritative. The questions and answers are as follows:—

## Questions.

1. Did your Association favour registration or licensing of architects before the law was passed in your State?
2. Do you favour such legislation in principle now?
3. In the operation of the law in your State as you have seen it, how has the law benefited the public?
4. How has the law benefited the profession?
5. If you favour a registration law in principle what features of your law, if any, would you wish to see changed?

Any concrete instances of the effects or working of the law which have come to your knowledge would be of value.

## Answers.

Answering the queries in order:—

1. Our Association was originally organised for the express purpose of securing the passage of an architects' license law.
2. At the April meeting of the Association this question was submitted to a vote of the entire meeting, and was unanimously carried in endorsement of our present license law. It was emphatically emphasised, however, in the discussion that while the law was of incidental benefit to the architect, its real value and the only logical ground

for its support was its benefit to the general public, by securing at least a moderately competent chief officer in charge of the design, and having supervision over the construction of buildings.

3. It has placed at the disposal of anyone, in case they wish to engage in building, competent expert advisers who are made responsible to the State for the character of service rendered. It also enables discipline and punishment in the case of dishonest, reckless or incompetent practice, and gives the public some redress in such case. Men who are naturally dishonest or reckless are restrained in their natural tendency through fear that their license to practise may be revoked by the State board. Men who know themselves to be incompetent in certain particulars through the same fear are compelled to procure competent advice on questions which they feel uncertain about, thus securing to their clients competent service. The importance to the public of having buildings erected after plans prepared by architects examined and licensed under the laws of the State of Illinois has been so impressed on the City Council of the city of Chicago that they have laid down a requirement in the municipal code requiring that all plans having area in excess of 1,200 square feet must be prepared by a licensed architect, signed and sealed by him, as a pre-requisite to secure a permit for the erection of a building within the corporate limits of the city. A movement which is not yet accomplished is on foot to make it obligatory to require all buildings erected within the city of Chicago to be constructed under the authority or general supervision of an examined and licensed architect. This movement had its original inception as a result of public demand for a greater safeguarding of life and property in the great factories and warehouses which have been frequently erected without the supervision of an architect.

Through the recklessness and desire to economise on the part of interested builders, buildings have frequently been constructed faultily, resulting in serious accidents. The chief opposition to this movement has come from speculative builders, who do not care to have their work submitted to the inspection of competent experts, for reasons which are evident.

4. The law has benefited the profession of architecture by securing public recognition of same and by purging it from the reckless and incompetent, elevating its tone and character. The law is a police regulation and must be based on public benefit, not class benefit. The only ground on which the law can be supported is on the ground of protection to the general public, in the security to the lives and health of the workmen engaged in the erection and the future occupants of the building. Fortunately, however, we have found that this public benefit has actually been a professional benefit.

5. The present law in this State has been revised and amended, until it is now very satisfactory. Any new law in other States should embody the Illinois law with all of its amendments.

We enclose copy of a circular letter prepared by the Secretary of the State Board for the examining and licensing of architects, which will explain the Illinois law more fully.

(Signed) PETER B. WIGHT,  
EMERY STANFORD HALL,  
Secretary C.A.B.A.

### SCHOOL BUILDINGS.\*

AS we shall have the opportunity of listening to several papers which will deal fully with the technical parts of the subject before us, I propose only to touch on certain points which may not be dealt with in the papers which are to be read, but which strike me, as an architect, as being of some interest.

In designing school buildings, the architect is generally obliged to limit his expenditure, so that there are seldom opportunities for much ornament or display. This in itself is not a disadvantage. There is no necessity for elaboration of design, but fine architecture is always desirable, and it is quite possible without rich and expensive detail. In every school building, however simple in general construction, there should be at least one feature of architectural worth. Should this be a fine doorway or any other detail, let it be good enough to be a source of pride to the school. An important factor in education is the development of that appreciation of beauty in art or nature which is latent in

most of us. If school teachers can learn to be proud of some part or feature in their building they can probably inculcate some such feeling in their scholars. I believe that a sense of admiration for the handicraft of others leads to emulation of the right kind, and a fine example in stone or woodwork may prove of great educational value to our budding craftsmen.

Another point on which I should like to touch is the finishing of the walls in classrooms, &c. With all due deference to sanitary and hygienic opinion, I feel I must protest very strongly against the use of glazed surfaces in schools and classrooms. Perfect as glazed tiles are in every way when used in legitimate positions for lining lavatories, cloak-rooms, &c., they are inappropriate and unsightly as wall decoration for living rooms. My own experience in a certain room lined with faience has been that of discomfort and irritation. Being, as you will allow, something of an expert where domestic architecture is concerned, I was able to trace the cause of my discomfort to the glaze of faience. Surely children, without knowing whence the depressing influence arose, might be quite as much affected by it. Too much stress cannot be laid upon the importance of having warm and pleasant colouring upon the walls; the cold and drab colours which are so much used should be avoided. In London and large towns there is too much that is dismal and smoke-defiled outside, and the interiors should be cheerful. Children's eyes wander even when their attention is supposed to be engaged, and they should surely have something pleasant to look upon. Their schoolrooms, in fact, ought to be such rooms as we would not mind occupying ourselves. To illustrate my point let me draw attention to the Doss-house in Parker Street, which I saw after it had been occupied for two years. This building is a common lodging-house for the poorest classes, the charge being 5d. a night for a bed. The common-room is decorated in a way that might by many be considered inappropriate to the class of persons by whom it is used, but I consider that the money spent on beautifying has not by any means been thrown away. The whole of one end of the room is occupied by a carefully designed fireplace surmounted by a mural picture. The woodwork of the walls and of the fixed seats is of equal merit with the other work, and is painted in rich and pleasant green. This sort of decoration, without being expensive, is highly effective. When you consider the exceedingly low charge for a bed, and for the use of this room, you will realise that the Doss-house is occupied by the poorest of the poor. The casual occupant may be anyone, from the young hooligan to the most hardened vagrant, and yet after two years continual use I saw absolutely no sign of rough treatment. The painted woodwork and the walls were all in as good condition as if the room had been dwelt in by educated people. Any signs of wear visible were certainly not caused by malice, or even carelessness. It seems to me that the fact of this respect shown to a good building proves that even the minds of the very poorest may be accessible to feelings of beauty. If adults of the degraded though not criminal classes are sensitive to the influence of beauty, how much more must this be the case with the plastic mind of childhood.

There is nothing more necessary to the well-being of children than good ventilation. Of all the systems at present in use, some of which are certainly excellent, not one can be said to approach perfection. In forthcoming papers you may hear many methods strongly advocated, but I venture to assert that, whatever may be the virtues of such systems, all will leave something to be desired. Architects agree that open fireplaces and open windows are essential supplements to any other kind of ventilation. All who have to do with children know that they thrive best in the open air. Doctors insist on open air for anæmia and chest disease and for minimising the risk of any sort of infection, and no system of ventilation has yet been discovered to supersede the open-air treatment for consumptives. If prevention is better than cure it behoves us to see that the children of the nation are taught as much as possible in fresh air. As a matter of example, it is desirable that children see that frequent changing of the atmosphere is insisted on in the classroom. No patent system of ventilation will teach them the valuable lesson that they may learn by seeing the importance of having the windows open. As well teach them to cook by electricity, and then let them go back to their own cheap stoves, as expect them to learn the rudimentary hygienic truth that fresh air is essential in a classroom where the windows are all kept shut.

\* An address by Mr. T. E. Collcutt, P.R.I.B.A., delivered at the International Congress of School Hygiene.

## AYR AULD BRIG.

THE first report of Mr. W. S. Wilson, C.E., Glasgow, to the committee in charge of the preservative operations at the Auld Brig, states:—"The work was begun on May 13, when four masons were put on to clean and refill with pure cement all joints in the south arch and pier. A week later other four masons were started, and since then these eight men have been steadily employed pointing and renewing defective stones where this could be done with safety. At this date nearly one-half of the bridge has been pointed. The bridge was closed to the public on June 10, and men were immediately started to lift the roadway so as to expose the arch-stones of the south arch. The points between the arch were then cleaned out and filled up with cement and fine concrete. Afterwards a layer of concrete 9 inches thick was spread over the whole surface of the exposed arch. Concrete walls built across the bridge have been completed at the south arch abutment, and also at the first and second piers. The central spandril wall has been finished on the south arch. The second arch has been opened up, the joints cleaned and filled with cement, and the 9-inch covering of concrete is in course of being put on. In addition to the eight masons there are eleven labourers on the work. There have been no accidents of any kind, and everything is proceeding satisfactorily."

## ENGINEERING LABORATORY, FINSBURY.

THE recent extension in the department of mechanical engineering at the City and Guilds Technical College, Finsbury, has been provided for by the City companies aided by a private donor. A new wing has been added to the college, in which accommodation has been found for an engineering laboratory, drawing offices, lecture and preparation-rooms. The principal feature of interest is the engineering laboratory, of about 4,000 square feet in area, on the basement floor. A part of this laboratory has been devoted to hydraulic equipment, which is mainly grouped with reference to a cast-iron channel, 80 feet long, and of square section 2 feet side. At one end of this is a space for a vertical pressure cylinder, for experiments on jets, impact on vanes and the like. At the other end are measuring tanks of a total capacity of 3,500 gallons, into which the water drains after passing over a weir in the main channel. There are also two subsidiary channels, parallel to the main one and draining directly into the measuring tanks. The water after use is raised to a roof tank of 5,000 gallons capacity by a centrifugal pump of 200 gallons capacity per minute, and it is returned to the laboratory by a falling main for use anew. The hydraulic machines already installed comprise an inward-flow pressure turbine, an outward-flow Girard turbine, a Worthington pump, a three-cylinder hydraulic engine, and a considerable amount of other apparatus for experimental work. The heat engines are all of moderate size, and are in most cases of special design for experimental work. A gas-engine of 12 horse-power is fitted for work with either town gas or suction gas from a Dowson producer. A refrigerating plant is arranged to work with either carbonic acid or ammonia by using interchangeable cylinders. An oil-engine, hot-air engine, steam-engines, and a compound air-compressor are also installed, while space has been left for future developments. The equipment also includes a 10-ton Buckton testing machine and a varied collection of other apparatus for testing materials. The drawing office has accommodation for 100 students, and is divided by a glazed partition for convenience in teaching. The workshops have been entirely remodelled, and nearly all the old machine tools have been replaced by new ones. A new lecture theatre seats 100 students, and is fitted with the necessary appliances for experimental and lantern demonstrations.

## GENERAL.

Mr. Carnegie has agreed to contribute 2,000*l.* towards the erection of a library at Bray. A site for the building has been offered on the Tickell estate.

A Design by Mr. T. G. Abercrombie, architect, Paisley, has been selected by the directors for the industrial school which is to be erected at Thornley Park.

Mr. James Brennan, R.H.A., who was during several years headmaster of the Metropolitan School of Art, Dublin, died on Tuesday. He was born in 1837, and in his twenty-third year was appointed headmaster of the Cork School of Art.

Mr. M. E. T. Wratlaw, solicitor, at the Divisional Petty Sessions, Rugby, presented plans on behalf of Mr. A. F. Cross for a new theatre in Albert Street, and the magistrates expressed their approval.

Sir Douglas Fox, presiding at a meeting of the Improved Industrial Dwellings Company, said the Board had decided to take a small portion of the Hampstead Garden City property and erect cottages, so as to be able to provide country cottages for working men at a reasonable rent within twenty minutes of Charing Cross.

The Board of Trade are about to constitute a special temporary branch for the purpose of dealing with matters relating to London traffic so far as they come within the scope of the Board. The branch will be under the direction of Colonel Sir H. Jekyll, K.C.M.G.

The Dorset Antiquarian Field Club have decided to join with the British Archaeological Association, who recently visited the historic spots in South Dorset, in opening out certain sections of the Roman amphitheatre at Dorchester, and at Poundbury an ancient encampment near the town, in order to ascertain more correctly, if possible, the real nature of these interesting earthworks. A joint committee of the two bodies will be formed to supervise the spade work, and as a guarantee to the public that it will be done in a scientific manner by responsible persons.

The Council of the Institution of Civil Engineers will consider applications for a nomination to a Palmer Scholarship. The nominee must be the son of a civil engineer, he must be desirous of matriculating and subsequently graduating at the University of Cambridge, and his circumstances must be such as to need the help afforded by the scholarship. The scholarship is of the annual value of 40*l.*, and will be vacant at the end of September. Copies of the regulations may be obtained from the secretary.

The Executive Committee of the Liverpool Cathedral have decided upon recognising within the edifice memorials of dead people whose relatives or friends desire to make donations to the cathedral in memory of the departed. The committee have resolved to place a brass tablet at the back of the sanctuary, or in some other suitable quarter, whereon will be inscribed the names of those in memory of whom sums of 500*l.* and upwards are given.

The Grand Prix de Rome scholarship in painting has been awarded to M. Billotey. The Grand Prix de Rome for 1904, which was not awarded in that year, has been awarded to M. Aubry. The winners of the two second Grands Prix de Rome are:—1st, M. Fedrit; 2nd, M. Darrieux. The prize for sculpture has been withheld.

An Ivy Plant growing in a crevice of the tower of St. John the Baptist's Church, Yarborough, Lincolnshire, has caused such damage that an architect who has been consulted estimates that 600*l.* will be required to put the tower in a thoroughly good state. The roots undermined the foundations, gradually lifting the stones out of place, and a large crack in the walls resulted from the growth of the plant.

An International Congress for the development of drawing and art teaching will be held in London during the first week of August 1908. Two such congresses have previously been held, the first in Paris in 1900, the second in Berne in 1904. The Congress, it is expected, will bring together representatives of drawing and art teaching from all parts of the globe, and in connection therewith a large and comprehensive exhibition is proposed, which will show the methods of art teaching pursued in the various countries of the world. Applications for space and inquiries have already been received from Germany, France, Russia, Italy, Austria, United States, Egypt, India, New Zealand, Newfoundland and many other places. The chairman of the British committee is Sir John Gorst, and the vice-chairman, the Earl of Carlisle. The organising secretary is Mr. C. M. Mathews, 151 Cannon Street, London, E.C.

The Earl of Moray, it was mentioned on July 12, had offered to restore the old Restalrig chapter-house of the Edinburgh Presbytery. A petition has been presented to the Edinburgh Dean of Guild Court for warrant. Lord Dean of Guild Wilson said it was important that the city should not be led into providing drainage. The chapter-house was 10 feet below the level of the road and 8 feet below the level of the drain. He did not want the city to be run in for a new drain. The representative of the Earl agreed to sign a note on the plan guarding against this contingency, and warrant was granted.

## THE WEEK.

THE proceedings of the Hygienic Congress have suggested the defects of children which the most commodious, best drained and best ventilated school buildings cannot altogether remedy. For many, disease seems to be an inseparable companion from birth to death. A report prepared for the School Board of Glasgow by Dr. W. LESLIE MACKENZIE and Captain A. FOSTER presents the influence of what seems like fate in a manner which is startling. They have arranged schools into groups, Group A being the poorest district, and B, C and D representing lesser degrees of poverty. In Group A a large number come from tenements of one room, while in Group D there are several tenements of three rooms. According to the report, as surely as a child comes from Group A he or she is likely to be smaller and lighter than the children of Group C, and so on with the other two groups. But these facts are made more striking when the average height and weight are classified in co-relation with the number of rooms in the house. Of children of ages from five to eighteen it was found that the average weight of the one-roomed boy is 52.6 lbs., of the two-roomed 56.1 lbs., of the three-roomed 60.6 lbs., of the four-roomed and over 64.3 lbs. The respective heights are 46.6 inches, 48.1 inches, 50.0 inches and 51.3 inches. For girls the corresponding figures are:—Weights, 51.5 lbs., 54.8 lbs., 59.4 lbs. and 65.5 lbs. The heights are 46.3 inches, 47.8 inches, 49.6 inches and 51.6 inches. These figures show that the one-roomed child, whether boy or girl, is always on the average distinctly smaller and lighter than the two-roomed, and the two-roomed than the three-roomed, and the three-roomed than the four-roomed. The numbers examined are so large and the results are so uniform that only one conclusion is possible, viz., that the poorest child suffers most in nutrition and in growth. It cannot be an accident that boys from one-roomed houses should be 11.7 lbs. lighter on an average than boys from four-roomed houses and 4.7 inches smaller. Neither is it an accident that girls from one-roomed houses are on the average 14 lbs. lighter and 5.3 inches shorter than the girls from four-roomed houses. Facts like those ascertained by the reporters demonstrate the necessity of improved housing. It must be acknowledged that during many years Glasgow has endeavoured to cope with the difficulty. But the obstacles are so great, finance being one of them, it would seem as if many years must elapse before Group A with its delicate children will have ceased to exist.

IN Germany a great many of the churches are allowed to retain the ancient *instrumenta ecclesiastica* (or, in other words, valuable altar-plate), although there is no longer use for them in the reformed services. Some objects have, however, found their way to the great museum of Berlin. One is the reliquary of St. PATROCLOUS, which formerly belonged to the church dedicated to the saint in Soest. An exhibition of old West-German art was opened on Sunday last. Applications were made to allow the shrine to be sent from Berlin, and the authorities of the Kaiser Friedrich Museums agreed to the proposal. Whereupon the Berlin people suddenly resolved that as the small shrine was one of their chief treasures, it was a deprivation not only to themselves, but to visitors from all parts of the world. It is also alleged that the people at Soest are anxious to retain their property, and if they succeed an irreparable injustice will be inflicted on Berlin. In such cases it is difficult to decide where the right lies. Our Government recently compelled the Trustees of the British Museum to hand over Celtic ornaments to the Dublin Museum. And there is

no doubt it is good policy to encourage local interest in archaeology. Soest was at one time much more important than it is now, and the reliquary with the church of St. Patroclus helped to suggest the liberality of the inhabitants in spending money to support religion. But if left in Berlin a hundred students would examine the shrine for every one who cares about it in Soest.

THE proposal to erect a parsonage or Pfarrhaus on the south side of the cathedral of Worms does not meet with the approval of many of the German artists and archaeologists. The site was once upon a time occupied by the chapter-house, and it is intended to make the new residence of a similar form. The evidence on the subject is of no value, and it will therefore be necessary to imagine the appearance of the ancient chapter-house. It is doubtful whether any German architect can do more than adapt the style of the cathedral to new conditions, whilst it is likely there was no resemblance between the great church and the subsidiary building. What is feared is that the architect may be able to produce so plausible an imitation that strangers who visit Worms will, in the course of a few years, confound the new with the old work. An error of that kind has been so often committed, there is reason to fear a repetition of it at Worms. It is considered preferable by some authorities to honestly adopt a modern treatment, although it must be owned the style which is now in favour in Germany would present a strange contrast to the Romanesque cathedral.

IT is a familiar expression that a man may fire at a pigeon and bring down a crow. A case of the kind which occurred at Montreal came before the Judicial Committee of the Privy Council a few days ago. A builder in erecting a house used a derrick which, coming in contact with the overhead wires of a company, diverted a current of electricity and killed a man. His widow brought an action against the builder as well as the owners of the wires. But the jury came to the conclusion that the latter were alone liable. By the terms of their Act the company could lay the wires above ground or below ground. The jury considered there was negligence in the manner of laying the wires. In a higher Court the judgment was reversed and the action was dismissed. It then came before the Judicial Committee. Their Lordships held that it was not an open question whether the wires were above or below ground, and consequently there was no proof of negligence. The case of the appellant, the widow of the man who was killed, was therefore dismissed. What is most remarkable is the ease with which the jury exonerated the owner of the derrick.

IN 1857 the group of GOETHE and SCHILLER by RIETSCHEL was unveiled in Weimar. The work is well known through engravings and photographs. At one time there used to be discussions about the relative power of the two poets. But GOETHE said Germany should be proud to have had two such men, and the group suggests brothers rather than rivals. Originally it was intended to have the group in an open place of the park; and in RAUCH's model the two were draped in togas. It was afterwards decided to represent them in the costume of the period, and to place the group near the theatre, with which both were closely connected. That theatre having served its turn a larger structure was lately erected, and in three or four months will be opened. The Place in which it stands has been enlarged. In consequence it has been found necessary to remove the group of GOETHE and SCHILLER to a position in which it will become more central under the altered conditions. The distance which it will be removed is about 30 feet. But wherever the group stands it will commemorate the influence of the poets in elevating Weimar from a small capital to a city which has universal interest.

## THE REVEALING OF IRON.

WHEN referring to the right use of our mental faculties and the advantages to be gained from it, JOHN LOCKE said:—"He who first made known the use of that contemptible mineral (iron) may be truly styled the father of arts and the author of plenty." In the two centuries which have passed since LOCKE wrote, iron has been utilised for so many novel and beneficial purposes we may now say he could not have known the capabilities of the material. Ours is the true Iron Age, for the period which goes by that title among archæologists was merely one of infancy. Yet we are still as ignorant as formerly about the man who first revealed to an amazed people the wonderful powers which were concealed in what appeared to be only a very heavy stone. During many generations TUBAL CAIN was accepted as the great benefactor, "an instructor of every artificer in brass and iron," and the name is likely to serve as a designation for a primitive metalworker. He was celebrated in song, and GEORGE ELIOT ventured to describe him in sonorous verse as a potter and metalworker who accomplished much through realising the power of heat:—

But Tubal Cain had caught and yoked the fire,  
Yoked it with stones that bent the flaming spire  
And made it roar in prisoned servitude  
Within the furnace, till with force subdued  
It changed all forms he willed to work upon,  
Till hard from soft, and soft from hard, he won.  
The pliant clay he moulded as he would,  
And laughed with joy when 'mid the heat it stood  
Shaped as his hand had chosen, while the mass  
That from his hold, dark, obstinate would pass,  
He drew all glowing from the busy heat,  
All breathing as with life that he could beat  
With thundering hammer, making it obey  
His will creative, like the pale soft clay  
Each day he wrought and better than he planned,  
Shape breeding shape beneath his restless hand.  
(The soul without still helps the soul within,  
And its deft magic ends what we begin.)

In our time, although TUBAL CAIN is supposed to be mythical, there is no hope of becoming acquainted with the name of the first metallurgist, and indeed it would seem as if there were several independent discoverers of the service which iron could render. Engineers would now be satisfied if, leaving individuals aside, it could be ascertained what country has the claim to priority in the use of the material. At the discussion of the subject last week in the Anthropological Section of the British Association the claims of several regions were brought forward, but it could not be said that any conclusion was reached. That result was to be expected. Tradition may have its use in other matters, but in relation to archæology men now require material evidence. Objects made of iron are, no doubt, originally possessed of strength, but time resembles an excessive weight imposed upon them. Whatever is the true cause of oxidation, there is no doubt that mode of diminishing the surface of iron and its endurance has been in operation from the beginning. As a result primitive iron objects are rare. BELZONI found an iron sickle buried beneath a sphinx at Thebes, but, in spite of the protection from the air afforded by the sculptured figure, it was in pieces and almost devoured by rust. Yet he was not fully satisfied that the sickle was more than an exceptional example, and could only suppose the Egyptians must have been acquainted with iron. HERODOTUS, it is true, confirms the conclusion in favour of iron by mentioning iron hooks and other instruments, but his visit was at least four centuries before our era, and in one sense Egypt was then advanced in science. Any archæological problem which is supposed to be worth the attention of the British Association should relate to a far more remote time.

Professor RIDGEWAY, who opened the discussion on the subject, maintains that the iron which was used in

Egypt twenty-five centuries ago was hematite, and that it was not smelted but worked like ordinary hard stone which had to serve for weapons or ornamental beads. Such a scene as GEORGE ELIOT described would therefore be imaginative. Professor RIDGEWAY supports his view by referring to other parts of Africa. Iron was said to be unknown in Uganda up to four or five centuries ago, and it was long unknown in Central Africa. Professor PETRIE, on the other hand, maintains that iron belonging to periods from 4700 B.C. until 1100 B.C. has been found recently in Egypt. However, he did not say how the material was used. Flint was employed in Egypt down to the Roman era. Professor NAVILLE said that iron belonging to the Old Empire was known, if rarely used, though the material was not generally employed prior to the Greek time. It has been supposed that the hard granites and porphyries introduced in ancient architecture and sculpture would have been useless if they were not for iron tools. But labour was cheap and iron implements of bronze or other materials would have served instead, although the execution by means of them was slow. It must be allowed that tools of copper are sometimes described by old writers as if there was little or no difference between them and those fashioned out of iron. Even ploughshares were made of bronze in Egypt, and the blades of the seemingly efficient weapons which we see in the wall-paintings were also of bronze. The earlier monarchs were treated like demi-gods, and their safety was of national importance. Yet they went into battle with no better protection than was afforded by leather or linen. We see none of them wearing armour. Stone hammers were long in use. The masons' and carpenters' mallets were of wood. But probably the oldest example of iron in the British Museum is a gimlet from Thebes with a wooden handle.

The Egyptologists at Leicester could not agree on any definite opinion concerning the earliest use of iron in Egypt. This is remarkable when we remember the elaborate and skilful investigations which are in progress. When, however, there is doubt on the subject of Egyptian iron, the opportunity is given for many other countries to set up a claim. It might readily be imagined that somewhere in India early examples would be found. The Iron Pillar at Kutub, which is over 23 feet in height, is unique; and it might easily be concluded that in a land where such a forging was possible ironworking must have been familiar from time immemorial. Yet it cannot be antecedent to A.D. 400 and therefore is not to be considered as a primitive example. Indian steel, according to Sir GEORGE BIRDWOOD, "has been celebrated from the earliest antiquity." But if judged by surviving examples, its antiquity is not far off. In the old sculptures trophies are seen bearing arms; but it does not follow that they differed from the warriors of Egypt and elsewhere whose weapons were made of bronze. It is concluded that as there was intercourse between India, Persia, Assyria and Greece, iron must have been used. The evidence is only of the traditional sort, and is not very convincing.

When we see such beautiful remains of armour as the shoulder plates known as the bronzes of Siris in the British Museum, and the great spears and swords which are represented in the battles of Amazons and other warlike scenes, it is allowable to infer that metalworking of all kinds was familiar in Greece from an early period. Yet at Mycenæ a few lumps of iron rings and a boss for a shield are enough to show how little was known about the manner of working it. According to Mr. ARTHUR EVANS, iron-founders' tools belonging to the close of the Mycenæan age have been found in Cyprus, and this would suggest the close of one period and the beginning of another. Familiar as we may be with iron it is evident that many obscurities surround the early history of its employment, and up to the present it is impossible to claim that all the efforts of advanced archæologists have succeeded in explaining when and where ironworking began.

When we come to Northern Europe we seem to be on firmer ground. The terms "Stone Age," "Bronze Age" and "Iron Age" were devised to express an evolution or development of Denmark as exemplified by weapons and ornamental objects. The Iron Age is calculated to have commenced soon after our era. The discovery at Hallstadt, in Austria, of a collection of weapons and instruments, some of bronze and some of iron, pointed to a period of transition. In the British Museum a Roman iron sword is to be seen in a bronze sheath. But in Denmark iron swords in iron sheaths were often found. We may therefore conclude that either the craft of sword cutlery had been improved in Rome or that for some other reason the northern armourers were able to surpass the Romans. The attention given to Roman ornament is in favour of the former theory. It is not, of course, to be supposed that every object found at Hallstadt was made of iron or bronze. Belonging to the Iron Age is much work in the precious metals. Nevertheless, iron was considered to form the best designation to suggest the change from the somewhat barbarous Stone Age to rudimentary civilisation. Weapons for offence and defence were indispensable, for civilisation is as much the result of war as of peace. Apparently the northern smiths had to be economical, and accordingly they sometimes were content to attach a steel edge to a blade of iron. Professor RIDGEWAY asserts that it is to Hallstadt we must look for the beginning of modern ironworking. Whatever may be the period to which the objects belong, there has been an almost continuous progression from those days to now. It is doubtful whether Hallstadt was a seat of manufacture, but the collection which was discovered in 1846 is so valuable it may be regarded as entitling the site to be respected as a place of culture which metal-workers should revere. The greater number of the objects are in the cabinet of coins and antiques of the Imperial Library, Vienna, and consist of arms, axes, trinkets, &c. At the present time salt-working is the principal industry of Hallstadt, and it is not easy to imagine how any others could have flourished there. But wherever they were produced originally, the relics discovered in the graves, which date from the third or fourth century, have had an astonishing influence on archaeology. To some extent they correspond with the Mycenaean discoveries in suggesting a point of meeting between two eras of human progress. From what we have said some excuse will easily be found for any indecision exhibited at the discussion before the British Association concerning the early use of iron.

To the majority of people the paper which was read by Mr. BENNETT H. BROUGH on "Iron Ore Supplies" will have more interest than any archaeological speculations, for the present and the future are of more concern to us than the past. In the early times iron was found by chance, now science is directing researches wherever there is a possibility of its existence. In many regions the prospects are hopeful, and according to Mr. BROUGH there need be "no immediate anxiety regarding the supply of the more pure iron ores, the application of which cannot fail rapidly to increase."

**The Hylton Castle Estate**, which stands on the north bank of the Wear, about two miles west of the boundary of Cumberland, comprising about 2,000 acres, has been sold to the Wearmouth Coal Company. The castle was built during the fifteenth century.

**The Restoration of Silk Willoughby Church**, Lincolnshire, proceeding, and many discoveries have been made. The aircase to the rood-loft has been opened, and a piscina and aumbry on the south side and an aumbry on the north side afford strong evidence that there were two side chapels in former days. In removing the plaster from the walls it came clear that the interior of the church was painted with frescoes—one especially on the north wall depicting, it is thought, St. George contending with the dragon.

## EARLY MOSAICS.

IT is so generally accepted that the Greeks practised in mosaic working as well as in painting, we may therefore assume they recognised a principle in the art which was worthy of attention. If masonry was of marble there was fitness in using other minerals to ornament it. We cannot imagine a Greek adorning a wooden structure with tesserae, supposing such a course was practicable. The statements which have come down to us concerning Byzantine methods are enough to suggest that, though in a condition of decadence, the original principle was recognised. We are told that the effect of tesserae, which were formed of transparent materials, was heightened by the introduction of thin metal plates. It is not very clear what cements could be employed which would not diminish such an effect. But the statement is enough to show that, if efforts were made to paint the lily and to gild refined gold, allied materials alone were used. Lovers of fresco maintain that mosaic was merely a mechanical imitation of painting. Yet even in the early days of Byzantium it was boasted that the representations of saints on the walls and vaults of churches did not resemble the older works, for the figures were dazzling in their brilliancy.

While this appears to be plausible, we must doubt whether mosaic commenced with the decoration of vertical surfaces. If marbles of several kinds were used for the walls of Greek temples, it might be said it was only a step from coloured masonry to coloured ornament. But it would be hard to persuade a modern artist or amateur that mosaic began otherwise than as a flooring. CÆSAR, it is recorded, although he knew the value of time in war, and the risks of superfluous *impedimenta*, insisted on having mosaics as a part of the furniture of his camp. Unfortunately it cannot be ascertained whether the mosaic served for a pavement or for pictures.

It is not difficult for us to understand the advantages which mosaic possessed for the adornment of Christian churches. Figures for which it was employed must have appeared to simple people to be arguments in favour not only of immortality, but of the communion of saints in heaven with worshippers on earth. During the lifetime of the oldest man there would be no perceptible change in the colours, and the traditions about their permanence could be transmitted from generation to generation. In that way we can explain the extensive use made of the art in Italy and the number of places where it was practised. The Byzantines resembled the Egyptians in believing in traditional proportions, a belief which is still perpetuated in the Russian ikons, and for such figures mosaic was well adapted. It also answered admirably for suggesting costly robes, and in early Christian art the nude was prohibited. The figure of St. SEBASTIAN during a long period seemed to be a subject which every Italian painter had to attempt. It was, in fact, only superseded by the discovery of the *Apollo Belvedere*. But when a Byzantine artist occasionally tried his hand on the figure of the martyr he was compelled to show him as clothed. The value of the material for expressing extraordinary richness is illustrated in the Pala d'Oro of St. Mark's.

When, after the lapse of some centuries, the Renaissance painters, who must have found it impossible to vie with Byzantine work, tried a development of the art by making pictures in marble, it cannot be said that art was the gainer. VASARI gives the credit to Duccio of Sienna—a painter of pictures on golden grounds. He was the first to commence, we are told, the decoration of the pavement of the cathedral of Sienna in "chiaroscuro." But the pavement pictures, although ingenious, have too many pictorial qualities for such a decoration. In course of time still more elaborate experiments were attempted, and eventually it was expected that the mosaicist would faithfully imitate every stroke of the brush which he found in the design prepared for him by a painter. When we learn that in

the pontifical mosaic factory of Rome it was necessary to provide 750,000 varieties of colour, *i.e.* 15,000 hues each having fifty tints, we can realise the burden which was imposed when mosaic ceased to be true to itself and set up in rivalry with the painter's art. The Renaissance artists no doubt looked on the efforts of the mosaicists as complimentary to themselves. But what was the use of such an elaborate expression of colour when the mosaics were to be seen in dimly-lighted vaults and positions which however imparted a weird interest to them?

Rio maintains there was an Early Roman school of mosaicists which produced works better adapted for church decoration than those by the Byzantines. The Greek artists, he said, dazzled the eye with gold grounds which often covered very large surfaces, on which appeared drawn, with more or less skill, the comparatively pale figure of the REDEEMER. The throne of God and that of the VIRGIN was covered by them with gilding; and as early as the tenth century this profusion of ornament in gold is already observable in their manuscripts and miniatures. In the mosaics of the Romano-Christian school the grounds are almost always white; or, if gold is sometimes employed, it is only to mark the luminous points in the clouds and draperies. If to this we join the singular predilection of the Greeks for long and meagre figures, and the common character which marks the heads of their saints, generally void of expression, we shall have recapitulated the most characteristic features of Byzantine art in the period in question.

So many critics have given the preference to Byzantine mosaics, it is well to find something said in favour of the Roman work. But we are less likely to see the latter in their pristine state than those by foreign artists. Rome was subject to invasions, to rebellions of the citizens and other dangers in which the churches suffered. It has also been stated that mosaics were altered, and the original countenances of saints removed in order that portraits of living patrons might be substituted. The churches must also have had a staff of workmen who followed no particular trade or art, but were willing to attempt all kinds of tasks. In that way the mechanical treatment which is sometimes to be observed can be explained. Byzantine artists or their descendants were not likely to be employed unless they had acquired a reputation for skill. They also accepted limitations for their art, and may have depended as much on recollection as on their inventive power. Consequently they preserved traditions for a much longer time than Roman and Italian workmen, although their figures lack the vigour which we see in those of the ZUCCATI in Venice with such a designer as TITIAN. The older examples have a quaintness which always must be considered attractive. Nevertheless it does not follow that for modern works Byzantine imitations are indispensable. Similar simplicity can be attained in other ways.

#### NEW BOOKS.

"The Law of Trade Unions," being a text-book concerning Trade Unions and Labour. By T. SETON JEVONS, B.A., of the Inner Temple and the Northern Circuit, Barrister-at-Law. (London: Effingham Wilson.

THIS little book opens with a few introductory remarks upon the history of the law regulating trade, the gradual rise of trade unionism and the recognition of the trade union. It then proceeds to consider the meaning of the term "trade union" and the legal position of trade unions under the Trade Union Act of 1871. A short account is given of the registration of a trade union and its effects; the amalgamation of one trade union with another; dissolution; membership; the rules as to the management of its property; the extent to which the Courts will interfere to protect the property of a trade union or to prevent mismanage-

ment; and its liability as defined by the Taff Vale case. The Act of 1871 is then set out, and the more important decisions upon its sections are noted. In particular decisions are noted upon the question as to how far the position of the trade union is affected by reason that some of its objects are illegal as being in restraint of trade, and upon the question of the relations of the members of the union to the union itself. Next follows the Act of 1876, the regulations under the Acts of 1871 and 1876, the Trade Disputes Act of 1906, the Trade Union Provident Funds Act 1893, and the Conciliation Act 1896. Some notes are given upon the view which the law takes of picketing, and the limitations with which it has been defined to be lawful by such cases as *LYONS v. WILKINS*. The provisions of the Conspiracy and Protection of Property Act 1875 as to a criminal conspiracy are explained, and the text of the Act is printed, together with some notes upon the principal decisions. The last Act dealt with is the Employers and Workmen Act 1875; the text is printed, and a few notes are given upon some of its sections. The appendix contains the official forms to be used under the Trade Union Acts.

The book thus gives us the Acts and Rules in handy form, and a guide to the leading cases. We are inclined to think that its usefulness would have been increased if the circumstances which had led to the passing of each Act had been shortly summarised before the Act was printed. Such a summary is a considerable assistance towards a due understanding of the sections of an Act, and more especially in a book meant for laymen as well as lawyers. Also it appears to us that the actual arrangement adopted makes the information conveyed a little scrappy. Thus the effect of the Conspiracy and Protection of Property Act 1875 upon the criminal law of conspiracy is explained on p. 76, and a reference is given to the Trades Disputes Act 1906. But we do not think that anyone but a lawyer could understand without a little explanation the difference between the civil and the criminal law of conspiracy, nor, consequently, the reason why the first section of the Act of 1906 was needed. We think that the author would be well advised to consider whether it would not be best to expand his general introduction so as to explain the gradual growth of the powers and privileges of trade unions, as illustrated by the chronological order of the legislation affecting them. We think that then the text of the Acts and the notes thereon would be better understood. We do not think that this need add to the length of the book, for some of the notes contained in the body of the work could be curtailed.

On the first page of the introduction we should like to see a small qualification made to the statement that against the local by-laws affecting trade in the thirteenth century, "an aggrieved member of the community dared not to appeal to the Common Law." It might be so in the generality of cases. But it does not follow that the legality of these by-laws was never considered. Disputes in the town between guild and guild, and guild and town sometimes led to a judicial consideration (see *e.g.* "Munimenta Gildhalli," *Rolle Series*, ii. 385); and the royal justices often questioned their legality (see *e.g.* "Gross Gild Merchant," ii. 82; Northumberland "Assize Rolls," *Surtrees*, 352-3). The later statutory control of the guilds was only another mode of exercising a supervision which had always been present. Parliament did what at an earlier period had been done to some extent by the royal justices.

Professor Hermann Ende, Crown Surveyor of Buildings in Berlin, and President of the Senate of Fine Arts, died on Saturday last at Wannsee in his seventy-ninth year. He was honorary corresponding member of the Royal Institute of British Architects since 1883. Among the buildings designed by him were the Imperial Palace, the House of Parliament and the Ministry of Justice in Tokio.

MAUSOLEUM IN CHIRK CHURCHYARD.

THIS structure has been erected by Lady TREVOR, of Brynkivalt, to the memory of her daughter, the Hon. MOYRA HILL TREVOR. The masonry is in DENNIS's Cefn stone, the roof is groined. Inside is a marble figure of an angel holding a child, which was sculptured in Rome. The architects are Messrs. EDMUND KIRBY & SONS, Cook Street, Liverpool. The masonrywork was carried out by CHATHAM BROS., of Cefn and Rhyl, whilst the woodwork was in the hands of TYSILIO JONES & SONS, Johnstown. The photograph is by MARTIN, Vron, Llangollen.

#### EXPLORATION OF CAERWENT.

IN the paper read before the British Association by Dr. T. Ashby on the Roman excavations at Caerwent, in Monmouthshire, he explained that Caerwent was divided in Roman times into twenty *insulae*, and was of rectangular form, now cut in the middle by the modern road which followed the line of the old Roman road from London through Silchester and Bath to Caerwent and beyond. A large block of buildings had been found. The Forum and Basilica constituted the central block of the north half of the city, and therefore on the sunny side. The first group of remains on the high road were conjecturally a monumental entrance. Then came a large open space, the Forum, with traces of shops on the east side. North of the open area was the Basilica, with a continuous line of steps probably connected with arcades. The south aisle of the Basilica was 13 feet wide and the north aisle the same, while the nave was 25 feet wide. The walls between the nave and the aisles were over 5 feet wide, and the columns were nearly 3 feet in diameter. The remains of these columns were enough to allow of the reconstruction of part of the Corinthian capitals of the columns, which were extremely like those of Silchester. At the east end of the nave was a large room, approached by broad steps and heated by a hypocaust; this was very possibly the senate house or council chamber. At the north of the Basilica was a range of

large rooms, probably used for municipal purposes. The block of the Forum and Basilica was surrounded on three sides by streets. The whole of the Basilica was traversed below the floor level by a large covered sewer that carried the drainage from the open area. The building had been very much devastated, and no traces had been found of statues or inscriptions that must have been there and very few traces of superstructure; though the massive foundations of the walls, largely tiled, were well preserved. The sandstone slabs that formed the top of the walls on which the columns stood and the top flight of stairs had been taken away. A complete private house had now been wholly excavated. Apparently this had been twice reconstructed, and the periods could be traced with some little difficulty. This type of house found at Caerwent was apparently unique in England, for there were rooms round all the four sides and courtyard, and the south side was not open as usual. It was very interesting to notice how far the ancient boundaries were followed by the modern ones, with only slight variations due to the encroachments of successive proprietors. In future excavations the hope was to find more houses, and to make further investigations in connection with the early earth mound that preceded the stone wall. All the four gates in the stone wall were still in existence, and parts of the stone wall itself were preserved to the original height of 20 feet.

## EASTERN INFLUENCE ON WESTERN ART.\*

ORIENTAL costumes and details prove contact between the East and the West, but Oriental influence was felt at a very early period. In France especially it can be recognised before the Christian era, Egyptian and Egypto-Greek objects finding their way by the usual trade routes even as far as the Low Countries, probably from Alexandria. After the arrival of the Goths Syrian influence becomes more evident. The museum at Arles proves an active centre there for sarcophagi copied from Roman works, but by its side another was formed in close relation with Ravenna and the East. Examples both at Arles and Toulouse prove their co-existence till the end of the sixth century. Numerous Syrians were in France from the earliest times of the empire, and the first Gallo-Roman churches were probably founded by Oriental emigrants, a mixed population among whom Jews and Greeks with the Syrians were in the majority. The "Vita Hilarii" mentions Jews at Worms, Cologne, Metz and Poitiers, and there were many at Arles. Other MSS. prove that the Syrians were everywhere, and possessed of a good deal of power. Gregory of Tours shows them to us very rich and possessing objects of art. Inscriptions show the early presence of Greeks at Lyons, Bézançon, Trèves, Vienne, Narbonne and Arles, and councils also prove their presence in Gaul. Relics of Oriental saints were brought westward in reliquaries which gave the suggestion of such ornament as appears at St. Jean, Poitiers. As for the Syrians, in the sixth century the most active of the Christian races, St. Jerome says that in his time they were everywhere, and that trade was in their hands. Many of them were of the labouring classes: they were gardeners, and through their means the West gained several of its fruit trees; were artisans, mosaicists and sculptors; they exported industrial objects, such as glass, silk, leather, &c. Contemporary authors show these Syrians to us in all the maritime towns. At Orleans they formed a powerful colony, and at Paris one of them named Eusebius, in 591, bought the Episcopate by profuse presents, and soon gave to his countrymen the administration of the bishopric. It was by means of the Syrian colonies that the ideas and legends of the East were spread in the Middle Ages, and M. Courajod used to say that it was impossible to exaggerate their importance in the development of design. The biography of St. Columba, by Jonas, monk of Bobbio, shows an affinity of doctrine, of sympathies and beliefs, between the Syrians and the Irish and Anglo-Saxons, which is evident also in their art.

The principal French towns for the exchange of the merchandise of the Levant and Constantinople were Marseilles, Narbonne and Arles, as in Roman times. The maritime towns of Provence and Languedoc had in the twelfth century, both in the kingdom of Jerusalem and at Constantinople, commercial establishments and mooring places on the quays. Provençals had a church and a quarter at St. Jean d'Acre, while the Narbonnais traded specially with Egypt. The principal Italian commercial towns also had their quarters similarly. Among the ivories imported from Alexandria are the six which decorate the side panels of the pulpit at Aachen, given by Henry II. Dr. Strzygowski has proved that these have the characteristics of the Coptic form of Syro-Greek art; and the chair of Maximian, at Ravenna, an earlier and finer example of ivory carving, has also a very decided Syrian character, though whether it was carved at Antioch, as he thinks, or in Alexandria or Constantinople, appears doubtful. The textiles with hunting scenes in medallions, or beasts, birds, or monsters face to face, of which fragments remain here and there in Western Europe, as at Aachen, Chinon, Toulouse, Sens, Le Mans and Durham, as well as in museums, are either Byzantine copies of motifs of Sassanian origin or Sassanian originals, and an example has been discovered in Japan quite plainly based upon these patterns, which shows that their influence spread eastwards as well as westwards. The patterns carved on Eastern ivory caskets or oliphants, in which relics were sometimes brought to Western Europe, with a similar motif, also had their effect, such as the Soltikoff horn, a work of the eleventh century, which, if not carved in the East, was copied from an Oriental ivory, the similar horns in the museums of Toulouse and Le Puy, &c. In these ivories the suggestion of Romanesque subject and pattern is unmistakable.

The pillars of St. Saba, in the Piazzetta, Venice, were

brought from St. Jean d'Acre, as the sequel to disputes with the Genoese, they having formed the gate to the castle opposite the church of St. Saba. The patterns upon the sides are very characteristic, vine leaves and bunches of grapes issuing from a vase and controlled to a strict conventionalism in their growth and the spaces which they fill. Upon the upper edge of the pier is a fret with slanting sides, a peculiarity which is found in Celtic interwoven patterns. In this sarcophagus from San Lorenzo, Milan, you may see absolutely the same conventions in the central panel, and they occur also at Ravenna, Ancona and elsewhere upon the slabs of ambos and chancel enclosures. The archivolt of the Foscherari Monument, in the Piazza St. Domenico, Bologna, made of a portion of an eighth or ninth century ciborium, and much resembling the baptistry at Cividale, has a running pattern derived from Syria, which frequently occurs, with a varying number of leaflets, supporting the ball in the centre. At Castel St. Elia, near Nepi, is a slab with this Syrian pattern having five leaflets. It occurs at Ravenna, in fragments in the museum, and may be seen as a pierced ornament on the bronze horse-trappings from the tomb of a Gaulish warrior in the British Museum. The ivory covers of a book in the Treasury at Monza have on one of them a pattern in which the leaf forms are more defined, two filling the circle, as on the tomb of Theodora at Pavia, with a creature within, whilst the other has a beautiful pierced repeating pattern, recalling carvings of the ninth century at Comio, Milan and Rome. In the Treasury there is also a comb of ivory, ornamented with filigree and jewels. A comb of a similar shape but without the enrichments was found in 1771 on Barham Down, near Canterbury. The one at Monza is said to have belonged to the Lombard Queen Theodelinda. In the Museum at Cairo is a fragment of ivory carving in which the vine appears springing from a vase in true Byzantine fashion with birds about the branches, which Dr. Strzygowski considers to be Syrian. The arrangement of this is a good deal like the outside of the Ormside cup, of which I shall show you a drawing in connection with the Anglian crosses. Leaves of somewhat the same kind occur on the panel carved so well in the tenth century by Tutilo at St. Gall, in which he closely imitated the character of the older Italian work, to which he added the subjects of the Assumption of the Virgin and the legend of St. Gall; and an ivory in the cathedral of Tournai has leaves and stems arranged in much the same manner. A sarcophagus found in the cemetery of St. Saturnin, Bordeaux, dating from the sixth century, shows something of the same treatment, though rather freer in the underlying lines; and no doubt in all these cases a traditional mode of filling a panel with vine leaves and fruit was followed. A version of this treatment of the leaf may be seen in another piece of sixth-century work, a capital in the Cathedral Parenzo, imported from Constantinople. Mr. Butler says that in the Haurân the grape vine is the most common motif in the pre-Roman and Classic carvings, and that in Christian carvings of the North of Syria it is almost the only motif used, but with a tendency to a severe conventionalism; and that if animal forms were introduced they were subjected to an equally severe symmetrical conventional arrangement.

Recent researches by Dr. Strzygowski also seem to prove a direct influence of Syrian art upon the West. In an early Evangelist which he studied at Etchmiadzin, in Armenia, he found some Syrian miniatures of the sixth century inserted, which he holds to prove that it was customary to export miniatures from Syria. Charlemagne, shortly before his death, had a recension of the Gospel made, with the help of both Greeks and Syrians. This may explain the curious pavilions in the Godescalc and Soissons MSS., which are unlike any Western architecture but much resemble one of the Syrian miniatures, as well as the arcading beneath which the Eusebian canons are set, which are equally similar, and of which the sixth-century Syrian MS. of Rabula shows another example, with horse shoe arches. The resemblances between the school of Egbert of Trèves and Syro-Egyptian art may be traced back to the same source or may be the result of importation from Alexandria.

The fine ivory in the Louvre, showing Constantine and the hero of the faith, or Justinian, which Dr. Strzygowski believes to be Alexandrian, like the reliefs on the ambos at Aachen, belonged to a Rhenish church in the middle of the seventh century, probably to Trèves Cathedral. On its back it has 350 names of believers, arranged in six columns, many of which belong to the Rhine and the diocese, names of archbishops between the fourth and the seventh centuries.

\* From the Cantor Lectures by Mr. F. Hamilton Jackson, R.B.A., vice-president of the Society of Decorative Designers, published in the *Journal of the Society of Arts*.

and of others sprung from Trèves. At the end of the fifth column names of kings of Austrasia occur, from the second half of the sixth to the middle of the seventh century—Heldebert, Theudebert, Theuderic, Clothair, Sygisbert, Childebert, Athanagild, Fachileuva, Inganda. At Wolfsheim, near Mainz, in 1869 or 1870, a jewel was found which had probably formed part of a girdle. It was encrusted with jacinths and garnets, or red glass, and had upon it the name Artaxerxes in Pehlevi, the form of the letters making it probable that the first of that name was the person referred to. The discovery was of great interest as showing that the particular form of decoration of jewellery was practised in Persia in the third century, and also that there was direct communication between that country and Germany during the early Middle Ages.

In England we know the Romanesque as the Norman style, and the architectural ornament has not in general the variety and fancy which characterise the continental Romanesque. Bishop Stubbs says the Norman brought little in comparison with what he destroyed, and little that he brought was his own. Late examples are sometimes florid, as the fine door at Kilpeck, Herefordshire, the prior's door at Ely, and the door at Barfreston, near Canterbury. Decoration was generally focussed round the doorway, which frequently had four or five recessed orders, with shafts and carved members between. Examples may be seen at Lincoln, where the house of Aaron, the Jew, has the door beneath the projection of fireplace and chimney on the first floor; also a fine doorway may be seen in the cathedral; at Ilfley, Durham, Malmesbury, St. Peter's, Northampton, Kenilworth, the College Gateway, Bristol, St. Margaret's-at-Cliffe and many other churches; and other ornamental features at Romsey, Tewkesbury, Glastonbury, Exeter, Norwich, Worcester, Gloucester, Castle Rising, Rochester, St. Cross, Winchester, the Galilee at Durham, &c. Prior Ernulf used interlacing arcades as a wall decoration on the outside of the cathedral, Canterbury, about 1110, and repeated them at Rochester a few years later, when he became bishop. Here also the mutilated figures of Henry I. and Queen Maud or Edith show that the portals of Chartres and St. Denis had their influence in the south of England, but for the most part the figure sculpture is barbarous, though the monsters and animals show a quaint fancy, and the ornament is confined to the repetition of a few forms, of which the chequer, the billet, the zigzag, single or double, and an allied form like heraldic engrailing, the nailhead, chip carving patterns, the besant, beak-heads and interlaced arches occur most frequently. The patterns from Behioh and Safa, in Syria, show that some of these forms occur in sixth-century Syrian work, and scrolls like those of the church at Behioh, with winged cherubs of an Oriental type occur on the shrine of St. Mummolus at St. Benoît-sur-Loire (678-85). Capitals are sometimes scalloped or gadrooned when on circular piers, and a kind of cushion cap like a ball with slices cut off perpendicularly is common; these frequently had ornament painted on them. The carved caps often suggest initials of MSS. with animal forms, the interlacings treated flatly with scales and pearlins. On smaller objects, however, we often find beautiful and elaborate work. Examples of chessmen in the British Museum and at Oxford in the Ashmolean show considerable vigour of conception and carefully arranged ornament, as on the backs and sides of the chairs in the chessmen in the British Museum. Here, too, is a very fine example of an eleventh-century Tau cross of ivory belonging to a bishop's crozier, which is both finer in design and workmanship than the one in the Musée Cluny, found in the tomb of Abbot Morard at St. Germain des Prés and dating from the same period. An earlier one is in the museum at Rouen which came from the abbey at Fécamp. The drawings will show that the date of ninth or tenth century which has been suggested for this work is too early.

Some of the twenty-five lead fonts scattered up and down the country, most of them in the south, are Norman in design, as are a good many of those worked in stone, of which two very fine examples in Norfolk may be mentioned, at Toftrees and Shernborne, but those which are perhaps most typically Romanesque in appearance, such as those at Lincoln and Winchester cathedrals, which, as well as that at St. Nicholas, Brighton, are decorated with subjects from the life of St. Nicholas on some of the faces, and with roundels containing birds and monsters on the others, and made of black marble, were imported from Tournai ready carved and are not English at all. There are seven in England, six in France, and three in Belgium itself. There are sepulchral slabs of the same material and workmanship

at Bridlington and Ely. A very fine font, carved with different patterns on each of the four sides and signed by the sculptor Robert of Durham, still exists at Bridekirk.

At Durham the sanctuary-ring still hangs from the door, though the monster has lost his eyes of crystal. It is so much like a door-ring at Le Puy that it has been ascribed to the same smith, which seems improbable. The MSS. do not show any great advance upon those executed before the Conquest either in ornament or in figurework. The zigzag is a very ancient pattern, the earliest instances of its occurrence being prehistoric. It is found on vases from the tombs of Cnossos, on archaic pottery from Camiros, and on an Etruscan ossuary from Vetulonia of the second or third century B.C. On a piece of prehistoric pottery found in a tomb with a flint arrowhead, impressions of the arrowhead were so arranged as to produce a zigzag, tempting one to suggest this origin for the ornament. Its earliest use as architectural ornament is, I believe, on the modillions above a door at Spalato. Other of the characteristic ornaments have an Eastern derivation, such as the rosettes and besants, others from ease of production, as the nailhead and dentil, while the beakheads are probably Scandinavian, though they have a barbaric appearance which reminds one of Polynesia and New Zealand. In Sicily the Norman influence in ornament shows very little. At Cefalù there is an interlaced chevroned arcading on the façade. At Girgenti the door of the ruined church of St. Giorgio and the great window of the fourteenth-century campanile (both with pointed arches) have the familiar zigzag, and at Bivona the same details occur, while the door of Santo Carcere, Catania, which belonged to the ancient cathedral, has round arches with columns in the recessed jambs and some carving of the twelfth century. Mr. Phenè Spiers has informed me that two doors of one of the Cairene mosques bear decoration of Sicilian origin, one having the Norman zigzag and the other the cushion voussoir, which appears to be a Sicilian invention, though it is found in the church of the Holy Sepulchre, built by the Crusaders after the taking of Jerusalem in 1100. The usage of cushion voussoirs was carried back to France, and they occur in the abbey church of Evron (1150-75), the central window of the apse of Marolles-en-Brie, the doors of the churches of Chivy and St. Pierre at Soissons, of Bellegarde, Plassac and Marignac, in the chapel of St. Gilles at Pons, and the tower of La Croix, Aisne. The strangest use of the zigzag with which I am acquainted is on two caps in St. Mark's, Venice, which are surrounded with the ornament on a large scale with a very odd effect, and the occurrence of two precisely similar in the mosque at Kairouan suggests that they are importations from the East.

In Scandinavia an exceedingly elaborate ornamentation was developed at a rather late date, based upon the Romanesque intertwining scrolls, which was applied principally to the decoration of the doors of churches, as in the instance from Hallingdal, although also applied in a modified form to furniture and to caskets. The caskets are sometimes of bone and sometimes of wood; the rest of the work is executed in wood, often enriched with colour. Heathen symbols and incidents occur mixed with Christian, but it is pretty well established that most of the work is as late as the thirteenth century, though the Norsemen became Christians in the eleventh. From the ninth century onward they habitually robbed Western lands, and carried costly objects home with them. It appears therefore that these patterns are imitations or developments from Irish jewellery, &c., though some influence from the Continent is possible. Discoveries of Oriental coins in the North prove that exchange between Scandinavia and the East began after the fall of the Sassanian power, but relations became closer in the ninth and tenth centuries, to which periods thousands of Cufic coins which have been found belong.

**The Glasgow Corporation Committee** on the Glasgow Building Regulations Act, 1900, having taken into consideration the terms of Section 102 (5), which provide that after the expiry of seven years from the passing of the Act the provision that all window-sashes in dwelling-houses and in habitable rooms above the ground floor shall, except where there are sufficient outside railed balconies or platforms, be so constructed as to admit of the outside of the window being cleaned from the inside of the room shall apply to existing dwelling-houses, recommend, in respect of that period having elapsed on 30th ult., that it be remitted to the Master of Works to have the provision carried out.

## NOTES AND COMMENTS.

It is believed that the old Romans could command the services of itinerant artists who were able to decorate the walls of their houses at a cheap rate. Some fragments of the kind of work which served can be seen in the Naples Museum. In our time printed papers have taken the place of painters' work, and although stencilling and textiles are sometimes substituted paper is likely to be adopted for many years to come. In the volume on wall decoration by Mr. A. S. JENNINGS (Trade Papers Publishing Company) reproductions are given of a large variety of papers by Messrs. JEFFREY & Co., CHARLES KNOWLES & Co., Wall-Papers Manufacturers, Ltd., and others, which will suggest the success attained in this country. Many of them are printed in colours. The book may therefore be taken as representative of advanced production, and the critic must be difficult to please who is not satisfied with such abundance of fine designs. The pages will be found interesting not only by those who are in quest of wall-papers, but by all who have an interest in the extension of applied art.

THE annual report for 1906-7 of the Bristol libraries committee has unusual interest, for it records the opening of the new Central Libraries on College Green, designed by Mr. PERCY ADAMS. The building also serves for an exhibition of early books, bindings, illustrations, &c. The success of the Central Library is evident from the statement that 62,263 volumes were issued from the lending department during nine months. During the year 750,672 books were lent from the committee's libraries, and out of that large number only four were lost, of which three were stolen. The new Central Libraries have been visited by representatives of various local public bodies as well as others from outside the city, including a deputation from the public library authority of Hamburg (Hamburgische Gesellschaft), the latter authority having expressed themselves highly gratified with the arrangements, especially in regard to the administrative methods.

MORE than any other class that can be named, more even than writers, since man may elect not to read while he must see, architects, says the *American Architect*, have the opportunity to excite pleasure in or inflict disgust on their fellow-men through the exercise of their creative faculties, and if architects gave more heed to this fact, possibly the architectural aspects of our cities and countryside might benefit. Conscientious and progressive architects, in their later years, must look with a good deal of regret at the enduring expression of their youthful efforts, but we fancy that when the late WILLIAM H. RUSSELL, who died abroad, reviewed the work he had accomplished, he found pleasure in perceiving that so much of it was of a nature to give more pleasure than pain to his fellow-citizens. In their class the buildings designed in late years by the firm of CLINTON & RUSSELL—the Hotel Astor, the Seventy-First Regiment Armoury, the immense Hudson Terminal building, the Atlantic Mutual building and the great apartment-house on upper Broadway—are among the notable buildings of New York City, competently designed, although not exactly manifesting genius on the part of the designer, and admirably planned and built. Mr. RUSSELL, who was born in 1856 and was a graduate of Columbia College, received his early architectural training in the office of his great-uncle, the late JAMES RENWICK, eventually becoming a partner in the firm of RENWICK, ASPINWALL & RUSSELL. In 1894 he was taken into partnership by Mr. CHARLES W. CLINTON, who for many years had enjoyed the friendship and confidence of an important group of owners of

real estate in the commercial districts of the city. From that time forward his career was clear, though it demanded the mental and physical effort that often wears out too soon the man of artistic temperament.

UNITED KINGDOM PROVIDENT INSTITUTION, STRAND, W.C.

HEREDOS IN CHAPEL, CONVENT OF ST. MARGARET, EAST GRINSTEAD.

CLOCK TOWER, ST. GEORGE'S CIRCUS, S.E.

THE donors of the above tower are Mr. WILLIAM FAULKNER and Mr. FREDERICK FAULKNER, of Blackfriars Road, S.E. In an open competition, instituted in May 1905, Mr. JAN F. GROLL's design, from among 126 competitors, was awarded the first premium. He was appointed architect and carried out the work. The style of the clock tower is Classic, with a dome in Hindoo Saracenic, the prevailing style in British India, where Mr. GROLL has been in practice as architect. Depth of foundation is 18 feet, height of tower from pavement to top of stone finial is 70 feet, material to main body is Portland stone known as "Whitbed," base of tower to a height of 10 feet is in Cornish grey granite from the quarries of Messrs. W. HOSKEN & Co., LTD., Penryn (near Falmouth), Cornwall. On each side of the tower above the cornice of the granite base an escutcheon carved in Portland stone respectively carries the armorial bearings of the Borough of Southwark, the City of London, the Bridge House Estates and St. GEORGE. There is an iron staircase inside leading to the clock chamber, balcony and belfry. The clock, by Messrs. GILLET & JOHNSTON, of Croydon, with four clock faces each of 3 feet 6 inches diameter, illuminated by electric light from the inside, and provided with a set of five bells, strikes the hours, half-hours and quarter-hours, and chimes the Westminster chimes. An "Excello" arc electric lamp of 4,500 candle-power, supplied by the Union Electric Co., Ltd., of Park Street, Southwark, suspended to an artistically wrought-iron bracket guarded by the St. George's winged dragon, is on each side of the four corners of the tower at a height of 30 feet, throwing its powerful rays far into the six main roads converging on the Circus. On the east, south and west side of the granite tower base bronze memorial tablets are fixed, of which one sets forth the deed of gift, the names of the donors and the architect; the other the names of the mayor, town clerk, borough engineer, builders, sculptor and clockmakers; and the third the removal of the Obelisk, &c. The bronze and ironwork are by the Birmingham firm of Messrs. HARDMAN, POWELL & Co., the same who supplied the artistical ironwork to the Houses of Parliament. The artistically executed carvingwork is by Mr. G. S. ARROWSMITH, the sculptor, while the builders are Messrs. WILLIAM KING & SON, of London. The total cost of the clock tower is about 3,500*l*.

BANGOR FREE LIBRARY: SECOND PREMIATED DESIGN.

ADDITIONS, NORTH SUTTON, SEAFORD, SUSSEX.

THE interesting "Old Farm House," of timber and tile construction, has long since disappeared in the evolution of a later development of brick and slate. The alterations now contemplated being intended to bring the house more "up to date," and to impart as much sunlight into the rooms on the south and eastern fronts as it is possible to get. Our illustration is from a water-colour sketch by the architect, Mr. PHILIP TREE F.R.I.B.A.

CATHEDRAL SE<sup>1</sup>ES.—SOUTHWARK; THE LADY CHAPEL.

# LANGLEY MARISH.\*

LANGLEY as a place name is not uncommon in England. King's Langley and Abbots Langley are places whose distinctive titles possess obvious meanings, having been respectively royal and monastic possessions. In the case of Langley Marish, or Marsh, the distinctive name is not so obvious, and three different meanings have been allotted to it.

First, that the parish lies in a marsh, which is not the case now, if it were so in the bygone past. It is true that the country is flat here, and the great canal is close by. Secondly, it is suggested that Marish is a variation upon Maries, the church being dedicated in honour of St. Mary. And, thirdly, it is stated by Lipscomb that the manor was held by Christiana de Mariscis for a short period only in the reign of Edward I., from which it is suggested with the greater show of reason that de Mariscis was the family name, giving the village and the parish its name. The family, later called Marreys, resided at Ockwells, near Maidenhead, and their historic home, which was ravaged by fire in 1778, is described by Mary Russell Mitford in her "Recollections." Its character may be inferred from that lady's description of it as "a curious and beautiful specimen of domestic architecture in the days before the Tudors."

The parish originally formed part of Wyrardisbury, or Wyraysbury, and its church was a chapel of ease to that parish, so that in Domesday it was not surveyed separately. At the time of the Survey it was the property of Robert Gernon, and in the "Testa de Nevill" is said to have belonged to Richard Monfichet as parcel of his barony of Stansted in Essex. This Richard was the eldest son of Robert Gernon, and took the name of Monfichet. The manor passed out of the hands of this family to Edward I., by reason of the minority of Ralph Plaiz, the cousin and heir of Aveline Mountfichet, notwithstanding a claim to the state put in by Elizabeth, Countess of Oxford, as being heir to Ralph. It was retained by the Crown till 1447, when it was granted to Eton College; then again it passed to the Crown by exchange, for in 1492 Henry VII. granted the manors of Langley Mareys and Wyrardisbury to Elizabeth, the queen consort, as appears by the Patent Rolls, 7 Henry VII. The eighth Henry had a finger in the Langley pie, as a matter of course. When about to marry his deceased brother's wife, Catharine of Aragon,

Edward VI. gave the reversion of the manor to Thomas Hennage and William Willoughby, and also granted it in 1551, as part of the Honour of Windsor, to his sister, the Princess Elizabeth, and the park there with the bucks and does therein. Then the said Princess Elizabeth, when she became queen, in the year 1585, in consideration of services done by Sir James Crofte, knight, and at his request, granted to Edward Wymarke, gentleman, 6 acres of land, 2 acres of wood and other lands and hereditaments in Langley Marish and Iver, called the Rayles, the Middle Close, the Galewick Marsh, Galewick Wood and the Little Close.

ST. MARY, LANGLEY MARISH.

In the reign of Charles I. came the turn of the Kederminsters, the family which has left the most lasting name on the church and manor. The manor was granted in 1626 to Sir John Kederminster, knight, and Dame Mary, his wife, and their daughter and heiress, Elizabeth, carried the estate in marriage to Sir John Parsons, knight, of Boveney. Sir William Parsons, created a baronet in 1661, succeeded, and on his death his executors sold the manor to Henry Seymour, Esq., of the family of the Duke of Somerset. This was in 1669, and Seymour died in 1686, and was buried here. His only son, Henry, was created a baronet when seven years old, while his father was still living. Henry Seymour died, unmarried, in 1714, and the estate passed to Sir Edward Seymour, Bart. The latter was grandson of Edward, brother to Henry Seymour, the first purchaser. Another Sir Edward Seymour, Bart., conveyed the estate to Lord Masham in 1714, who sold it in turn to the Duke of Marlborough in 1738. The latter conveyed it by deed, dated September 30, 1788, to Sir Robert Bateson Harvey, Bart., in whose family it still remains.

Such is the varied and far from uninteresting roll of the owners of the manor of Langley Marish, for which we cannot be too grateful to Dr. Lipscomb. That valuable chronicler of Buckinghamshire history tells us, of the home of these notable men, that "the manor-house was originally built by Sir John Kederminster, Bart., but soon after the Duke of Marlborough came into possession it was pulled down and a new mansion built. It is a large square stone edifice with little exterior decoration, situated in a park beautifully wooded, rendered more celebrated by the taste and elegance with which the grounds were laid out by his son George, Marquis of Blandford, who resided there during several years, and commenced that beautiful specimen of ornamental gardening which his Grace subsequently carried out to so great a degree of perfection in the noble demesnes at Blenheim."

The church of St. Mary, Langley, was built by the Kederminster family, according to Lipscomb, but much of the structure is anterior to 1626, the date of the grant of the manor to Sir John Kederminster. There is a stone carved with a star pattern in the Norman style built into a wall at the east end of the nave arcade, and a plain Early English arch may be seen on the north side of the west end of the nave. In the fourteenth century the present chancel and north chapel were rebuilt, and the north aisle somewhat later. The windows of the chancel and north aisle retain their Decorated tracery. A later addition was the Perpendicular window on the south wall of the nave (there does not appear to have been a south aisle); this window

ALMSHOUSES, LANGLEY MARISH.

conveyed to her, when Princess of Wales, in full satisfaction of dowry, &c., *inter alia*, the manor of Langley Mareys. The deed was dated June 10, 1510, and the manor was held by Catharine when queen. The deed was attested by William, Archbishop of Canterbury; Richard, Bishop of Winchester, Keeper of the Privy Seal; John, Earl of Oxford, Great Chamberlain; Thomas, Earl of Surrey; George, Earl of Salop; Sir Charles Somerset, knight; Lord Herbert; and Sir Thomas Lovell, knight, Treasurer of the King's Household. Again Henry VIII. dealt with the manor, granting it in 1523 to Henry Norres, knight, of the Body, with the appurtenances and all rights of fisheries, for his lifetime, together with the office of keeper of the King's Woods in the County, Plaunte or Park of Langley Maresse.

\* Read at a meeting of the Upper Norwood Athenæum on July 6, by Mr. Theophilus Pitt, F.C.S.

has been blocked up. In the seventeenth century the work of Sir John Kederminster begins. He took down the arcade separating the nave from the north aisle, and replaced it by wooden pillars, putting the date 1630 upon the architrave. Then, on the south side of the church a chapel was built to contain the monuments of the Kederminsters; this was also used as a family pew. It is raised many steps above the level of the church, and surmounts a vault. At this time also the upper portion of the tower was rebuilt in brick, and also the library, which is the special feature of the church. Sir John Kederminster left it "as well for the perpetual benefit of the vicar and curate of the parish of Langley, as for all other preachers and ministers of God's word that would resort thither to make use of the books therein." John Milton is said to have made use of the library, which is not improbable, considering his connection with the neighbourhood. The chief distinction between this parvise and others of a similar type lies in the fact that the room in this case was built for the library. Usually the parvise over the south porch of a church was built for the convenience of the clergy, and was mostly attained by a winding staircase opening into the church. Those who would like to acquire further information with regard to the Langley library may consult "The Care of Books," by W. J. Willis Clark, 1901, and a paper by Charles Knight in *Once a Week* for July 1859. In 1792 a screen made of "Coad's artificial stone" was erected to separate the manor pew from the church. In modern times there has been no "restoration," and to this fact is due, no doubt, that some interesting details are left to us. The sedilia and piscina of Early English date, some old encaustic tiles in the chancel, fragments of fourteenth-century glass in the north aisle, and a shield with the Stuart arms encircled with the Garter are intact. The ancient roofs remain, and the decoration of the chancel roof in gold and colour is left. The Perpendicular chancel screen is of oak, and the Jacobean pulpit bears the arms of Kederminster, with the date 1625. The brass candelabrum was placed in the church in 1709. Of the monuments, the chief is one to John Kederminster, d. 1556, and his wife Elizabeth, d. 1590, with two sons and three daughters; and Edmund Kederminster, d. 1607, and his wife Anne, d. 1618, with two sons and six daughters.

Langley Park is the seat of Sir Robert Grenville Harvey, Bart. The mansion was built by Charles, Duke of Marlborough, and contains a full-length portrait of Mrs. Siddons by Sir Joshua Reynolds, Lady Hamilton by Romney, and many other valuable pictures.

### ARCHITECTURAL CRITICISM: SIR R. SMIRKE.

IN the first half of the nineteenth century the criticism of buildings by architects then living was allowed to be expressed with more severity than afterwards. One of the reasons was no doubt the monopolising of important works by a few men. Having official appointments, they were supposed to possess exceptional ability by clients of an ordinary class. An architect who could testify to the change in criticism was Sir Robert Smirke. He died in 1867, but he was fortunate in obtaining commissions almost in the beginning of the century. He was a pupil of Sir John Soane, and made the usual tour through Greece and Italy. In 1831, when the following criticism was written, his tide of prosperity was at its height, and there was some courage required, as well as much knowledge, to explain the shortcomings of the works he had executed:—

Were we called upon briefly to sum up our opinion of the professional talents of the architect of King's College we should describe him in the words of Pope, as one who is "Content to dwell in decencies for ever." Mr. Smirke never indulges in vagaries of any kind, for he never steps out of the beaten track. His style is not a little insipid, yet perfectly decorous and well-bred. Notwithstanding which, although he never shocks us by any very glaring improprieties of commission, he generally contrives to disappoint us by those of omission. As far as it goes, his system is a safe and secure one; but then it goes a remarkably little way, hardly ever exceeding the limits of mediocrity, and stopping short of the confines of genius. He seems rather to be content with the negative merit of merely not offending, than ambitious of the higher praise of delighting us by eliciting new beauties and displaying original powers. He never sinks below, but neither does he ever rise above, the ordinary level. His porticoes are classical, his columns are classical;

still they are classical merely by routine, being just what any one else could produce with the assistance of St. "Athens." They are correct because they are facsimiles; their correctness therefore is not the result of study rather it is of that species which is attainable without study at all beyond that of mechanical imitation. The accuracy he exhibits is precisely the same as what would be shown by a Chinese workman were he set to copy a Grecian column with an original before him. It happens, oddly enough, too, that although he always affects an ultra-classical in his designs, he rarely infuses into any of the spirit of the antique; nay, seems so little to understand it that he not infrequently mars and disfigures them by blemishes which, although apparently of minor importance in themselves, impart a vulgar taint to the whole. Clever as a copyist, as an imitator he is for the most part both unskilful and unfortunate, for as soon as authorities desert him and he is thrown upon his own resources, he betrays such a sterility of imagination, such a deficiency of taste, and so much feebleness and insipidity that we almost question whether he really feels the beauty of the style he professes to follow. As to originality, hardly anything like a virgin idea can be pointed out in any of the numerous works he has executed.

The new Post Office, which, by-the-by, has been set up as a wonderfully fine piece of architecture, will not found to contradict our criticism. That it is a very fine building, in a style immeasurably superior to that of almost every one of the most lauded productions of the last century is indisputable; and that we ourselves can view it with sufficient satisfaction, although not with unqualified approbation, we as readily concede. Still we cannot help suspecting that we must attribute the improved taste which exhibits quite as much to the age as to the artist. Even a lad who had passed only two or three years in an architectural office could not fail to produce something many degrees better in point of design to what we find was able to command distinction upon its author about a century ago. At least he could not well commit such egregious solecisms or indulge in such offensive puerilities. Not having seen any of the projects sent in by the other competitors, we cannot judge how far Mr. Smirke's merited the preference it obtained; but we must say, when we look around us, we do not think he has at all advanced beyond the average ability of contemporaries.

In estimating an architect's talents people seldom enter into the account how much he has either been favoured or impeded by external circumstances, making no allowance in the latter case, while in the other they gratuitously impute to superior skill and talent what is chiefly attributable to propitious opportunity. Thus many a man has obtained considerable reputation, if not altogether perdurable fame, merely because he has been employed upon great works. We are much of the opinion of Molière's miser, when he tells his cook that anyone could make a handsome dinner with a plenty of good things, that the great art consists in making a splendid banquet of almost nothing. While, therefore, we are far from denying that the Post Office possesses much dignity, we also think that it would have required a more than ordinary degree of perverse ingenuity to have rendered a façade of such extent and constructed of such material, otherwise than imposing and possessing some pretension to grandeur. Unchecked and counteracted by extreme littleness of manner, mere quantity can hardly fail to produce, *ceteris paribus*, a striking effect than is attainable upon a smaller scale. A species of merit, therefore, depends far more upon the accident than talent; and we will venture to affirm that there never yet was, and to predict that there never will be, an architect who would erect a small building if he were at liberty to erect a large one.

The question then becomes this:—Has Mr. Smirke exhibited here any of those finer qualities of art which evince superior taste and intelligence? Is there anything in the general composition that indicates a master mind? any bold conception, any original idea, any peculiar feeling of expression, any particular beauty of detail, or anything that the architect has stamped as exclusively his own? There be it is more than we have yet been so fortunate to discover. Where he has quoted the ancients (architects we cannot help observing, frequently do little more than quote, and sometimes with little propriety, too), Mr. Smirke does as well as anyone else, and anyone else would do equally well as Mr. Smirke, but when he ceases to quote and gives us Mr. Smirke we instantly become sensible of the difference.

Where, we ask, was his classical taste—his perception the *to kalon* and the *to prepon*—when he could either sign for a Grecian Ionic hall those miserable windows fitly for a kitchen or a stable and those three insignificant, d-looking arched doorways with the clumsy gallery above them, or could think of putting up Ionic columns in a vestibule of that description? At least, why did he not attempt to preserve some degree of keeping and accommodate the building more to his own architecture—if he could not render the latter more of a piece with the order—by leaving the columns unfluted? We beg pardon for such a question; Mr. Smirke would not be guilty of anything so unclassical in the world. Where, too, we must again ask, was either his invention or his taste, when he made the design for the building in front of the building, in which it is impossible to trace the least similarity of character with anything else?

If we seem to be trying Mr. Smirke by a rather severe test, it at least proves that we consider his works worthy of a critical examination; and also because such defects do us far more than they would if the whole were more uniformly mediocre, when such inconsistencies would be so striking and less offensive. Nay, we will admit that far more violations of propriety are to be met with in the works of his predecessors, and that if he chooses to be measured by such a standard, he will undoubtedly not appear to disadvantage. Yet it would be but a poor compliment to an architect of the nineteenth century to say that he has steered clear of the vices and barbarisms of more or less disfigure nearly every building of every architect from Inigo Jones to James Payne inclusive. This would be rather too much like commending a poet of the present day for not being so dull as Sir Richard Blackmore, affecting to admire a face-painter as being at least equal to Jervis or Hudson. By lowering our standard in this way it is not difficult to make anything appear great; compared with the "Castle of Otranto" the production of almost the meanest imitator of the Waverley school will seem a masterpiece; by the side of Hoole any tolerable versifier may pass as a poet.

Now Heaven forbid that we should set up such an insulting defence for Mr. Smirke as to say that, compared with the Swans and the Lewises, the Taylors and the Pynes, the Carters and the Carrs of the last century, he is only Grecian where it pleases him to be Greek and Gothic where it pleases him to be Gothic; that if sometimes quite frigid and tame, he is infinitely more pure if not more imaginative—never so *bathetic*. Praise of such description would, in our estimation, be infinitely worse than a hundred spoons—"very tolerable," as the worthy Dogberry says, "yet not to be endured." Mr. Smirke seems to have got his architecture "by heart," or rather by rote; to have furnished himself with a goodly assortment of ideas, not exactly new, indeed, but as "good as new," of which he seems to be solicitous to make the most by ekeing them out in the thriftiest manner. To such an extent does he exercise his caution that it would really be difficult to point out three or four bona-fide original ideas in all that he has done, which is saying a good deal, since he has had as many opportunities as any one of the present generation of architects.

If, considered as a work of art and not merely as so many columns and windows and so many square feet of face, the Post Office must be content with our acquiescence rather than our approbation, the terms in which we have ourselves compelled to speak of some of Mr. Smirke's other works will not bring down upon us the accusation of severity. In the church in Wyndham Place he seems to have lost himself entirely. It is bald even to meanness in meeting-house with a steeple; and that steeple, moreover, is as uncouth in every respect as could well have been devised. It would be downright libelling even Mr. Nash's design in Langham Place to compare it with the structure in Wyndham Place. Belgrave Chapel is infinitely better, because there he has ventured upon nothing more daring than a plain tetrastyle portico of the Ilyssus Ionic, and the building is in good keeping and free from offensive anomalies. A very different character is the structure containing the London Club House and College of Physicians, than which it would not be easy to point out a more huddled-up composition, or a more disagreeable kind of antithesis than that afforded by the classical columns and the exceedingly unsuitable aspect of the other features, and the manner in which they are put together. All that we can prevail upon ourselves to add by way of qualifying the opinion we have expressed is that it must be understood with reference to

the east side of the building, and also with reference to the improved architectural style of the present day; otherwise it would be exceedingly easy to point out far greater offenders.

Mr. Smirke's *rifacimento* of the front of the Custom House may be appreciated at a glance. He has, we confess, so far rendered it all of a piece, that the centre is now of no more importance than the wings. Mr. Laing's design was certainly a very so-so affair upon the whole; still it did possess some propriety of character and some degree of balance and contrast. These Mr. S. has "poked out" altogether; consequently the building has not been at all improved by the "reform" to which it has been subjected; on the contrary, it is now as insipid and flat a pile of stone and mortar as can be imagined.

As yet it would be premature to speak of what Mr. Smirke has done at the British Museum. It was asserted some time back in the House of Commons that when completed the whole pile will form one of the most splendid pieces of architecture of modern times. The value of the opinion must of course depend altogether upon the judgment on which it is founded. We can only say that, as far as we are guided by present appearances, we are not particularly sanguine in our expectations. The exterior of the wings towards the court presents but a cold and sullen aspect, and, if we may trust those who have seen the designs, the façade will be rather tame and commonplace. Perhaps, however, the honourable critic in Parliament spoke rather with allusion to the interior of the structure, where we admit that Mr. Smirke has greatly surpassed himself in the Library in the east wing. On this we can bestow unqualified approbation, which we do most cheerfully. Here there is no drawback upon our admiration, the whole being as much distinguished by the uniform elegance that reigns throughout, as by the beauty of its materials and its imposing extent. Whatever the architect, too, may opine of the general tone of our criticism and our censorial strictures, he will hardly undervalue our praise or suspect us of adulation.

Without extending this examination of his other works we shall now speak of his latest work, King's College, Strand, which ought to have been noticed long before. We, however, have preferred marshalling our paragraphs more according to the etiquette observed in a royal procession, where the post of honour is not in the van. We must not be understood as intimating by this that King's College deserves this kingly situation by its intrinsic merit. With regard to the elevation of the college itself, if there is nothing in it to warrant particular animadversion, there is likewise nothing to excite our approbation beyond the pitch of calm complacency. We greatly question the propriety of deviating from the plain and unadorned yet not displeasing style of the opposite range of building; or we should rather say we think it would have been better had that model been adhered to, as by that means uniformity and economy would have gone hand in hand. At present, the consistency that would have atoned for embellishment is quite destroyed, although it is hardly possible for anyone to divest himself of the idea that the structures opposite, and thus opposed to each other, essentially form a portion of one extensive whole. We think, too, that even if it were desirable to give a more ornate character to the new building, it would have been as judicious to have adhered to Sir William Chambers's model in the elevations towards the court, upon which Mr. Smirke has certainly not improved. He is less Italian than his predecessor, without being a whit more Grecian, and has deviated materially from him both in his basement and his order, without substituting anything better. Everyone who compares either the back-front of the part towards the Strand or the opposite end of the court with Mr. Smirke's design must be sensible of this, for while the detail is far less picturesque, the general aspect is of an inferior stamp. It is certainly neat and pretty enough, but it is altogether destitute either of nobleness of manner or gusto. Compared with the order, the architraves of the windows look bald and feeble; and we may here observe, too, that Mr. Smirke also invariably employs the same design for his windows, be the order he introduces, or the general character he aims at, what it may; as to character, indeed, his style exhibits but a very limited compass. In the order the plain modillions of the cornice do not harmonise particularly well with fluted shafts; as little do we approve of projecting and retiring divisions being introduced into this façade, as it tends still more to destroy that degree of balance and general correspondence of outline, if not of

detail, which the eye naturally looks for in a vista of this nature. We will nevertheless own that we may be somewhat hypercritical here, since the architect may plead that this was done expressly in order to prevent that degree of uniformity between the opposite ranges of building, which would have rendered their discrepancy in other respects more displeasing, and he may further say they are as independent of each other as buildings facing each other in the same street. Be this as it may, we regret that he did not employ material of the same hue and texture as that used in the ornamental parts of Sir William's building. If Portland stone was considered too expensive, it then becomes a question whether it would not have been better to have carried the principle of economy still further, making the exterior of the college similar to the opposite building and to have expended all that would have been thus saved in forming a more noble approach from the Strand, and rendering that, if not an extensive, at least an imposing piece of architecture, a character to which the present entrance has no pretension whatever.

Were it not for the arms of the college—which stand like the columns of the open loggias on the terrace, above a mere arch, and consequently threaten to fall upon the heads of those who venture beneath it—were it not, we say, for the arms, this homely gateway might be mistaken for one leading to some mews, or to a porter-brewery. Still, however dissatisfied we may be with it in itself, we are satisfied that it will be found to confirm some of our remarks, being an evident proof that Mr. Smirke either does not possess, or does not care to employ, the talent of effecting much with apparently little means. The frontage towards the street is certainly narrow, not quite equal to that of the Post Office; nay, a few feet more would not have been amiss; still, even as it is, there was a fine opportunity to produce a noble propylæum, of strikingly original and picturesque design; something, in short, stamped with an air of sublimity, and rearing its lofty crest with majesty. But, most unfortunately, Mr. Smirke has too much of that disposition which, although so amiable in ethics, is so fatal in art, ever to indulge in ambitious aspirations. He is perfectly content to adopt the very first idea that presents itself, be that idea ever so homely or hackneyed. He has accordingly given us here what we have seen over and over again, a stale and vapid design; exempt, it must be confessed, from any notable vice, yet equally exempt from any particular beauty. It is just the kind of design a mere builder would have furnished, and had we been told that Mr. Cubitt was the author of it we might have deemed it a sufficiently respectable affair.

No one, we will venture to say, not even the architect of the New Palace, flings away opportunities at the rate Mr. Smirke does. Here, for instance, was one—we could name many others—of which an architect of any genius would have eagerly availed himself, to have erected not only a noble exterior façade, but also a fine and varied scenic perspective from the street, which might have been effected in many different ways, all more or less highly novel and striking, but all neglected. Wherefore, too, is this gateway, such as it is, made to form a gap between the houses, since there seems to be as little meaning and motive in it as there was occasion for so doing? In some cases a break of this kind is made to conduce to effect; here it is attended with none that we can discover, except it be a disagreeable one, appearing to arise more from mere accident than purpose. In fact, this circumstance even tends to render the entrance still more insignificant by giving it the appearance of being squeezed in between the houses. Perhaps, however, we may be mistaken after all; and certainly its coy retiring modesty is commendable, arising, as without doubt it does, from the consciousness that it loses nothing in our esteem by not being more conspicuously placed. Or it may be that the gateway is thrown back in order to give the opportunity of railing it off by a barrier which is still uglier than the palisading in front of the Post Office, such as a common carpenter would design, absolutely mean and uncouth both in its general appearance and detail, and in a style infinitely inferior to what we now perceive aimed at even in ordinary shop fronts.

The Trustees of the Cowper Museum, Olney, are about to appeal to lovers of the poet for funds to enable certain necessary alterations and improvements to be carried out. In particular, it is intended to throw open the entire house where the poet resided for many years, and to show the room in which he wrote "John Gilpin."

## A LIVERPOOL ARCHÆOLOGICAL EXPEDITION.

ONE fine day the Vice-Chancellor of the University of Birmingham, recuperating in the healing air of an Egyptian desert, was strolling about and reflecting, how different it all was from the familiar English scene; how far off and faint the sights and sounds of the ordinary routine life seemed, when he came upon a great plume which made him rub his eyes. On it he found inscribed "University of Liverpool Institute of Archæology." Being inquiring into the causes of this phenomenon he discovered members of the staff of the Institute busy about the excavations, and spent an interesting afternoon with them. His respect for the enterprise of his Liverpool neighbour is said to have been much increased by this experience.

A traveller in the remote parts of Asia Minor last summer might have had, says the *Liverpool Courier*, a sensation similar to that of the Vice-Chancellor by stumbling on the camp of a small band of adventurers from the centre and on the same quest—the extension of archaeological knowledge. Under the captaincy of Professor Garstang, the Rev. M. Linton Smith, Herr Horst Schliephack and Dr. Arthur Wilkin, starting from Constantinople and travelling by train to the rail head at Angora, set forth from that place on an expedition of inquiry into the archaeological possibilities of that portion of Asia Minor which is held to have been covered by the ancient Hittite Empire. For its dimensions this group of explorers was well equipped on many sides. Professor Garstang, with his wide experience of archæological work both in England and Egypt, has the skill in the methods and practice of the science and the knowledge of the problems which are so vital and pressing in that field of work requisite in the leader of such an enterprise. The Rev. M. Linton Smith is an expert in Greek antiquities, of which it was certain that a number would be found in a region where the Greeks (the Romans after them) are known to have been. Dr. Arthur Wilkin, in addition to his archæological interests, is a physician, and his presence was a valuable insurance against possible physical miseries which, in those wild parts far away from medical aid, would have otherwise entailed. Happily the members of the expedition enjoyed excellent health throughout their travels. Herr Schliephack is a skilled photographer, and the harvest of over four hundred photographs which have been gathered and brought home will be of the greatest value for the record of this journey.

The expedition, it should be explained, was of the nature of a "prospecting" tour. There were reasons which we need not go, for believing this part of the journey into Asia Minor to be particularly rich in archæological material, the object was to take a first survey of the whole field in order to test this conviction, and, if it were verified, to mark out the spots where later and more detailed investigation would probably be most fruitful. In the result the expectations of Professor Garstang were more than realised. They have come back greatly impressed with the wealth of material there and with the magnitude of the importance of the civilisation indicated by it. It is believed that there will be found "documents" which will afford material assistance in investigating the problems of Babylonian, Assyrian and Egyptian history. What may be brought to light from the ruins of the Hittite Empire will, it is thought, when fitted into its place, make clear a number of historical puzzles insoluble at present for want of missing pieces. The country again is in the track of some of the great historical movements of peoples and armies from the East to the West and from the West to the East. The memorials of these migratory representatives of the various civilisations which passed this way are to be expected. The expedition found many signs of both Greek and Roman handiwork in their travels.

The first destination was Boghazkeni, the ancient capital of the Hittite Empire in 2000-1000 B.C. The expedition found excavations in progress there, and were fortunate in obtaining a complete and striking series of photographs of the ruins of the temple, the ancient city walls, and the fortifications. Among these photographs are to be specially marked those of the sculptures known as "Jasily Kaya." These represent the groups of figures in relief as in a remarkably fresh state of preservation. The significance of these sculptures is not yet quite made out. The most probable suggestion is that they represent a Hittite religious festival. But as illustrations of Hittite art, and as a consequence indications of the maturity of this civilisation, they are of great interest. Euyuk, notable for its sphinxes, was also

visited. Two new sphinxes were discovered by the party. The photographs of the Euyuk sphinxes are among the most impressive in the whole series, and will create a good deal of interest when they are published. The expedition then passed on to Cæsarea, and in its neighbourhood were fortunate in finding a number of Hittite inscriptions and antiquities. In this district on the banks of the Halys river a particularly good find was made. This was the (headless) figure of an eagle standing on three lions. The figure is a massive piece of work many times the bulk of a man and reveals much strength and boldness of design.

Passing by Bor and Killisse Hissar to the Cilician Gates, Professor Garstang and his friends spent some time in the Taurus mountains examining Hittite remains and racial types. Through the noble and splendid scenery of this part of the journey the party descended to Cilicia. Thence they pushed on to the north of Syria. Here a solid piece of work was done in the exploration and mapping out of the valley of the Afrin, a river which flows into the Orontes at Antioch. This wild and desolate region has been very little known hitherto. In this great silent waste it was impressive to come in several places upon the remains of old Greek cities. At one spot—Huru Pegamber—photographs were taken of a remarkable instance of such a city, with theatres, columns and public buildings. The fireside stay-at-home peruser of these photographs can partake in part of the thrill which this spectacle of a city in the wilderness must have given to the discoverers. In this same lonely valley of the Afrin, near the head of the river, the exploring party examined several Hittite sites, and had the fortune to find numerous sculptures and inscriptions, of which, of course, a record has been made.

This work done, the members of the expedition had completed their business for the season and had to think of home. Tracks were made for Aleppo, which was reached in safety; thence to Beyrout by train, and so on to England again. Professor Garstang, after a few days' delay in London in connection with the business of the exhibition of Egyptian antiquities, the fruit of his last season's excavations at Abydos, reached Liverpool a few days ago. He expresses himself as more than satisfied with the results of this pioneer journey, which, by the way, was in all about 5,000 miles in length. He is persuaded that in the region from which he has just come there is an archaeological mine which will yield considerable treasure, and which, therefore, calls for the serious attention of archaeologists. The journey was made possible by the courtesy of the officials at Constantinople, and agreeable by the local Turkish officers, who were almost invariably kind and helpful. There was some puzzlement in the Turkish mind at finding a German travelling in the company of Englishmen. The view that science has no boundaries had not travelled thus far. But no serious difficulty was caused. The conjunction was in the end, no doubt, regarded as part of the general "madness" of the party. The good offices of Quilliam Bey were of much value to the expedition.

special reference to the profession of architecture, and further to encourage investigation in connection with all branches and departments of knowledge connected with the profession.

Such an ambitious undertaking is certainly worthy of all commendation, and if the formation of the Institute will make for the improvement of the architectural profession in Canada it should undoubtedly be given every possible encouragement.

In the present condition of the country it must be apparent to everyone that the small country town practitioner is afforded very little opportunity of rubbing elbows with his fellows, or even of realising that they and he have interests in common to the extent of interchanging professional ideas. Will the formation of the Institute better this condition? The membership is intended to comprise architects practising over the entire Dominion—a vast territory. With such wide jurisdiction and scattered membership, it is questionable whether it will ever be possible for the Institute to aid materially in the betterment of the profession without the aid of local chapters, acting in a capacity subordinate to it. While doubtless one great central organisation, such as the Institute promises to be, would serve as a means of maintaining the status of those within the pale legally and professionally, its activity might end there, and what is avowedly the main purpose of the Institute, viz. the interchange of professional knowledge, as quoted above, would be entirely overlooked. In the larger cities there are already chapters or associations which ought to work hand in hand with the central organisation, if a complete network of influences is to make for the good of the profession.

The State recognition which the Institute seeks aims at improving the status of those who happen to be within its pale. The part the Canadian architect may be expected to play in the future history of Canada will be no inconsiderable one, and it is undoubtedly an opportune time for him to assume something of the position he merits in the public estimation. It is possible by a proper scheme of registration to materially benefit the profession in its practical as well as in its higher aspects. No one has a better reason for seeking every legitimate protection from the "charlatan" than the man who, by earnest study and much labour, has proved himself fully qualified to pursue the practice of his profession.

A considerable difficulty arises here, however, by reason of the proposal to limit the word "architect" to members of the Institute only. That the test of an entrance examination should be the means of determining membership is a feature of the new organisation that will receive considerable opposition from a large part of the profession. While there is no doubt that anything looking to the better educational preparation of young men entering the architectural profession is highly desirable, it seems scarcely wise to so suddenly institute an innovation in the present procedure, and limit the title "architect" solely to those who have succeeded in passing an examination of the character proposed by the Institute. Good architects are to-day enjoying the confidence of their fellow-men, and have risen high in the profession without having passed any examination whatever.

In any profession it is the standard of practice that is the vital question, and it is doubtful if this can be raised by an entrance examination, hastily prepared for and extremely limited in its scope. The fact of his architect having passed such an examination weighs but little with a client, neither does it guarantee for that architect any greater ability to provide for the public safety. On this particular stress has been laid by some exponents of registration in the United States, not, however, to the welfare of the cause. The opponents of registration point scornfully at the unsavoury history attaching to the Pennsylvania Capitol at Harrisburg, and contend that if, as so many claim, one of the strong reasons for registration is to insure the safety of the public against incompetent architects making mistakes, the sooner that claim is dismissed the better. They contend that if the Government is to be urged to license architects, it should also hold a moral and commercial inquest.

However, it must be admitted that there should be a better opportunity afforded students of architecture for preparation at our universities. It is to be regretted that in Canada the existing opportunities for academic training along architectural lines are shockingly inadequate. In Toronto University a "tacked-on" course at the School of Practical Science is all that Ontario can offer. McGill, of

## INSTITUTE OF ARCHITECTS OF CANADA.

FOLLOWING the agitation that for so long has been maintained by the architectural profession in Great Britain and the United States, says the *Canadian Architect*, the question of registration, the time has apparently arrived when Canadian architects are about to take definite steps in the matter of forming what is to be known as "The Institute of Architects of Canada." So much has been written in English and American architectural journals regarding the vexed question of registering architects that scarcely anything new can be said upon the subject that has not hitherto been directly or indirectly referred to. Statistics have been brought forward to prove that in some States of the Union, where there has been put into practice some such system of registration as is now being contemplated in this country, the beneficial results accruing therefrom have been considerable. On the other hand, just as strong testimony has been adduced to show that in places where the registration system has been given a fair trial no good results have been obtained.

Referring to the outline of the project of incorporation of the proposed Institute, with which doubtless most of the profession are by this time familiar, we note that the "Institute of Architects of Canada" has as its object to facilitate the acquirement and interchange of professional knowledge among its members, and more particularly to promote the acquisition of that species of knowledge which has

course, offers better facilities. However, if the new Institute will endeavour to secure in Canadian universities more complete and satisfactory courses of study than now exist it will be doing a commendable work. Greater culture for the architect, to be obtained by a good university training, in the humanities as well as in science, will be an infinitely more satisfactory object of attainment than the hasty preparation in the rudiments of heating and ventilating a building that would be the general result of "cramming" for the entrance examination, as outlined in the act of incorporation, for which examination the average student would of necessity prepare himself by private study.

With its many desirable features, the act of incorporation as it now stands will bear some modification. In any case, it is unlikely that it will escape criticism at the hands of at least some members of the profession before it is finally accepted *in toto*. In the main, however, Canadian architects appear prepared to co-operate in any action that looks to the betterment of the profession.

#### ADAM BEDE'S COUNTRY.

THE members of the North Staffordshire Field Club held their fourth excursion of the season on the 27th ult., when, to the number of about ninety, they visited the "Adam Bede" country, including Norbury, Ellastone (where the earlier scenes of George Eliot's novel are laid), and Wootton. At Norbury, says the *Staffordshire Advertiser*, the old manor-house was first inspected, by the kindness of Captain H. A. Clowes. The hall was occupied by the Fitzherberts of Norbury until about 1649, when the estate passed into the hands of the Fitzherberts of Swynerton. The rooms contain some fine oak panelling, and one is traditionally known as Sir Anthony's study. The manor-house was rebuilt in the fourteenth century by Nicholas Fitzherbert, and there is an archway leading from it to the church. This ancient edifice was next visited, and its numerous interesting features were pointed out by the rector (the Rev. A. G. Metcalfe), who first drew attention to the tomb of Sir Henry Fitzherbert, dating back to about 1300. The monument consists of a recumbent effigy in stone with chain armour. The chancel was built in the fourteenth century, when one of the Kniveton was at Norbury. The attention of the club was drawn to the fine heraldic glass in the chancel windows, which is said to be amongst the finest in the country. The east window was sold to a Roman Catholic church in Yorkshire, and for some time the aperture was boarded up, but in 1847 this gave way to the insertion of glass from different parts of the church, the finest portion of the present window being a representation of the Trinity. In the chancel are situated the tombs of Nicholas Fitzherbert, which dates back to 1473, and Ralph, his son. Nicholas had eight sons and five daughters by his first wife, and two sons and two daughters by his second, and figures representing the family of seventeen occupy arched compartments around the tomb. The Rev. A. G. Metcalfe said that it was the opinion of Dr. Cox that the two tombs were executed about the same time. In the centre of the chancel floor is the monumental brass of Sir Anthony Fitzherbert, who was a noted judge in his time. The brass was intact until 1847, when some portions of it were removed and not reinstated, the rector remarking that it was known that some of the pieces were used as playthings by a former incumbent's children. The brass is of great antiquity, for on the reverse side there are indications of its having been used before the death of Sir Anthony. It was explained that the tower of the church was built in the fifteenth century and its position (between the two chapels on the south side) was possibly accounted for by the existence of the archway from the manor-house to the church. The edifice was dedicated to St. Barloke, as was proved by the wills of two of the Fitzherberts, who directed that their bodies should be interred "in the church of St. Barloke at Norbury," but nothing was known of that saint and the church was now called St. Mary's. At the conclusion of the inspection of the church a hearty vote of thanks was passed to the Rev. A. G. Metcalfe.

A pleasant walk across the fields brought the party to Calwich Abbey, to which they had been invited by Mr. A. C. Duncombe and Lady Florence Duncombe. At the entrance to the grounds they were cordially welcomed by Mr. Duncombe, who conducted them round the beautiful gardens, where they were subsequently joined by Lady Florence

Duncombe. The members were at once interested in exceedingly delightful surroundings, and the various points explained by their distinguished host and hostess were followed with much appreciation. It was mentioned that the abbey was built about sixty years ago and that Han was a frequent visitor at Calwich. After partaking refreshments, the club were invited to view the interior of the mansion, a privilege which was highly appreciated, and much admiration was shown for the exquisite panel and needlework executed by Lady Florence Duncombe. Before leaving, the Rev. C. F. L. Barnwell thanked Mr. Duncombe and Lady Florence for their great kindness in entertaining the club. Mr. Duncombe said that he and his wife had been delighted to see the members, and hoped that it would be the last occasion on which Calwich Abbey would be visited by them.

After another pleasant ramble through the fields the stone Church was reached, and there the Rev. F. J. Wrottesley, vicar of Denstone, explained the features of interest in the absence of the Rev. E. H. Birley. Mr. Wrottesley said that the edifice had undergone two restorations. On a doorway on the south side of the chancel was the date 1588, and he thought this portion of the masonry had been taken from another part of the building and placed in its present position, with the Langton arms. Looking at the church at the east end, Mr. Wrottesley thought that the north aisle was of later date than the south aisle, and that it was a copy of the latter, the date of this being probably about 1480, while the tower was no doubt erected in 1470. The interior of the church was then visited and the great width of the nave arches was pointed out. The monument of one of the Fleetwoods, who came from Lancashire, was inspected, the guide explaining that the tomb was in memory of John Fleetwood and Joan, his wife, a daughter of Thomas Langton, baron. John Fleetwood died in 1590, and although he directed that his remains should be buried at Ellastone Church, the interment took place elsewhere. The features of the tomb and the arms having been explained, Mr. Wrottesley said the church registers commenced as far back as 1538.

A vote of thanks was accorded the conductor, on the proposition of Mr. A. Scrivener, of Hanley, who remarked that his theory as to the great width of the present arch was that there had been at one time four arches instead of two.

The interior of "Adam Bede's" cottage was then visited, and the rooms which remain of the old house where Robert Evans lived were pointed out. Dr. and Mrs. Covey were heartily thanked for their kindness in throwing open their residence. Wootton Lodge was next visited, the excursionists being welcomed by Colonel and Mrs. Heywood. It was explained that this building was fortified by the Royalist troops under Sir Richard Fleetwood in 1643, but surrendered to a large force of Parliamentarian troops. Sir Richard and his retainers were captured, but he was liberated shortly afterwards, the reason for which was probably to be found in the fact that his brother-in-law married Cromwell's daughter. The position occupied by Cromwell's battery was pointed out, and it was not thought that he had ordnance large enough to knock down the massive walls of the house from such a distance.

#### INFLUENCE IN ARCHITECTURE.

THAT architects should endeavour, above all things, to give character to their compositions, as being one of the chief and most speaking excellences in design, was the advice of Sir John Soane. Character, as a term in architecture, must be distinguished from style, for there may be many characters in the same style; and also from expression, for there may be many expressions contributing to the same character. By style is understood a particular description of order; but character alludes to the specific manner in which such style may be applied. Expression, which details only are spoken of, is synonymous with character, but, as every member conveys a distinct expression, it is left for their combination in an entire erection to decide and confirm its character. Although character is, in fact, simple, though forcible, language of the features in architecture, it is notwithstanding the most abstract, and, it may be said, even the most immaterial attribute that strikes upon the mind. It is immaterial, because it derives its realisation all its essentials from the effects produced by collected objects relatively, and not so much with regard to the objects themselves. To exemplify these positions

assertions more clearly, and touching the progressive influence which they respectively have on our feelings, it will be found that, on the view of an edifice, we recognise its style, we perceive its expressions, but we are impressed with its character. Hence it becomes, as it were, the conducting medium between the intrinsic beauties and qualities of the art and the pleasures and feelings they excite. If space or vastness improve its commanding character the response is wonder; if delicacy or minuteness invite examination, it is met by concern and curiosity; if variety vaunts worth its merits, it is respected for richness and value; and if uniqueness, too humble almost to claim its due, tenderly renders its cheerful tribute to harmony. The vividness of these impressions may be more or less biased by preconceived ideas, or prescience of the purposes of an erection with which the character should have some affinity; but as this may, and probably will, be different with each individual, the cause rests entirely with him, and does not concern any effect of the architecture.

The influences which act upon character from without—that is, by means entirely foreign to itself—are considered to be two, viz. locality and aspect. Locality, which includes every distinction of region and climate, it will be easy to prove, has as many distinct powers over the operations of character in building. The pyramids of Egypt, the temples of India, the mosques of Turkey and the cottages of Switzerland all partake of their several localities, and of the notions that might naturally be suggested by their respective climates and scenery. Locality, however, within our own land is equally subservient to our subject. Let us suppose ourselves placed before a prospect of a great eminence with a building on its summit, having for its details turrets, battlemented walls and pointed apertures; the character suggested by such a locality would be that of a castle; and, to show that it is the scene only that so influences the character, we will imagine that in the valley beneath there is an erection having a similar combination of parts; but there, at once, they are altogether changed in our imagination, and the same expressions that in the one case formed the striking idea of a castle in the succeeding instance assume only the characteristics of a village church. It is only with places of pilgrimage that difficulty of access is recognised; ordinary churches are expected to be approachable by young and old worshippers. The mere circumstance of an approach to a building being altered as to its level will sometimes make a very sudden and great difference in the effects which its character had previously produced.

There is not any very perceptible difference in the actual construction of buildings in this country which may be attributed to their being exposed to any particular severity of weather on certain aspects. The influence, then, that character in architecture receives from this cause may be reduced to the single circumstance of the power of the sun, as it varies shadow and, to a certain extent, colour. A northern aspect, with the sun during the greater part of the day behind it, is not only enveloped in shade itself, but casts a shadow on all before it, which is a kind of type of the gloom that is generally felt to be its characteristic impression. A southern aspect, consequently, obtains the greatest duration of the sun's rays on it; and is the most influential, by the depth and perspicacity which it gives to the details, and (contrary to the northern aspect) it receives additional clearness from the reflection of the ground before it. The eastern and western aspects are, of course, neither so long nor so powerfully under this influence of the sun. As the habits of society in general have introduced rather an artificial change in what may be called daytime, they have not much opportunity of judging of the effects of the sun when in the east, and it already begins to retire from that aspect by the time they are leaving their houses. Therefore, as we are speaking of effects worked upon their minds, the eastern aspect has not so great a share of their favour as the western, because when the sun is in the west, and even setting, it is, with the fashionable world, comparatively midday. In porticoes especially, where the force and depth of the shadows are most important and desirable, their character is much deteriorated by being subjected to a negative influence as either the northern or eastern aspects receive. A comparison between the north and south elevations of a church or other building, being constructed exactly similar, will better show the difference of character caused by aspect than any other illustration. The most successful method that has been adopted of remedying this detrimental effect of aspect seems rather to consist in the use of internal recesses from the line of a

building, in preference to extraneous projections, which often fail in procuring the desired effect. Perhaps the north front of Somerset House may have received this consideration, as to a great extent it may be applied to this principle.

Having thus pursued the subject in the view of its influence upon the mind and also the influence it receives, the third point of view in which it presents itself concerns its composition, or in what it consists. Perhaps the fact of its having been represented, in the first place, as an immaterial subject, may make it appear rather paradoxical to descend at once to the consideration of its reality. It is immaterial from the expanse of its description and its indefinite nature, yet, like character in the human disposition, it is only such by its maintenance, and the construction that aids that maintenance forms the reality from which it is extracted as an essence. Character in architecture then is, in brief, originated and upheld by the consistency of combined expressions. In the design of an erection the data of some previously executed model are often taken for adoption to a greater or less extent; but to have also a claim to originality there must be sufficient variation to avoid its being a copy, and yet sufficient similitude in such variation to preserve its character. A too close adherence implies servility, and, again, too great a freedom with any given basis is at the risk of its injury. It is the confusion of having one datum in an original model, another in the present purpose of the building, and a third in the architect's invention, that is so likely to occasion a mingling of the whole together, and probably the destruction of all character in the architecture. This has been much complained of in the modern addition of a steeple to the primitive and ancient form of a temple, as in St. Martin's, St. Pancras, and other London churches where (independently of the alleged defect in construction, which consists in placing the steeple over the pediment) it produces an equally important defect, by the injury which it does to the character of the architecture, by the union or rather confusion of two very opposite expressions. Simply, the appropriation of a particular order is the most usual and prevalent course; and this, while it leaves scope for originality in its adaptation, limits the data to those which are available with the greatest facility as precedents. Hence increased novelty of form, produced from the same materials, becomes the main cause of distinction in character, and in the aptness of these changes, and in the suitableness of these variations, lies the great art of producing this effect.

Of course, novelty, for its own sake alone, can be achieved with a much freer hand by breaking forth from all precedent whatever; but the preceding remark is made with reference to architecture of an orthodox kind (if such a term may be used), and not to any occasional eccentricity. Indeed, the architecture which is least known, and which is most remarkable for its singularity, is the furthest from what could be desired in character, the perfection of which is comprised in its producing the same unequivocal admiration from the greatest possible number of minds. Instead of which, there can scarcely be two similar opinions of any building, the only deducible proofs of the worth of which, the absence of all comparison, are wrapped up in the conceit of the inventor.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE last of the series of four lectures at the architectural exhibition in the rooms of the Royal Scottish Academy was given by Mr. Ramsay Traquair. The subject was "The Church of Sta Sophia and the Imperial Mosques of Constantinople." The church was described by Mr. Traquair, as were also the mosques, which, the lecturer said, were built by the Turks after the Turkish Conquest on the model of Sta Sophia. Mr. Traquair went on to describe the rise of the Byzantine style and its culmination in Sta Sophia, and thereafter he showed on the screen some examples of the Persian tiles used to decorate the buildings. An excellent series of views of buildings in Constantinople concluded the lecture, for which Mr. Traquair was cordially thanked by Mr. Hippolyte J. Blanc, who occupied the chair.

Sir Thomas Gibson Carmichael, in supporting Mr. Blanc, said he could only hope with regard to some of the buildings recently erected in Edinburgh that they were more charming inside than outside. To Mr. Blanc he moved a

vote of thanks for the splendid manner in which he had organised the exhibition.

Mr. Blanc, in acknowledging the vote of thanks, referred to the excellent way in which the secretaries and the committee had carried through the work connected with it. The advantages of such an exhibition to the citizens of Edinburgh could not, he said, be measured in pounds, shillings and pence.

#### NATIONAL PORTRAIT GALLERY.

THE following donations to the National Portrait Gallery have recently been received and accepted by the Trustees:—

John Frederick Lewis, R.A., 1805-76, the well-known painter, a sketch in oils by Sir William Boxall, presented in accordance with the instructions of the late Mrs. J. F. Lewis.

Rev. Sydney Smith, 1771-1845, Canon of St. Paul's Cathedral, the eminent preacher and wit, painted by Henry P. Briggs, R.A., and presented by the Viscount Knutsford, G.C.M.G., a Trustee of the Gallery.

Samuel Sharpe, 1799-1881, translator of the Bible and Egyptologist, and Joseph Bonomi, 1796-1878, sculptor and draughtsman, both painted by Miss Matilda Sharpe, and presented by the artist and her sister.

The following portraits have been acquired by purchase:—

Thomas Osborne, first Duke of Leeds, K.G., 1631-1712, a full-length portrait in Garter robes, as Marquis of Carmarthen, attributed to Sir Godfrey Kneller.

John Hookham Frere, 1769-1846, diplomatist, author, and translator of Aristophanes, drawn by Henry Edridge, A.R.A.

Charles George Gordon, 1833-85, the hero of Khartoum, a sketch in oils by Professor Leo Diet, of Graz, taken at Cairo just before he left on his last journey to Khartoum.

#### GENERAL.

The Bethnal Green Borough Council, having modified clauses 4, 7 and 10 in the instructions to competitors for the municipal buildings, in accordance with the views of the President of the Royal Institute of British Architects, he has now appointed an assessor in the competition.

M. Albert Kaempfen, who during nearly a quarter of a century was connected with the administration of art in France, died on Sunday last. For five years he was director of the Louvre. By birth he was the son of a Paris doctor. He was in his eighty-first year.

Mr. Thomas Cartwright has been appointed headmaster of the Macclesfield School of Art, in succession to Mr. Ward, who was lately appointed to the Dublin School.

The Memorial Arch of the Royal Dublin Fusiliers at the entrance to St. Stephen's Green, Dublin, will be opened on Monday. It was designed by Mr. Howard Pentland, with Sir Thomas Drew, P.R.H.A., as consulting architect.

The Durham County Council invite applications before August 24 for the following situations in the Education Department:—(1) Assistant architect (salary 250*l.* a year), (2) a draughtsman (100*l.* a year), (3) a quantity surveyor (200*l.* a year), and (4) assistant to latter (100*l.* a year).

The Newcastle Corporation Town Improvement Committee have decided that unless the Northumberland War Memorial in Newcastle, which has remained in an incomplete state for months, is finished within six weeks, the city engineer will be instructed to remove the scaffolding and hoarding round the figureless column.

On Friday Mr. J. Wyatt Papworth, assistant electrical engineer to the Kilmarnock Corporation, was, out of eighty applicants, appointed manager of the Corporation Electricity Works, Stirling.

At the Next Meeting of the Hales Owen Council it will be proposed that a committee be empowered to consult with Lord Cobham, the owner of the abbey, and also the Birmingham Archæological Society, with a view to something being done to prevent the ruins suffering from decay.

The Manchester City Council last week resolved that the Lord Mayor and the Deputy Mayor be requested to ascertain the terms and conditions upon which the Platt Hall estate can be acquired, and to negotiate for its purchase, subject to the approval of the Council and the Local Government Board.

In the Excavations for converting the old sexton cottage at Ribchester into a villa residence the base was discovered of a column which it is believed formed part of a Roman temple. It was unearthed about 2 feet underground, well within the ascertained lines of the military camp, and not far from the spot where about nine years ago Professor Garstang discovered the granary and a great mass of charred wheat and barley.

The Edinburgh Dean of Guild Court have granted a warrant for the demolition of Falconhall mansion-house, another of the landmarks of the Scottish capital. The house was advertised to let last Whitsunday, but nobody came forward to take it, and being so near tenements, the Governors of the Edinburgh Merchant Company, to whom the place belongs, have, as already indicated, received a warrant to have it taken down so as to clear the ground for feuing.

A Collection of photographs of buildings occupied by the French embassies and legations throughout the world is to be prepared by order of the Foreign Minister.

Approval has been given by the French Council of Roads and Bridges of the plans for a tunnel which will connect the Marseilles Canal with the Rhone. The cost is estimated at 34,500,000 francs.

The Chicago City Council have appointed Messrs. Holaberd & Roche, of Chicago, as architects, and Mr. J. Ewen as consulting engineer for the new city hall, which is to be erected at a cost of 4,500,000 dol.

The Roman Camp at Newstead has been the scene of continuous investigations during the past six months, and connected with the large bath is a well, which has just been explored, and the following articles found:—A Pompeian bronze vase with finely-engraved ornamentation, and a chased handle with a terminal female head with eyes inlaid of silver; three smaller bronze vases of various shapes, one piece of playing dice of bone; two Roman swords and a bronze mask of Greek type which had been originally gilded.

A Chelsea Embellishment Association has been established on the lines of the Verschönerungsverein, which lately has done much towards the beautification and improvement of German cities. At a recent informal meeting held at More's Garden, Cheyne Walk, Chelsea, an address was given by Professor Geddes pointing out the actual and latent possibilities of Chelsea as an art and culture city and the ways of utilising and further developing these.

At the Last Bi-monthly Meeting of the Leicester and Leicestershire Architectural and Archæological Society attention was called to the recent discovery of a tenth century psalter at Bosworth Hall. There is said to be ample evidence to prove that this psalter was at one time in the possession of Archbishop Cranmer, and was part of a collection purchased by James I. for the Prince of Wales, and finally passed to the nation as the gift of George III. How it came to Bosworth Hall remains a mystery, but it is understood that the owners have offered it to the British Museum.

Mr. Lonsdale, M.P., on Monday asked the President of the Local Government Board whether he was aware that the rural district councils desired to co-operate with county councils in the mitigation of the dust nuisance by spraying the roads with tar; whether the Local Government Board had decided that the rural district councils could not incur expense in this direction; and whether some modification of the decision was possible. Mr. Burns replied as follows:—"I am aware of the desire referred to. I presume that the roads to which the hon. member alludes are main roads. These in rural districts are maintained by the county council, and the question is whether a rural district council can legally contribute towards the cost of spraying them with tar. They could do so if the operation could be brought within the terms of section 3 of the Highways and Bridges Act, 1891, but I am advised that cannot safely be held that this is the case."

Lord Knollys writes to the clerk of the London County Council:—"The King has been informed that there appears to be some chance of Crosby Hall, a building of great historic interest, being pulled down. His Majesty has seen the report presented to the London County Council on the subject, and commands me to inquire whether this report has met with a favourable response, and to express his hope that means may be found to preserve such an interesting relic of old London."

## THE WEEK.

It is satisfactory to learn that one public body has recognised that in a competition for a building a great many architects lose their time and labour in preparing designs without receiving a reward. An opinion to that effect was expressed at a meeting of the Southport Town Council last week. It is doubtful, however, whether the remedy adopted will be deemed satisfactory, if it consists in dispensing with a competition. It is proposed to erect a new school in Southport at a cost of £13,500; and it was arranged that the architect for a fee of 900*l.* was to provide all plans, specifications, quantities, measurements, and to pay his travelling expenses. It was contended that the sum was too high, and that competent architects were to be found in Southport who would perform the work for 500*l.* The Mayor said it was possible to have the plans prepared for 250*l.*, but from 6,000*l.* to 7,000*l.* might be lost under that arrangement. The expenditure of 900*l.* was therefore approved.

The invitation for British sculptors to take part in the competition for the erection of a statue of CONSTANTIN PALÉOLOGUE in Athens is, we suppose, a recognition of the skill attained during late years. The subject is interesting. Byzantine art has excited some interest in this country, especially since an adaptation of it was employed in Westminster Cathedral, and CONSTANTIN was the last Christian sovereign of Byzantium. He was, however, a vassal of the Ottomans, and in his time it was resolved that Constantinople should become the capital of the invaders. Unwisely CONSTANTIN asked that the subsidy he received should be increased, and that was taken as an excuse to make war upon him. He anticipated that the Christian States would come to his aid, but he was disappointed in the number of his auxiliaries. From the autumn of 1452 until May 1453 the city was besieged by MOHAMMED II. On the last day there was no difficulty in making several breaches. CONSTANTIN stood almost alone at one spot against his enemies. But he was killed and trodden under foot. His body was so defaced by the crowd of troops that it was only identified by means of some of the ornaments which he wore. It is suggested that the emperor should be represented standing on foot with the body of one of the janissaries stretched before him. On the pedestal there to be four reliefs illustrating the history of CONSTANTIN. The first prize will be 200*l.*, the second will be 80*l.*, and there will be three prizes of 40*l.* each. The committee reserve to themselves the right to give the commission for the memorial to one of the prize-winners or to another artist. The minimum height of the models in the first competition is to be one metre, including the pedestal.

In one of the reports of the factory inspectors we find the following complaint:—"It is difficult for us to deal with the prevention of accidents in the construction of buildings in the absence of any obligation on the part of the contractors or undertakers to notify their proceedings. Most master builders have been circularised as to their liabilities under the Act, but little notice is given until the matter is brought home by the occurrence of an accident. Even then much inattention is exhibited, and it has been necessary to take proceedings in some instances." By section 105 of the Factory and Workshop Act of 1901 several of the provisions are applicable to premises in which machinery is temporarily used for the purpose of the construction of a building. Practically the word factory comprises any building which exceeds 30 feet in height and which is being constructed or repaired by means of a scaffolding, and any

building exceeding 30 feet in height in which more than twenty persons are employed for wages. A builder takes the same position as the occupier of a factory; in other words, there are analogies between the Workmen's Compensation Act and the Factory and Workshop Act. It is no doubt a great inconvenience that not only builders' workshops but any works on which builders engage temporarily should be treated as if they were immense Lancashire or Yorkshire factories. But in this case the law is no respecter of persons.

At the time when eligible building sites are costly in England, it may appear incredible that in the neighbourhood of Birmingham a plot of land should be considered as derelict, and therefore allowed to be appropriated without any formal title. Over thirty years ago the Birmingham Freehold Land Society purchased an estate at Erdington, and divided it into lots. A Mr. DANIEL obtained one; but, as he thought it would be better adapted for building at a later time, he neglected it. To utilise the grass two donkeys were turned loose on the ground, and it was used for that purpose from 1879 to 1902. Then the owner wished to assert his rights. But the grazier claimed that his undisputed possession constituted him as owner. An action was brought to recover the land, and was brought before Mr. Justice SUTTON, who decided in favour of the owner of the donkeys. Owners of neglected building sites will do well to take a warning from the case and adopt occasionally some measures to assert their ownership.

ACCORDING to the returns of the Local Government Board for Ireland up to February 1, 1907, no less than 57,906 applications had been made for cottages, plots, additional allotments and tracts of land. Ulster made 11,572 applications, Munster 21,139, Leinster 17,332, and Connaught 7,863. Authority was given to erect 26,210 cottages, of which 21,948 were provided and 21,782 actually let. The rents paid up to March 31 last amounted to 50,795*l.* 2*s.* 10*d.*, and the arrears on that date amounted to 4,202*l.* 1*s.* 8*d.* It is not, however, within the power of statistics to record all the advantages which must arise from the introduction of so many improved dwellings. Some of them may not be so well constructed as is desirable, but the worst among them are far superior to those which for centuries sheltered the Irish peasantry. If comfort, convenience and cleanliness have any influence, then the Irish labourer should, under the altered conditions of life, attain qualities which will be advantageous to himself and his country. The author of one of the papers read before the British Association at Leicester maintained that the Mediæval churches produced surprising effects on the character of the humble classes of the Irish people, and if that theory can be accepted it can be concluded that to improved dwellings they will be also susceptible.

THE fortress of Kronberg at Helsingör is supposed to be the Castle of Elsinore which SHAKESPEARE has made immortal, and the flag battery is the platform in which the opening scene of the tragedy takes place. A statue of SHAKESPEARE by the Danish sculptor, M. HASSELRÜS, has been lately placed in the hall of knights of the fortress. The work becomes still more interesting through the inscription on the pedestal, which is to the following effect:—"Three centuries after SHAKESPEARE had composed his 'Hamlet,' and in the year when the Danish Princess ALEXANDRA was crowned Queen of Great Britain, the resolution was taken to erect this memorial, 1602-1902." When the great English poet utilised the Danish legend for his tragedy he could not have anticipated that such a tribute would ever arise in Denmark. But the statue will be another link in the chain which binds the two countries.

## TRIUMPHAL ARCHES.

THE power of association and tradition which has so long prevailed in architecture was again revealed on Monday by the inauguration of a triumphal arch in Dublin. If it had been said that a new entrance gateway was added to the large square known as Stephen's Green, not much interest would be attached to the ceremonial. But an imitation of a Roman memorial, although it may not be altogether adapted to meet modern necessities, has an attraction which compensates for its shortcomings. Whatever was done in the most high and palmy state of Rome is supposed to be unapproachable by modern efforts. In that way a gateway in Roman style is not tested or criticised by the ordinary rules.

HUME brought forward a great many arguments to prove that ancient cities, and Rome in particular, did not possess such large populations as was commonly imagined. Among others he investigated the total length of the streets. But he might have introduced the triumphal arches as evidence that the traffic could not have been very large. The nuisance of Temple Bar will not readily be forgotten in London. But only one was tolerated in the Metropolis, while in Rome there were several obstructions in the form of triumphal arches and other gateways. According to one account there were no less than thirty-seven gates in Rome, and apparently in designing them the question of tolls must have been considered, and the openings were accordingly of narrow span. Wider than any at Rome is the arch at Rimini, and yet the opening is only 31 feet, while the central span of the Arch of Septimius Severus in Rome is 22 feet. In the latter case it is doubtful whether there was a passage, and the structure was merely a memorial. The two arches on the boulevards in Paris—the Porte St. Martin and the Porte St. Denis—are now regarded as obstructions by most business people; and the magnificent Arc de l'Etoile, which is unsurpassed by any ancient work, is closed to traffic, and few people on foot care to pass under it. The Arc du Carrousel is also treated as a public monument, a mere spectacle. Even in Berlin there are proposals for the removal or transformation of the large Brandenburg Gate, which closes the principal thoroughfare at one end.

There is no doubt that when men began to congregate in cities there was a necessity to enclose them to insure safety. Earthen mounds or stone walls were employed for the purpose. The entrances required extra care, and were generally more efficiently fortified than other parts. If a prince or warrior who had benefited the inhabitants returned victorious, it was only fitting that some mode of decoration should be employed at the entrance where he was to be received by the people. But on such occasions temporary adornments would serve. It is not likely that the commonplace ornamentation which used to be set up at Temple Bar on special occasions differed much from what was adopted long before in a great many cities or towns.

It is well to distinguish between ordinary city gates and triumphal arches. It is doubtful whether such a phrase as *porta triumphalis* possessed any equivalent outside Rome and its dependencies. We suppose there was no entrance which was more dignified than the Propylæum of the Acropolis at Athens. But there is nothing to show it was ever utilised to perpetuate the fame of any Greek citizen. The Roman structures known as triumphal arches, on the contrary, had all a personal character. In some cases, as in the Arch of Constantine, there was a victory to commemorate which was the opening of a new era, and no scruple was made in carrying off the sculpture which was expressive of the victory of another emperor in order to gain better effect for the memorial. The Arch of Titus is supposed to celebrate not only the victory of the arms of Rome but of its gods over those of the East. They might even be used to re-

cord a much simpler incident. The Arch of Rimini which still exists, was simply intended to celebrate the mending of the roads of the district in the consulship of AUGUSTUS. With quite as much fitness an arch with Corinthian columns might be set up in any shire in England to demonstrate to posterity that the chairman of the roads committee had ordered the highways to be tarred and other improvements adopted in order to meet the wear and tear of motors. TRAJAN'S arch at Ancona is the celebration of the completion of the moor. The Arch of Septimius Severus, to which we have just referred, corresponds with the bridge said to exist near Blarney in Ireland, which is intended to span a river but was constructed in a place where no river was known. The Roman arch was never used for a military procession, although the sculpture on it suggests victories over Parthians and Arabians.

There were, no doubt, other triumphal arches in Rome which were removed, partly, perhaps, because they were in the way. But at the present time the nearest approach to a typical commemorative structure is the Arch of Titus. Unlike that of CONSTANTINE there is only a single opening, which at one period served as a gateway to the Frangipani fortress. From the circumstance that the Composite Order was first employed in connection with the arch we might conclude that unusual richness was sought after on all the faces which allowed of ornamentation. But severity prevails. It is remarkable to find the great reliefs which are the glorification of TITUS not on the external faces where all the Romans could see them, but on each side of the piers within the archway. One represents TITUS in chariot, the other suggests the captives and spoils of Jerusalem. On the exterior frieze the triumph over the Jews is further represented. The apotheosis of the emperor also appears on the intrados of the arch. It is now impossible to determine whether the exterior faces were not to be adorned with additional reliefs, for with the exception of the keystones the only sculpture to be seen outside is the narrow frieze. There was a field for the display of historic representations, and from the height given to the attic a large quadriga or other groups could have been erected without appearing as disproportionate. The Arch of Titus, as we now see it, contains a large amount of work which is not older than 1822. Because of the honesty of VALADIER, who had charge of the restoration, no one need confound the part which is ancient with the modern masonry.

The Arch of Constantine, on the other hand, suffers from an excess of sculpture. The figures are faded, and the full effect of the architecture is accordingly diminished. From the summit to the ground the hand of the sculptor is to be seen, and, as in the Arch of Titus, reliefs appear within the principal archway. When in a perfect state the figures were of higher character than is usually supposed. Apparently they represent the public as well as the private life of the emperor, or rather the emperors. Why it should be necessary to despoil the Arch of Trajan for the figures of the captives and for several of the reliefs is inexplicable, unless we can suppose there was an eagerness to have the work completed. But that one man's records should serve for the honouring of another man who lived more than two centuries later is a circumstance which is not creditable to the Roman people. Where the arch stood which was plundered is now uncertain. Its fate and that of other structures are enough to suggest that the temporary decorations of the simple Fabian arch referred to by CICERO were quite adequate for the Romans, who were not constant in their reverence for their great men. At one time, as we have said, there were thirty-seven triumphal arches in Rome, and the few which now remain are enough to suggest how difficult it is for any kind of structure to resist the influence of time.

Where the conditions are limited, as in Dublin, it may be advantageous to set up a gateway which is

imitation of a Roman example. But it must be said the days for triumphal arches of the Roman type have passed away. They may serve as entrances to a park or to mark the limits of the roadway of a bridge, but in the streets of a city they are impracticable. Traffic is now so onerous in the majority of cities that only wide streets can serve. The span of the Arc de l'Etoile is 165 feet and the height of the opening is about 96 feet. At the present time if the monument were intended to meet the traffic at that part of Paris the roadway should at least be 100 feet in width. We can thus imagine the height to which the structure would have to be carried in order to appear proportionate. CHALGRIN's great work is therefore a memorial in the form of a covered roadway, but one which, owing to its value, cannot be used for the purpose for which it was designed. It is consequently a warning against the adoption of a triumphal arch, unless people prefer imitations to realities.

### DA VINCI'S "CENACOLO."

THE value of DA VINCI's *Last Supper* has been so well recognised of late years, the old allegations about the rain pouring down the wall on which the painting was executed, the broken windows and the open door no longer apply. But recently works were undertaken for the purpose of more efficiently preventing damp and securing ventilation—the two evils of the large room—and they have been completed. A new doorway has been opened into the refectory, and on passing through it the great picture appears more impressive at first sight. It is believed that every year at least 50,000 people visit the place, and though large photographs are easily to be obtained, copies continue to be made of the famous work.

As in other cases connected with LEONARDO DA VINCI, *The Last Supper* from the first appeared, as were, controlled by an adverse power. It is now possible to say when the work was commenced. DA VINCI was engaged by the Duke of MILAN at some time between 1483 and 1485, and he rendered manifold services until the fall of LUDOVICO in 1499. There is no document to show whether before or after that event the great painting in S. Maria delle Grazie was undertaken. The belief prevails that he was at work on it in 1496 and 1497.

Several studies exist for the figures, and they show the great care DA VINCI employed over details. BANCELLO, the novelist, may not have the position of an historian, but he relates that he often saw the painter during the hottest days of July suddenly abandon the great statue of SFORZA, on which he was engaged, and rush to the convent in order to add two or three strokes to the painting. At other times he was observed to remain in contemplation before it during a whole day, regardless of the flight of time. The then Dominican prior, for whom every hour had its fixed duty, could not understand so much absorption unless in a religious ecstatic; and he complained to the Duke of the inconvenience suffered by the community through the painter's inactivity. But, slow as was the representation of the eleven Apostles, it seemed expeditious compared with the time required to realise the highest and lowest of all, *i.e.* CHRIST and JUDAS. JUDAS might be supposed to have been the easiest of all the Apostles to imagine, for the early study at Windsor, which suggests a cruel, rapacious man, does not differ in character from the countenance which was subsequently painted. The other heads are supposed to correspond with the characteristics suggested by the Evangelists. But it is worth remembering that, in one of the sketches for the painting, LEONARDO inscribed the names over the heads, in that way the tradition of identification has come down to us.

At the close of the fifteenth century oil-painting might be considered somewhat as a novelty. It was,

however, adapted to the habits of DA VINCI. Fresco required decision as well as expeditious handling. A large picture could not be produced in that medium at the rate of a few strokes a day. DA VINCI loved to play with painting, as with everything else, and, in the interval of laying on the colours, to make many experiments. It is possible that the paints he employed were the results of his own discoveries in chemistry, for the painting was hardly completed before it exhibited signs of decay. That was an unusual effect in those days. VASARI, when he saw it some years afterwards, considered the painting was not finished, and what had been done, was, he declared, owing to the dampness of the wall, in a deplorable state. All the accounts given by travellers agreed in recording the decay of the work. Cardinal FREDERIGO BORROMEO considered the monks were to blame for the state of the picture and ordered measures to be adopted to prevent further injury.

The first English traveller to mention it was JOHN EVELYN. In 1646 he was in Milan, and in his diary he says:—"We concluded this day's wandering at the Monasterie of Madona della Gratia, and in the Refectorie admir'd that celebrated *Coena Domini* of LEONARDO DA VINCI, which takes up the entire wall at the end, and is the same that the great Virtuoso FRANCIS THE FIRST of France was so enamoured of, that he consulted to remove the whole wall by binding it about with ribs of iron and timber to convey it into France. This incomparable piece is now exceedingly impair'd." In the early years of the eighteenth century the picture was seen by the RICHARDSONS, who were painters as well as connoisseurs. The account given is one of the most exact which has appeared, and deserves to be better known:—

In the refectory over a very high door is the famous picture of *The Last Supper*, figures as big as the life; it is excessively ruined, and all the Apostles on the right hand of the Christ are entirely defaced; the Christ and those on His left hand appear pretty plain, but the colours are quite faded, and in several places only the bare wall is left; that which is next but one to the Christ is the best preserved (he that crosses his hands upon his breast) and has a marvellous expression, much stronger than I have seen in any of the drawings. Armenini (who wrote about the year 1580) says this picture was half spoiled in his time. That story of the head of the Christ being left unfinished, Leonardo conceiving it impossible for him to reach his own idea, is certainly false, because one part of that head which remains entire is highly finished in his usual manner. They have nailed the Emperor's arms over the Christ's head so low that it almost touched His hair, and hides a great part of the picture.

In 1739 the President DE BROSSES, who might be supposed to have visited Italy in order to make an inventory of the works which half a century later were to be wrenched from the Italian galleries in order to enrich the Louvre, glanced at the *Last Supper*, but evidently confounded it with the *Crucifixion* of MONTEFANO, which is on the opposite wall and is still fairly bright, for he says it was the first example of fresco which gave him pleasure, but he considers all the faces were very ugly. In justice to DE BROSSES it must be said that what he saw was not DA VINCI's picture but BELLOTTI's restoration of it. His handiwork was not, however, destined to be perpetuated.

JAMES BARRY visited Milan in 1770, and in the course of a lecture which he delivered in the Royal Academy he described what he saw perpetrated:—

This glorious work of Leonardo is now no more. I saw the last of it at Milan; for, in passing through that city on my return home, I saw a scaffold erected in the Refectory, and one half of the picture painted over by one Pietro Mazzi; no one was at work, it being Sunday, but there were two men on the scaffold, one of whom was speaking to the other with much earnestness about that part of the picture which had been repainted. I was much agitated, and having no idea of his being an artist, much less the identical person who was destroying so beautiful and venerable a ruin, I objected with some warmth to the shocking ignorant manner

in which this was carried on, pointing out at the same time the immense difference between the part that was untouched and what had been repainted. He answered that the new work was but a dead colour, and that the painter meant to go over it all again. Worse and worse, said I; if he has thus lost his way when he was immediately going over the lines and features of Leonardo's figures, what will become of him when they are all thus blotted out, and when, without any guide in repassing over the work, he shall be utterly abandoned to his own ignorance? On my remonstrating afterwards with some of the friars, and entreating them to take down the scaffold and save the half of the picture which was yet remaining, they told me that the convent had no authority in this matter, and that it was by the order of the Count de Firmian, the Imperial Secretary of State. Thus perished one of the most justly celebrated monuments of modern art, particularly for that part of design which regards the skilful delineation of the various sentiments of the soul in all the diversities of character, expression of countenance and of action.

At the time of the French invasion the monastery was converted into a cavalry barracks and the refectory was used for the storage of hay. BUONAPARTE took care to visit the place, and made a show of having as much admiration for DA VINCI's work as was displayed by FRANCIS I. It is related that when seated before the picture he wrote on a paper placed on his knee an order by which the place was to be exempted from military use; but no one knew better than himself that under the circumstances the monastery could not be given up. When EUGÈNE BEAUHARNAIS became governor he took care to have the refectory cleared, and he had a scaffolding placed before the painting, partly for its protection and partly to enable the visitors to examine it more closely. But too many tourists committed depredations. They were the culprits rather than the troops who were supposed to have made a target of the painting. Although an examination has been made, pistol marks have not been discovered on any part of the surface.

GOETHE did not see the painting until about 1780, and yet he was under the delusion that he saw it in an unrestored state. There is little doubt that several restorations took place, and the latest was passed off as the first. The German traveller could only judge of the arrangement or dramatic action, and it suggests his power of insight when we find him producing so excellent a description. GOETHE believed the ruin of the picture commenced with the opening of the door to which a part of the figures had to be sacrificed. But the colouring had faded at an earlier time. We learn from GOETHE that towards the close of the eighteenth century the dampness had so far increased, it was considered necessary to close up the entrances. Anyone who wished to see *The Last Supper* had to ascend a ladder and peer through a very small aperture. At a later time another policy was adopted and more windows were formed. It can be said, however, that rational remedial methods were not adopted before the works just completed. Everyone must desire they will be effectual. It is true that the world must henceforth be satisfied with a costly restored work. We cannot be certain that the colouring corresponds with DA VINCI's, and the treatment of the figures is wanting in that magic which he could impart. But in composition and scale the restored work is on the whole trustworthy, and while it exists it will be one of the wonders of art. Besides, more importance is attached to such an old copy as that belonging to the Royal Academy, or those to be seen in Milan, for they cannot be considered as imaginative.

**An Appeal** has been made for subscriptions towards the balance—about 15,000*l.*—required to complete the purchase for the Church of England of Glastonbury Abbey. The Bishop of Bath and Wells, through the generosity of a layman who advanced the money, was able to purchase the ruins for the sum of 30,000*l.* The bishop is forming a committee to hold the property in trust, and to determine the way in which it shall be used.

## THE LIGHTING AND VENTILATION OF CLASSROOMS.\*

I AM afraid there is nothing new that can be written on this subject, and I make no claim to any originality in these remarks, merely recording my own experience on what I believe to be the present practice in England. The reason, I presume, that led to this subject being selected for discussion at this Congress is the importance of the classroom as that section of the school building in which the scholastic portion of the teaching is carried on. Here the scholars spend practically all their school hours, here their mental powers are put to the greatest strain, that it is desirable that everything possible should be done to place them under the best physical conditions. The size of classrooms is obviously closely related to the subject of lighting and is necessarily regulated by the size of the classes. These vary from the fifty or sixty scholars more allowed in a public elementary school to the fifteen to thirty in a secondary school. The size is also regulated by the seating arrangements adopted, single seats taking more space than dual, the width of gangways and master platform being also factors in the case. The purpose for which a classroom is put will also necessarily affect its size, but I am assuming that the classrooms at present under discussion are the ordinary ones in which general subjects are taken.

The Board of Education lay down an average of not less than 10 square feet of floor space for each scholar in public elementary schools, and in this country this is generally adhered to; while in secondary schools, where single desks are used, a floor area of from 17 to 18 square feet is required, though, under certain circumstances, a minimum allowance of 16 square feet will now be accepted by the Board of Education. Given therefore the number of scholars to be provided, the above requirements fix the floor area of the classroom; but there still remains the comparative length, breadth and height to be determined, matters on which the effective lighting and ventilation must largely depend. The breadth and length are, to some extent, governed by the type of seat employed, but the nearer the room approaches a square the better, with the limitation that a room can hardly be satisfactorily lighted more than 24 feet wide, while 22 feet is better.

We will assume that the room is lit, as it should be, from one side only, which at once limits the depth from 20 to 24 feet; the length will then depend upon the number to be seated. The height of the room is also an important factor in the lighting, as the deeper the room the higher should be, if the seats furthest from the window are to be properly lighted. For the purposes of acoustics and ventilation 12 feet is generally a sufficient height, though, if a large number are to be accommodated, 13 to 14 feet height may be necessary. These regulations work out for a classroom in a secondary school for twenty-five scholars at 23 feet 6 inches by 19 feet by 12 feet high. Having settled the size of the classroom, the question of lighting has to be considered more in detail. It seems hardly necessary to mention that it should be lighted from the left hand of the scholar only. The size of glass area to be provided is most difficult to lay down. This will be affected by two considerations—the aspect and the situation. To take the latter first, it is obvious a town school in a crowded part would not obtain so much light from a window of a given area as buildings opposite as a building situated in the open country with an unobstructed prospect. The same applies in some degree to the aspect, windows quite satisfactory for a northern aspect being unsuitable for a southern one. Classrooms should be so placed that they have sun in the morning during part of the day, but not always; north, west or south-west, if unprotected, should be avoided. The Board of Education lay down one-fifth as the approximate area of window glass to the floor area to light a classroom satisfactorily. In very confined sites, however, one-quarter sometimes found necessary and in open and exposed sites one-sixth will sometimes suffice. Anything beyond this amount of glass actually necessary to give a satisfactory light is undesirable, as it tends to make the room cold in winter and hot in summer, and adds considerably to the difficulty of the effective treatment of the room, both externally and internally. The glass line should not be more than 4 feet above the floor, with the heads of the windows carried up as near the ceiling as possible.

The windows should be so arranged in the wall that

\* An address by Sir Aston Webb, R.A., delivered at the International Congress of School Hygiene.

the seats are equally well lighted. This is apt to leave the master's desk somewhat under-lighted, and in order to rectify this Mr. Bell and I provided in the classrooms at Christ's Hospital a small window to light the master's desk, kept low down so that he can also see out of it, and I believe this has been appreciated. Under no circumstances should there be windows facing the scholars, and windows in the opposite wall facing the master are almost equally objectionable. Mullions, transoms and window bars are, in my opinion, unobjectionable if the glass area is calculated independently of them. Plain sheet or plate-glass is the best for glazing, and the view of the sky should not be shut out from the scholars. Glazed brick or tiled walls, except as dados, are not suitable for classrooms of the character we are considering; the reflected light is trying to the eyes, and being non-porous they are not considered hygienic for crowded rooms. A white plaster ceiling is the best with light green or grey walls according to aspect, the woodwork painted white or, better, left its natural colour. A glare in a classroom is to be as carefully avoided as gloom. The artificial lighting of classrooms, perhaps, hardly comes under consideration to-day, but it is of equal importance where much evening work is done. Carefully-regulated incandescent electric lighting is the best, and greatly simplifies ventilation. Gas is better avoided. Perhaps the best illuminant is composed of inverted arc lights with the room lit by reflection from the ceiling, but it is extravagant in current. Single incandescent lamps equally distributed over the ceiling give a pleasant and well diffused light. Groups of lamps in electroliers should be avoided in classrooms. One eight-candle lamp, if not hung too high, should light sufficiently 24 feet super of floor area.

For the ventilation of classrooms it is more difficult to lay down any definite rules. The problem may be simply stated as follows:—

The time required to contaminate the air in a classroom of an elementary school of the capacity required per scholar—i.e. 10 feet per scholar—is eight minutes, while for that of a secondary school it would be a quarter of an hour. The temperature of the room, according to the rules of the Board of Education, has to be kept at from 56 degs. to 60 degs. Fahr. The problem, therefore, is how to change the air of a classroom from four to eight times an hour, and, at the same time, to avoid draughts and keep the temperature at from 56 degs to 60 degs. In discussing ventilation it is not possible to exclude altogether the question of heating. This can be done by open fireplaces, hot water, or steam and warm air. In one set of competition conditions sent to me I was surprised to find a condition, drawn up by an eminent architect, stating that the top of the fireplace openings should be 4 feet 6 inches high above the floor. I subsequently learned that this was provided on the strength of an instance where it appears such openings were provided, and it was noticed the boys did not progress so well after they had grown above this height, the idea being that the air in the room was better at the lower level through the ventilation of the fireplace. Whether this was a fact I cannot say, but the regulation was not insisted upon when the building came to be erected.

Still there is, I think, undoubtedly in England a strong preference for the open fireplace and the open window, and no doubt there is much to be said for them, especially in small schools; in larger ones it is impracticable. At the same time, I am strongly of opinion that an elaborate system of heating and ventilation such as may be very necessary in such buildings as law courts or hospitals is not necessary in a school for healthy boys and girls. The open fireplace not only provides heat, but also a means of ventilation, and should be placed in the angle on the inner wall near the door, not on the window side, which is an outside wall, and which in such a position must place the unhappy master in a draught between the door and the fireplace. An extract can be obtained by another flue in the chimney-stack, and fresh air may be admitted at the back of the grate and from the corridor. By this means, however, it is impossible to insure with any certainty a regular change of air in the classroom or an even temperature. All extracts which are worked by what are called natural causes are, in my opinion, unreliable and under certain variable conditions of temperature or wind pressure work uncertainly and sometimes even in directly opposite directions to that intended. To obtain results unaffected by these variations, mechanical means must be employed in the shape of rotary fans or other contrivances either to move the air by extraction or propulsion. If extraction is adopted, probably the best plan is hot-water radiators under the windows fitted

with bafflers, behind which the fresh air admitted from outside is warmed by passing over the radiators and the foul air is mechanically extracted at the ceiling level in the wall opposite. By this means, and with regulators on the inlets and outlets, the system can be sufficiently regulated, but it is as well also to supply an open fireplace, though the mechanical extract may interfere with its draught at times. The size of both the inlet and outlet depend upon the power of the fan employed. The alternative is the propulsion of warm air into the room by a fan, the air being admitted into the room about 2 feet below the ceiling, the outlet being at the floor level into the corridor immediately below the inlet over. The advantages of this system are the more equal distribution of the heat throughout the room, the absence of all heating apparatus such as radiators in the room, the avoidance of draught, the air in the room being under slight pressure, and the ease with which the apparatus can be used for ventilation purposes in summer time. The system requires to be planned with the building, and cannot, therefore, well be applied to old buildings. Each system, however, has its advantages, according to the size and special circumstances of the building; and with mechanical means now so readily at our disposal, there should be no difficulty in providing either the temperature or change of air that our medical advisers may decide from time to time to be necessary or advisable, for, after all, we must look to the medical profession to lay down the hygienic requirements of the children to be accommodated in these rooms, which it is our humbler but equally necessary part to see carried out as effectually and economically as possible.

### CORROSION OF IRON.

SOME important investigations of the effect of stress on the corrosion of iron have been in progress, which Professor William H. Walker and Mr. Colby Dill have been conducting at the research laboratory of technical chemistry at the Massachusetts Institute of Technology. The authors consider, says the *Engineering Record*, that a definite relation exists between electromotive force and corrosion, and that the corrosion of iron in water depends essentially upon three factors, the electrolytic solution pressure of the iron, the electrolytic solution pressure of hydrogen, and the condition of surface of the iron or metal in contact with the iron, in so far as it affects the ease with which molecular hydrogen may be liberated on it. In an experiment the last two factors may be held practically constant, and the electromotive force of the system made to depend for the greater part on the solution pressure of the iron. In the paper read before the American Electrochemical Society the authors deal with a single one of the conditions which affect the electromotive force of iron, the effect of stress on the metal. The particular problem investigated was the determination of the sign and magnitude of the potential changes caused by straining a piece of iron, particularly below the elastic limit.

The magnitude of the increase of potential which one would expect to be produced can be easily computed on the assumption that the energy stored in the specimen below the elastic limit is available as potential. Some very pure Swedish charcoal iron was tested in the usual manner to determine the modulus of elasticity and the elastic limit. From these data the maximum amount of work which it is possible to do on 1 cu. in. of soft iron by stretching it to its elastic limit was calculated to be 5.16 in.-lbs., which is equal to 5.83 joules. One cubic inch of soft iron weighs approximately 126 grammes, the specific gravity being 1.7. The work done in joules per equivalent is therefore 1.30, and the change in electromotive force which would be expected is 1.30 joules divided by 96,540 coulombs, or 0.0000134 volt. The magnitude of this change is therefore very small; its direction should be positive, because it is the manifestation of energy stored up in the metal.

The paper gives the results of experimental measurements by the Poggendorf method, using a cadmium cell as standard electromotive force. The specimens of iron tested were made from two lots of exceptionally pure Swedish charcoal iron. One lot was hard-drawn wire about 0.25 inch in diameter, and the other was bar-iron about 0.5 inch in diameter. The bars were cut in lengths of about 18 inches and the central portion reduced in a lathe for a distance of about 1 inch until a zone of bright new metal was exposed. This band was smoothed in the lathe first with a file and finally with emery cloth. With the exception of a narrow zone about 0.25 inch wide at the middle, the bars were

covered with several waterproof coatings of ordinary shellac to insulate the metal from the solution except at the desired point.

The cell consisted of a central tube about 3 inches long and 1 inch internal diameter, open at both ends. To this were bound by means of adhesive tape three smaller tubes of the same length closed at the bottom. The bottom of the central tube was closed by a rubber stopper, carefully cleaned, through which the iron part projected, so that the reduced portion came at the middle of the tube. The central tube containing the specimen was filled with ferrous sulphate and then the three outer tubes were filled, one with ferrous sulphate and two with potassium chloride. All four tubes were then connected by syphons. The syphon of the normal calomel electrode dipped into the last potassium chloride tube. These precautions were successful in preventing the diffusion of  $\text{FeSO}_4$  into the tube containing the normal electrode. The  $\text{FeSO}_4$  solution was protected from air by a layer of paraffin oil carefully washed to remove traces of alkali or acid. The loads were applied with a testing machine operated by hand, as a power machine rendered potential measurements out of the question.

Tests were made with a large number of pieces of iron which were subjected to increasing stress up to the breaking point; a typical test was as follows—the stress was applied uniformly and gradually increased. The potential dropped simultaneously very slowly until at a stress of about 31,000 lbs. per square inch of original section the electromotive force had decreased 0.9 millivolt. When the machine was stopped at this point the beam of the machine sagged. When stress was again applied the potential rose suddenly 3.9 millivolts, and when the machine was stopped it dropped to its former value in fifteen seconds, then sank more slowly to a minimum and then started slowly to rise again. When load was put on a second time the character of the change was similar to the first, there being first a sharp rise of electromotive force while the load was increasing, followed by an abrupt fall when the machine was stopped, then a slower fall, then a rise to a constant value. The magnitude of the sudden rise depended upon the rate at which the stress was applied. The final value after fracture was about 8 millivolts higher than the initial value.

The cause of the abnormal rise observed at high stresses was next investigated. Change in temperature suggested itself as the most probable cause, although iron under these conditions has shown itself to have a negative temperature coefficient. In order to duplicate as nearly as possible the thermal conditions which obtain in the iron electrode, a device was used whereby there was a continual flow of heat from the electrode to the solution. A hole about  $\frac{1}{8}$  inch in diameter was drilled throughout the length of one of the electrodes. The upper end was joined by a rubber tube to a reservoir directly above, holding about two litres. A copper-nickel thermopile was soldered to the surface of the electrode where it was in contact with the liquid. The copper, nickel and solder were insulated from the solution by means of shellac. Hot water was placed in the reservoir and allowed to flow down through the electrode, the rate being regulated by a screw pinchcock. The test showed that a rise in temperature produced a decided decrease of electromotive force. The experiment was repeated with additional precautions and entirely concordant results were obtained.

If the sudden rise in potential above the elastic limit is caused by temperature changes in the electrode, then, since iron has a negative temperature coefficient, the specimen must cool off as the breaking load is approached. Such a phenomenon, though highly improbable, is perhaps conceivable. Experiment showed, however, that there is a continuous rise in temperature from the elastic limit to the breaking load. The rise in temperature in this test was determined by means of the copper-nickel thermopile previously used.

An experiment was also made with normal ferric chloride as electrolyte to see if this change in potential below the elastic limit also occurred. The specimen was prepared in identically the same manner as the previous ones. Soon after immersion in ferric chloride it became coated with bubbles of hydrogen and the surface lost its metallic lustre and grew black. The potential rose rapidly during the first and second days. On the third and fourth days the potential was not measured. On the fifth day it had risen from 0.5279 to 0.6638 volt and was very constant. Scraping the specimen by means of a sharp wire produced a decrease of 0.0031 volt. On the sixth day the bar was

pulled nearly to fracture. The potential decreased gradually 0.0006 volt from 1,200 to 32,600 lbs. (yield point) per square inch. Here the potential rose as in all previous cases, but the subsequent behaviour was irregular. This experiment confirmed the previous ones with ferrous sulphate as electrolyte.

If there is any permanent difference in electromotive force between a strained and an unstrained piece of metal, it should be apparent in the case of hard-drawn wire when compared with the same wire annealed. A number of specimens of steel wire in its strained condition were obtained and portions of each specimen carefully annealed in a vacuum. In almost every case a difference of potential was observed between the annealed and unannealed specimen; but further investigation showed that as great, and frequently greater, differences existed between the different portions of the same wire, both in the strained and the annealed condition.

The results of the experiments are summarised by the authors of the paper as follows:—

1. The magnitude of the potential changes suffered by soft iron when tested in a tension machine below the elastic limit is exceedingly small. In the majority of cases it was less than 0.0001 volt. The maximum change was 0.0004 volt.
2. The change, when great enough to be measured, was negative, *i.e.* the strained metal had a slightly lower potential than the same metal unstrained.
3. Somewhere above the elastic limit the potential rises suddenly several hundredths of a volt. The magnitude of the increase depends on the rate of straining and ceases abruptly when the straining ceases.
4. Measurements on specimens under torsional stress give results similar to those obtained from tension tests.
5. Out of a considerable number of specimens strained to breaking, the potential of six reached a constant value shortly after fracture. The difference between the initial and final potentials varied from -0.00019 to +0.0077 volt, and the single potential of unstrained metal was found to be 0.156 volt.

#### DUBLIN MEMORIAL ARCH.

THE Royal Dublin Fusiliers Memorial Arch, which was inaugurated by Field-Marshal His Royal Highness the Duke of Connaught, K.P., on Monday, is in the form of a Roman triumphal arch, spanning the north-west entrance of St. Stephen's Green Park, and was originally suggested by Sir Thomas Drew, P.R.H.A. (one of the members of the committee), who has kindly acted as consulting architect.

Mr. Howard Pentland, R.H.A., whose services were lent by the Board of Works, is the architect, and in his design, which in its main proportion bears some resemblance to the Arch of Titus at Rome, he has very successfully worked in the four existing granite piers, raising them on a continuous curved plinth, increasing their apparent width by the introduction of some rusticated courses, and running their main lines to the piers to form the impost. The archway is 12 feet in width, and springs from rusticated piers, each intersected by a pedestal and a pair of pilasters, supporting a Doric entablature. The frieze bears on its four elevations the names in gold of the principal actions in the South African war in which the regiment took part, viz. "Talana, Colenso, Tugela Heights, Hartshill, Ladysmith, Laing's Nek."

The entablature is surmounted by an attic storey broken over the pilasters, and bearing two inscription panels. The obverse contains the Latin words suggested by the Right Hon. Mr. Justice Ross (a member of the committee):—

"Fortissimis suis Militibus  
Hoc Monumentum  
Eblana dedicavit. MCMVII."

The first word alludes to the compliment conferred on the Dublin Fusiliers by the Commander-in-Chief of the Natal army, who directed the regiment to lead the relieving forces into Ladysmith.

The reverse contains the following inscription:—

"In memory of the Officers, Non-Commissioned Officers and Men of the Royal Dublin Fusiliers who fell in the service of the country in the South African War, 1899-1900 A.D."

The inscriptions are in keeping with the severity of the arch itself, composed, as it is, of granite and millstone.

The front keystone supports a bronze cartouche flanked by branches of bay, bearing the arms of the regiment. This has been modelled by Mr. Emery, of Great Brunswick

Street, from a drawing made by Mr. Pentland. Within the arch appear the names of the gallant 212 who fell in the war.

The total width of the arch and piers is about 33 feet, and the height is about the same. The total width of the new entrance, including the flanking piers and curved railings, is about 86 feet.

The main structure is of grey granite from Ballyknocken, co. Wicklow, and the inscription panels are of Sheephouse limestone, from Drogheda. The style, too, is Irish, recalling the days of Gandon, Castle and Ivory, whose Renaissance work has contributed so much to the characteristic qualities of eighteenth-century Dublin.

The site was granted by the Commissioners of Public Works. The contractors are Messrs. Henry Lavery & Sons, Ltd., of Belfast and Dublin. The sub-contractors for the iron gates and railings and for the bronze cartouche are Messrs. J. & C. M'Gloughlin, Ltd., of Dublin.

### A DUNDEE RELIC.

DURING the course of extensive alterations on the property in the Vault, Dundee, so long occupied by the late Colonel William Smith, and now by his son, Mr. Harry K. Smith, some curious structural features have been disclosed which connect this building with pre-Reformation times. The architects in charge, Messrs. Thomas & Wilkie, F.F.R.I.B.A., having called attention to these discoveries, an examination of the proprietary history of the building, says the *Dundee Advertiser*, has given the following results, which rest upon documentary evidence. The facts disclose something of the social life in Dundee nearly four centuries ago.

The church of St. Clement, which was the oldest church in Dundee, dated from the beginning of the twelfth century. It stood on the site of the present Town House, and its ruins were only cleared away in 1730, when the building was erected. In 1868, when an extension of the Town House was made, some of the carved heraldic stones that had decorated the original church were built into the new addition, and may still be seen on the west gable. But St. Clement's Church had lost its dignity hundreds of years before these recent dates. When David, Earl of Huntingdon, about 1199, decided to build a church in Dundee dedicated to St. Mary, the doom of St. Clement's was sealed. The Earl's Church became the fashionable resort, and the older edifice was permitted to crumble away. About 1500 the structure had been partly repaired, though at the attack on Dundee by the English in 1547 the old church was laid in ruins. Shortly afterwards, when the Town Council wanted a new Tolbooth, they used some of the ruined walls of St. Clement's Church for that building. Previous to 1564 the kirkyard of St. Clement's was the chief cemetery of Dundee, until Queen Mary gave the orchard of the Greyfriars (now the Howff) as a burying-ground. Before that time, however, some of the leading merchants and town councillors had helped themselves to feus on the ground of the kirkyard, and the house with which we are now dealing was one of the earliest buildings so erected.

George Rollok was one of the prominent merchants in Dundee early in the sixteenth century, and held the office of bailie for several years. He was married to Margaret Wedderburne, a member of another important Dundee family, and in 1535 they vested their property in their son, Richard Rollok. It is probable that the house in the Vault was built by George Rollok before his death, which took place about 1540. The son, Richard Rollok, lived in this mansion, and when he died, in February 1560, his son, Robert Rollok, obtained possession of the house as heir of his father. In the Sasine Records of Dundee the house is described as "lying on the west side of St. Clement's church, having the said church's cemetery on the east, the great Close built by James Lovell on the west, the land built by the said James Lovell and occupied by James Mitchell on the north, and the land of George Lovell on the south." This exactly describes the present position of the house. The mansion remained in the possession of the Rolloks until July 1643, when "the heirs of the late David Rollok" sold it to Robert Fletcher, who was then proprietor of the tenement immediately to the south of it. In course of time the Fletchers had sold portions of the property, but late as 1865 a flat in this building belonged to Agnes Watt, widow of Robert Fletcher, "some time spirit dealer, Vault, Dundee." The southmost of the two shops (Nos. 9 and 11 Vault), which belonged to the late Colonel Smith, and which was the original Rollok

mansion, was in the hands of "Paul Farquharson of Pear-side, some time vintner in Dundee," early in the last century. From existing title deeds it appears that Paul Farquharson had "rebuilt" the tenement, though this can only mean that he had covered portions of the stonework with plaster, which still remains. Unquestionably the main structure is as it was erected by the first of the Rolloks nearly four hundred years ago. Paul Farquharson removed about 1850 to 3 Barrack Street, where he established the Swan Inn, which was carried on by his widow for some time after his death in 1855. About this time the ground storey and cellars of Nos. 9 and 11 were the property of Isabella Campbell, daughter of the deceased James Campbell, who had been a farrier and veterinary surgeon in Dundee from the beginning of last century; and it was during Campbell's time that Paul Farquharson altered the front of the shop, covering up part of the old stonework with cement. The shop No. 9 was occupied by the late Colonel Smith from 1865 till his death, and is now in possession of his son, Mr. Harry K. Smith. Colonel Smith's predecessor was William Paxton, who began business here as ale and porter merchant in the late "thirties," and latterly developed a wholesale trade.

The centre archway formed the door of the frontage of the southmost shop facing the vault in the early sixteenth century, giving access to the ground floor, and the arches on each side were originally openings which may have been filled with glazed casements reaching down to the pavement. The pillars are well-proportioned and show distinctly Scottish character in the bases and capitals. The arches vary slightly in width, but are constructed on the same principle, with keystones, the springing of the outer arches being from pilasters uniform in style with the centre pillars. When the front was covered up with cement, the centre arch had been partly cut away so as to make a higher square-top door; and it proves the strength of the old masonwork that this alteration has not affected the stability of the building. Indeed, the whole structure displays the idea that these old mason-builders "built for posterity." The inner wall is nearly 7 feet thick, although there is no apparent reason for such solidity. The cellars, which extend below the building and out beneath the pavement, are strong barrel-vaulted structures; and what appears to have been the kitchen is also constructed of masonry that has withstood the tooth of time. An old doorway in the kitchen leads out to an area from which access is obtained to Crichton Street by a stone staircase. It is the intention of Mr. Smith to alter this shop on the ground-floor and arrange it in a style that will accord with the architecture of this venerable old building.

While the alterations were in progress a curious stone lintel, over 6 feet long by 13 inches high, was discovered. The initials I. M. are those of John Man, a leading merchant and bailie in Dundee from 1670 to 1690; while the monogram surmounted by the figure 4 shows his merchant's mark, that figure having indicated from a remote time the "Four Burghs"—Edinburgh, Berwick, Stirling and Roxburgh—that regulated the commerce of Scotland. The other initials are those of John Man's wife, M. S., whose surname has not yet been discovered. There is no document as yet found to show that Bailie Man was proprietor of the mansion in 1675, though he would not have carved a lintel so elaborately for a house unless he was sure of "fixity of tenure."

In His Second Report to the executive committee on the progress of the work of preservation of Ayr Auld Brig, Mr. W. S. Wilson, C.E., Glasgow, the engineer, states that the pointing of the two arches and two piers, as well as two-thirds of the third arch, is done. The roadway for a length of 200 feet has been removed, and arches Nos. 1, 2 and 3 have been strengthened in the manner described in his last report. The central spandril walls have been built on three arches. The external spandril walls of arches Nos. 1 and 2 were found to be of substantial thickness, but in arch No. 3 they are too thin, and he proposes to strengthen them by adding a foot to their thickness on the inside. A good deal of grouting has been done. The hand machine having been found to be too slow, a small  $\frac{3}{4}$  horsepower electric motor has been hired, and this part of the work will now go on more rapidly. The pits in piers Nos. 1 and 2 are being sunk—the first being down 26 feet from the road level. There are twenty-one men employed on the bridge, and the expenditure to date, including wages, plant and material, has been 437/.

## NOTES AND COMMENTS.

It was mentioned recently that designs had been received by a committee for a canopy which it is proposed to erect over the statue of the late QUEEN at Winchester. Like all the works of Mr. A. GILBERT, R.A., it merits to be carefully preserved and properly placed. At present it is in the Abbey gardens; but the immense statue of King ALFRED, which is near it, has had an injurious effect. And, moreover, for a work which contains such delicate details, an unsheltered position in the open air is not advantageous. When it was completed the county hall was suggested to contain it. But there was opposition, and for a long time the beautiful statue remained covered with a tarpaulin in the Castle yard. It has now been arranged that a small committee shall take the subject into consideration and consult with the sculptor concerning the canopy and other matters. It will not be creditable if the least injury should arise to so important an example of English sculpture.

THE recent inquiry into the outlay on the Hammersmith Workhouse has been accepted as a lesson by the Local Government Board. For a while at least a more rigorous investigation of proposals will be adopted. A workhouse infirmary was proposed to be erected at Edmonton at a cost of 160,000*l.*, and the designs were sent about a month ago to the Local Government Board. The plans have been returned, but the deductions suggested are roughly estimated at from 50,000*l.* to 70,000*l.* The building was the subject of a competition, and therefore it may be concluded that without instructions to the contrary economy was recognised by the authors of all the plans. It is only when a designer has a free hand that avoidable expense prevails. To suppose then that a building of the kind could be produced for nearly one-half the amount estimated is suggestive of want of experience. Such a method of dealing with plans which have been carefully considered is likely to do more harm than good. It would be interesting to have a drawing which would represent the official standard, in order to compare it with the design approved by the Guardians. The Edmonton Union does not correspond with the metropolitan union; and those who administer the Poor Law are not under temptations like those which assail Guardians in the East End.

THE British Consul at Stockholm has sent to the Commercial Intelligence Branch of the Board of Trade a copy of the "program" issued with reference to a proposed bridge in the Swedish capital, for which designs and plans are invited. Prizes of 7,000 kr., 4,000 kr. and 300 kr. are offered. The bridge is an important one, owing to its situation as an approach to the new Houses of Parliament and to the State Bank; it is estimated to cost over 20,000*l.* Sketches, drawings, photographs, &c., to assist an architect in forming an idea of the place may be obtained from "Stockholms Stads-byggnadskontor" by paying 25 kr. Designs, in sealed envelopes, bearing a motto and marked "Tafnings-forslag till bro öfver Norrstrom," must be delivered to "Dratselmannens registrator, kansli, No. 2 Stora Nygatan, Stockholm, Sweden," not later than 3 P.M. on December 15, 1907. The designs must be accompanied by two envelopes bearing the competitor's motto, one containing his name (which is opened only in case the designs receive a prize or are purchased), and the other an address to which the designs are to be returned. The "program" may be seen at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

IN many of the guide-books to France, as well as in encyclopædias, the original name of Havre is said to be "Le Havre de Notre-Dame de Grace," and it was derived from a small chapel which stood on the site of the town of which FRANCIS I. was the founder. The British Consul-General, Mr. HEARN, gives a different interpretation of the title, and one which archæologists

will consider more prosaic. He says the flat, low-lying marshy land which was left by the Seine was known in the fourteenth century as the "Plaine de Grasse." The name was derived from the low Latin word "grassus," which signifies mouth, estuary, port or place where vessels can touch the low-lying land—land often inundated and always marshy—a creek or bight and narrow passage leading thereto from the sea. Thus the Haven of Grace actually takes its name from those features of the land which have been both an advantage and a disadvantage in its progress. The advantages lay in the creeks and fosses which have now become basins and docks, while the obstacles have made themselves apparent in the difficulty and expense in laying foundations in such fickle ground, and this has been particularly the case in building the great half-tide dock of the new harbour works. It is worth remarking that, according to some French authorities, FRANCIS I. wished to have the new port known as "Franciscopolis," but the name of the old chapel was too closely associated with the place to be superseded even by a royal command.

## ILLUSTRATIONS.

UNITED KINGDOM PROVIDENT INSTITUTION, STRAND, W.C.—  
DETAIL OF ENTRANCE.

THE site occupied by the new offices of the United Kingdom Provident Institution is not without interest, for on it stood the publishing office of the *Illustrated London News*. It stands at the angle formed by the junction of a narrow street and the Strand. It will be observed from the general view we published last week that a part of the building had to be set back in order to avoid interfering with the light of a shop in Milford Lane. The sculpture on the ground floor gives an important character to the building, and a strong contrast is offered between the vigorous seated figures and the standing figures in relief which flank the second-floor windows. In the interior, as will be seen from illustrations to be published subsequently, marble has been largely employed, and the principal rooms are most effective. The works were carried out by Messrs. HIGGS & HILL, under the direction of the architect, Mr. HENRY T. HARE.

TOWN HALL, LEIGH.

THE new town hall occupies a site of 1,882 square yards, with frontages to the market place, Market Street and Newton Street, Leigh. The two main fronts are in Darley Dale stone, and the building, both externally and internally, is designed in a Late Renaissance style. The main entrance has a projecting portico with grouped columns and carved capitals, with a richly moulded frieze and cornice. The large entrance hall is enriched with scagliola columns and pilasters. Spacious offices accommodate the various departments, and in each room is left space for future expansion. There are committee-rooms, a mayor's parlour and smoke-room, and a council chamber so arranged that three rooms can be thrown into one for occasions of public assemblies. Stained glass and heraldic devices are freely used. The whole of the work has been designed by Mr. J. C. PRESTWICH, of Leigh; the contractors were Messrs. ROBERT NEILL & SONS, of Manchester.

WESTMINSTER CATHEDRAL—CHAPEL, SS. AUGUSTINE AND GREGORY.

NEW PREMISES FOR THE ANGLO-EGYPTIAN BANK, TANTAH.

REREDOS IN CHAPEL, CONVENT OF ST. MARGARET, EAST GRINSTEAD.

THIS reredos, of which an illustration appeared last week, has been presented by an anonymous donor, and recently erected in the chapel. It is executed in oak with gilding on the carving and hollows of tracery. The work has been carried out by Mr. A. ROBINSON, of the Bloomsbury Carving Works, from the design of Mr. J. STANDEN ADKINS, of the firm of Messrs. JAS. BROOKS, SON & ADKINS. The illustration is from a photo by Mr. W. PAGE, of East Grinstead.

# HAM AND PETERSHAM.\*

PETERSHAM is a manor and village of very old standing, going back long before Domesday Book. It appears to have formed part of the original endowment of the convent of Chertsey, and is mentioned in the charter of the founders, Frithwald and Earkenwald, dated 666. It afterwards also mentioned in Domesday Book as being part of the possessions of the abbey of Chertsey. It so remained until 1415, when it was conveyed to Henry V. in exchange for some land at Ewell. In 1541 it was granted, with other estates, to Anne of Cleves, and she afterwards rendered it to Edward VI. In 1610 it was part of the estate settled on Henry, Prince of Wales, and shortly after his death it was settled on the king's second son, afterwards Charles I. In 1637 he granted the manor on lease to William Murray, afterwards created Baron Huntingtower and Earl of Dysart, and ultimately in 1666 the manor was granted to his eldest daughter and heiress and her husband Charles II. The earldom of Dysart was created in 1633, when the title was conferred on William Murray, the remainder to his heirs male and female. He had no sons, and his eldest daughter Elizabeth succeeded to the title. She obtained from Charles II. in 1670 a confirmation of her honours, with a clause in the charter allowing her to nominate any of her issue she pleased as her heir. She married Sir Lionel Tollemache, the descendant of an ancient family of Saxon origin, and had several children. He died in 1668, and in 1672 she married the Duke of Lauderdale, by whom she had no family. This was the gentleman depicted in Sir Walter Scott's "Old Mortality" as the president of the commission who tried the Covenanters after the battle of Bothwell Brigg. As a matter of fact, he was at Whitehall at the time, but he had acted in a similar way on former occasions, and the description Scott gives of him appears to have been well warranted by facts. The portraits of him in Ham House represent a man of a coarse, sensual and unscrupulous type. His duchess succeeded him, and died in 1697. She was succeeded in the earldom of Dysart by her eldest son by her first husband. Her eldest daughter married Archibald, first Duke of Argyle, and the Duke of Argyle immortalised in the pages of the "Heart of Midlothian" was born at Ham House. The title is peculiar, as it is in tail general, and not tail

by Hoppner, Sir Joshua Reynolds, Vandyke and Sir Godfrey Kneller. Adjoining is a small chapel, wainscotted, and here there is a prayer-book presented by Charles I. to the first earl, most handsomely bound, and with the royal arms worked on the covers in gold and silver filigree. In this chapel Lady Sudeley, the cousin of the present earl, was married. Near this chapel and close to the ground staircase is a small staircase in the thickness of the wall leading to a small room above, and is said to have been of value to fugitives in the time of the Commonwealth. Closely ad-

HAM HOUSE.

and passes to and through females as well as males in equal degree having the preference. It has been by several ladies in their own right; in fact, the present earl succeeded a lady, and presumptively will be succeeded by a lady. Ham House was built by Sir Thomas Vavasour about 1634, and that date, with the words *Vivat Rex*, are carved on the broken front door of the house. It was sold to the first Earl of Dysart in 1634. The house is built of red brick; the exterior presents no special features, and the rooms, with the exception of the great hall and picture gallery, are not very large proportions, but they are absolutely packed with treasures of art. The main hall is a large and lofty room paved with black and white marble, and having a gallery round the upper part. This hall contains full-length portraits of various members of the Dysart family

joining is the grand staircase, most beautifully carved in representations of ancient weapons. The rooms on this floor are mostly used by the family; the dining-room, instead of paper, has the old-fashioned Spanish leather hangings. In the breakfast-room is an original picture by Cuyp—a portrait of Sir Lionel Tollemache, who married the first countess, and a lovely picture by Correggio of *The Pentecost*. The walls are covered with tapestry said to have been made at Mortlake. There is a small adjoining room called the picture-closet, containing a large number of original miniatures and small portraits by some of the most eminent old masters; and here is preserved a small lock of the hair of Queen Elizabeth's Earl of Essex. On the upper floor are the State apartments, and here is the celebrated room called the "Cabal Room," from the meetings there of Charles II.'s Council, whose initials form the words Clifford, Arlington, Buckingham, Ashley and Lauderdale. This room and its furniture and ornaments are said to be in almost the same condition as when the Council met there. The floor is of parquetry, with the monogram "E.D.L.," surmounted by the ducal coronet. At the end there are two chairs, said to have been occupied by the Duke and Duchess of Lauderdale. The furniture in this room includes several magnificent cabinets, and there is here a portrait of the Duke and Duchess of Lauderdale by Sir Peter Lely. The mantelpiece is well worthy of attention, and also the old iron firebacks. As an example of the lavishness in furniture it may be mentioned that the very fire-irons are of wrought-iron and solid silver.

In the adjoining room are still preserved the chair used by the first Countess of Dysart and her walking staff. There is a magnificent Venetian mirror framed in silver, said to have belonged to Marie Antoinette.

On this same floor is the picture gallery, upwards of 80 feet in length, with portraits mostly by Vandyke and Sir Peter Lely, the most important being of Sir Lionel Tollemache, second Earl of Dysart, by Vandyke; Charles II., and the Duke of Lauderdale, both by Lely; Charles I. and Sir Harry Vane, both by Vandyke; Maitland, Mary Queen of Scots' Chancellor; Murray, first Earl of Dysart, and Elizabeth, his eldest daughter, the celebrated countess; Elizabeth, Duchess of Argyle, the mother of the celebrated

\*Read at a meeting of the Upper Norwood Athenæum on July 7, by Mr. George Thatcher.

duke, and others. There is also a miniature said to be of Elizabeth, Queen of Bohemia (Queen of Hearts), the eldest daughter of James I., though there is some doubt as to its authenticity. It will be remembered that it is through her our present royal family trace descent both from Tudors and Stuarts. There are a pair of Rose du Barry vases in this room said to be worth more than 3,000 guineas. There is also a very ancient jewel case, the lock of which is especially curious.

In another room not far from this is a second collection of miniatures, and here is a document of great interest to the antiquary, being none other than the charter fixing the division line of England and Scotland at the time of the Union.

The library contains a very large number of old books. There are no less than fourteen Caxtons and some of Wynkyn de Worde. There is also a large number of manuscripts, which, however, are not accessible at present.

There is a very large, old-fashioned garden of great extent, containing old English trees, shrubs and plants of all descriptions.

There was the pouting rose, both red and white,  
The flamy heart's-ease, flushed with purple light;  
Blush-hiding strawberry, sunny-coloured box,  
Hyacinth, handsome, with his clustering locks:  
The lady lily, looking gently down,  
Pure lavender to lay in bridal gown,  
The daisy, lovely on both sides, in short,  
All the sweet cups to which the bees resort,  
With plots of grass, and perfumed walks between  
Of sweetbriar, honeysuckle and jessamine.

Behind the garden extends the park, and here is the celebrated "Ham Walk," almost a mile long and terminating on Ham Common.

Separating the garden from this walk are the large iron gates, the tradition in respect of which is that they are only opened for an Earl of Dysart—and then only twice; first, when he brings home his bride and then when he departs on the last long journey from which there is no return. This, however, appears to be only a tradition and not to have any real foundation; the fact that the gates are never used probably gave rise to it.

Petersham Church is a small building dedicated to St. Peter and stands on a very old foundation, though the chancel appears to be the only part which is really old, and this dates back to the early part of the fifteenth century; traces of a Norman window on the north side of the chancel can be seen on the outside; the rest of the church was built in 1840, and is of red brick. There are several monuments well worthy of attention, particularly the altar tomb on the north side of the chancel, containing the full length recumbent statues of George Cole and Frances his wife. There are long Latin epitaphs from which it appears that he died in 1624 and his wife in 1633. Beneath in a recess is a small recumbent figure which represents Gregory Cole, a grandson of George Cole. There is a tablet opposite the pulpit to the memory of the discoverer Vancouver. The inscription runs as follows:—"In the cemetery adjoining this church were interred in the year 1798 the mortal remains of Captain George Vancouver, R.N., whose valuable and enterprising voyage of discovery in the North Pacific Ocean and round the world during twenty-five years of laborious survey added greatly to the geographical knowledge of his countrymen. To the memory of this celebrated navigator this monument is erected by the Hudson's Bay Company. March 1841."

There are many other monuments and tablets to various eminent persons which will repay examination.

The church plate comprises chalices, flagons and patens of silver, mostly presented by members of the Dysart family. The earlier church registers have been destroyed, but an entry has been preserved of the marriage of Prince Rupert with Frances Bard on July 30, 1664. She was the daughter of Sir Henry Bard, Viscount Bellamont in the peerage of Ireland. They had one son, Dudley Bard, who was known by his mother's surname; he was born in 1666, and killed at the siege of Breda in 1686. This register is especially interesting, as the fact that Prince Rupert was married has been generally doubted, and it seems pretty clear it was more or less kept secret. Rupert died in 1682. Had his son lived and had children who were Protestants, interesting questions might have arisen about this entry of marriage, as it will be remembered that our present royal family claim title to the throne through the Electress Sophia, the

youngest daughter of Rupert's mother, the eldest daughter of James I., she being declared the nearest Protestant succession.

Petersham itself seems to have altered very little from what it must have been in the past, and still preserves a quiet, peaceful, rural state, far different from Twickenham, its busy neighbour opposite, with its railways, electric lights, electric tramcars, busy streets and large shops. The river seems a division of 200 years. I think all will agree that, although there may be far more magnificent scenery nothing can excel the quiet beauty of the Thames Valley. Here let me quote a passage from one of our great masters describing this spot or the immediate neighbourhood:—

"The carriage rolled rapidly onwards through fertile meadows, ornamented with splendid old oaks, and catching occasionally a glance of the majestic mirror of a broad placid river. After passing through a pleasant village, the equipage stopped on a commanding eminence where the beauty of English landscape was displayed in its utmost

HAM HOUSE—PRINCIPAL ENTRANCE.

luxuriance. Here the duke alighted and desired Jeanie to follow him. They paused for a moment on the brow of the hill, to gaze on the unrivalled landscape which it presented. A huge sea of verdure, with crossing and intersecting montories of massive and tufted groves, was tenanted by numberless flocks and herds, which seemed to wait unrestrained and unbounded through the rich pastures. The Thames, here turreted with villas and there garlanded with forests, moved on slowly and placidly, like the might monarch of the scene, to whom all its other beauties were but accessories, and bore on its bosom a hundred barks and skiffs, whose white sails and gaily fluttering pennants gave life to the whole."

In conclusion, I should like to quote the following lines:—

My eye, descending from the Hill, surveys  
Where Thames amongst the wanton valleys strays—  
Thames, the most loved of all the ocean sons  
By his old sire, to his embrace runs,  
Hasting to pay his tribute to the sea,  
Like mortal life to meet eternity.  
Oh! could I flow like thee, and make thy stream  
My great example, as it is my theme—  
Though deep yet clear, though gentle yet not dull,  
Strong without rage, without o'erflowing full.

The Sheffield Corporation is considering the desirability of establishing municipal links either in one of the parks or on one of the large estates of the water committee, as gathering ground for the reservoirs. Several meetings have been played by members of the Sheffield Corporation against members of the Rotherham Corporation.

# BYZANTINE DOOR TREATMENT.\*

THE earliest of the bronze doors which still exist in the south of Italy were importations from Constantinople, beginning with those of the cathedral, Amalfi, which are seen in their present position by Desiderius in 1062, then to the church by Count Pantaleone. Members of his family gave those at Atrani, St. Paolo fuori, Rome, of which only a few poor remains escaped the fire, Monte St. Angelo and Monte Cassino, the last-named being practically unaltered. In these doors the figures are incised on the bronze, and the lines filled either with silver or with a gilded mastic, and some of the panels have crosses chased applied to the surface which bear great resemblance to others nearly contemporary at Sta Sophia, Constantinople. The doors of the cathedral, Salerno, given in 1099 by Landolfo-Butromilo and his wife, are similar, and at St. Mark's, Venice, is a pair of doors of the same type brought from Constantinople, and another pair made in the twelfth century in that city in imitation of them. These doors are all inscribed, so that there can be no mistake as to the time and place of their manufacture. At Salerno are two very fine doors made by Oderisius of Benevento in 1119 and 1127, which combine the Byzantine technique with a feeling for grotesque and relief work, and engraved patterns of a western type; and at Canosa two remarkable doors made by Roger of Amalfi about 1150, on which the applied flat ornament is quite Saracenic, and some of the figures were executed in the usual Byzantine manner, and others cast and applied. Amalfi had a flourishing commerce in the early medieval period. While in Salerno Arab science came into contact with Christian and that of the West, Amalfi was the centre of exchange for Eastern and Western merchandise. The Arabs brought thither Oriental manufactures and received in exchange Western products; and the Amalfitans carried Western manufactures to the maritime cities of North Africa and Syria. They also had relations with the Greek ports, bringing especially the purple robes which the Greek nobility used to wear. It became the chief emporium of the silks of Greece. Amalfitans were established in Constantinople, Sicily and other places. Beautiful marble ambroses of the twelfth century, of which this at Salerno is an example, are the product of this mingling of Oriental influences with the Lombard. It was in the reign of Romuald, the Salernitan bishop and councillor to William I. and II. of Sicily, who spent a great part of his life in Palermo, and, no doubt, employed Saracen workmen to fulfil his commission, though the sculpture of the Easter gospels especially shows the chisel of a Campanian sculptor. The fine doors at Benevento, of about 1150, show Byzantine influence in the design of the subjects and many of the architectural details, but combined with a sense of nature and a variety in the arrangement of poses which at first sight seem alike, and show that the design was not an affair of carrying out a recipe. The doors made by Bonannus of Pisa and Barisano of Trani, which stand near each other in the cathedral of Monreale, show considerable feeling for relief. In the west doors at Trani and Ravello, Barisano employed the same moulds as Monreale with somewhat different surroundings, basing himself on his models on the panels of the Byzantine ivory caskets, on which figures of warriors fighting, &c., are carved. The ornament between the panels is also quite original in its suggestion frequently, and this detail from the door at Ravello shows how the various pieces were joined. He was a commercial craftsman, and thought of repeating the same panel over and over again in the same door; indeed, both in this door and in that at Trani the two leaves are repetitions of each other, and the figures of the panels at the top of the door (which is square-headed) shows that it was originally designed for one which was within an arch—the door at Trani, in fact. Bonannus did not mind repeating the general arrangement of his design and that at Monreale is very like that at Pisa, with the exception, of course, for Pisa must have been the original with a square head and long panels at top and bottom. At Monreale the top panel is hidden by the arch. In 1891 Graeven made a curious discovery at Pesaro of an archway of Adam and Eve being driven out of Paradise, which is identical with some little figures on Bonannus's door at Pisa, and which makes it certain that ivories were used as models by the Italian bronze workers, and by

further discoveries has shown that the ivory workers sometimes copied miniatures. He found in the Museum at South Kensington a panel with two ends added to a central portion. The centre was the reproduction of a miniature from the Joshua roll in the Vatican Library, a MS. of about 500, while two figures on the piece added to the right were taken from another miniature in the same roll. One of the panels of the cover of the Psalter of Charles the Bald and a panel in the Zurich Museum also show the use of miniatures as copies, in this case from the Utrecht Psalter, and the cover of the Veroli casket he shows to have been put together from various classical sculptures and mosaics, specially the Europa corner from a mosaic found at Pales-trina and now in the Barberini collection at Rome.

The northern tradition is seen in the doors of S. Zeno, Verona, which were probably originally made in Saxony and show great resemblance to work at Hildesheim, Augsburg and Nijni Novgorod, at which last-named place there are doors which came from Magdeburg. These doors of S. Zeno were burnt in 1160 and restored, and additions by a third hand, probably a local craftsman, may be recognised. The piercings in the dividing rolls are probably a reminiscence of the cloisonné glass and garnetwork which the early Goths practised—the plate prepared for the jewels. The German influence in this part of Lombardy was very strong; it was reunited to the empire by Otho I., and in the lists of monks and nuns on the various religious foundations names of German or Lombard derivation are far more numerous than Italian names.

Architectural ornament, both painted and carved, appears generally to have developed in accordance with the progress in the Scriptoria, though it is questionable in some cases whether the design of the goldsmiths' work influenced that of the MSS. or whether the reverse was the case. At any rate details of ornament which appear in architectural decoration in the twelfth century are to be found both drawn and worked in metal at an earlier date. At Reichenau and Ratisbon were schools of illuminators whose designs were used for wall-paintings, and in the MSS. the ornamental details show the plan of Romanesque scrolls, with Byzantine forms in the accessories of the miniatures with Lombard interlacings, and in one case at least with a development of Syrian carved patterns of the sixth century. The north door of the cathedral of Basle, 1010-19 (to which Henry II. presented the fine antependium now in the Musée Cluny), shows ornament which has Eastern suggestion though obscured by restoration. In Frederic Barbarossa's castle at Gelnhausen the Oriental suggestion is stronger, the general form of the caps bearing a likeness to Saracenic shapes (as we have found also at Le Puy), coupled with the Byzantine super-abacus elaborately carved. Similar arcades to this one occur at Schloss Münzenberg, Goslar, the Wartburg (which is perhaps the finest example, having several storeys), Wimpfen, Seligenstadt and in other castles. Frederic went with his uncle Conrad to the crusades in 1147-8, and perhaps this may account for the character of the ornament to some extent. The date is 1170, and there is a curious difference between the extreme richness and elaboration of the ornament of the archivolt of the door to the great hall and the simplicity of that applied to the fireplace. At each side is a carved panel—one has an interwoven pattern met with in Rome in the sixth century, and the other a well-known ninth-century pattern of interlacings. The arch of a window opening above and the shafts of the fireplace have a simple zigzag and chevron, and if the two panels were not of the local stone one would suppose that they had been imported in the same manner as Charlemagne imported marbles for his palace at Aachen. On one of the capitals the imperial eagle appears, but it is doubtful whether it has any heraldic signification, for capitals almost precisely similar occur at Toulouse and in other places where there could be no question of imperial rule. The little town has a very fine church of rather a later date, probably about 1220, but the carving retains the Romanesque patterns in the elaborate ornaments of the jambs and archivols, and gives a very good idea of the richness of the later Romanesque. Here you may still observe an inferiority in the treatment of the figurework to that of the ornament, and a certain stiffness of pose, though it is a great advance upon the earlier Romanesque figure sculpture; but the carving of the ornament is excellent, and indeed has been styled "unsurpassable" by a German art historian.

The cathedral of Bamberg in its present state dates from the twelfth and thirteenth centuries; the western choir was finished in 1274, a consecration is recorded in

\* From the Cantor Lectures by Mr. F. Hamilton Jackson, vice-president of the Society of Decorative Designers, given in the *Journal of the Society of Arts*.

1237 and an earlier one in 1111. To the earlier building the doors at the eastern ends of the aisles belong, one of which has a very beautiful range of capitals with half-lengths of saints, forming a kind of super-abaci. The other has had figures attached to the columns in imitation of the French portals at a later date; and the fine door on the north with similar figures and a Doom in the tympanum is also of this period, several of the figures being evidently carved by the same sculptor. The grimacing figures, by another hand, show that the French influence had not been fully absorbed, though the capitals are many of them quite excellent in design but no longer distinctively German in character.

It has been claimed by some German writers that the Romanesque style was firmly established in Lower Saxony in the second half of the tenth century. If that is so, it can only have been as simple construction, for after the Ottoman impulse was exhausted the level of carving was very low until the end of the eleventh century. Many of the examples have been dated too early, and the latest German opinion appears to be that the carving on the Holy Grave chapel at Gernrode, some tombs of abbesses and other carvings in the Schlosskirche at Quedlinberg, and the figures on the parapet of the west gallery at Kloster Groningen are the earliest examples extant. These are all of the twelfth century. A good deal of beautiful archaistic work was done in stucco, at Hildesheim, Halberstadt and Hecklingen, for instance, with which the figures at Cividale may be compared, which are probably of the same century. The influence of Byzantine ivories is evident in the casting of the draperies, an influence which is even more noticeable in the Christ of the fine tympanum of St. Godehard, Hildesheim, of the end of the century. Herr Goldschmidt has published a photograph of this figure side by side with an enlargement of a Byzantine ivory which proves the influence incontestably. This is before the French influence appears, the earliest certain instance of which is in the choir of Magdeburg, where a craftsman who had worked in France commenced working between 1210 and 1220.

Although the most important factor in the making of Romanesque ornament has been proved to be motifs of Oriental origin, modified by local peculiarities and Lombard tradition, the influence of the antique must not be left out of consideration, though its strength varies greatly in different districts. We have seen, for instance, how much the ornament of the south of France was affected by the remains of antiquity still extant there, and at Modena the carving of Willigelmus on the façade of the cathedral shows classical details in the moulding, and even absolute copies of a winged genius with reversed torch used as decorative panels; but around Spalato a school arose in the twelfth century which based its ornament so closely on the imitation of classical details that the buildings upon which they appear have been held to be entirely antique, though it is only certain portions of them which are so. The door of S. Salvatore in Crocefisso, now the chapel of the cemetery, for instance, and the tympanum of the Temple of Clitumnus, a few miles away, both have the cross interwoven with their ornament in a manner which shows that they are not of Pagan origin—though in each case considerable portions of the building behind are antique and the character of the carving in accordance. The church of St. Pietro, Spalato, has older reliefs worked into the ornament of its façade with bestial subjects, but is work of the end of the twelfth century. Yet the patterns carved upon the jambs of the central door are so antique in style that it is only the perfect fitting of the ornament to the space which it fills which makes it certain that it was carved for its place. An enlarged detail will show this character more clearly. Now it is a very curious fact that this pattern is almost exactly like the jamb of a door of the Syrian second-century church of Kanawât, figured in the report of the American archæological mission to Syria; and it is strange and inexplicable that two sculptors so far away from each other should hit upon the same treatment of much the same details. Observe also that the rosette patterns of inlay are most of them Oriental. At Narni the doors of Sta Maria Impensole are surrounded by similar ornament which is plainly the work of the same school, the principal of which, the main door of the cathedral, Spalato, is signed by Melioranzo, who perhaps was the founder. At Verona, too, classical details are frequent. The arcaded cornice of the font in St. Giovanni has among the heads which serve as corbels a Jupiter Ammon with ram's horns, a Midas with ass's ears and a head of Zeus. And at Pisa the pillars at the sides of the central door of

the western façade are covered with elaborate arabesques, which are so antique in feeling that they too have been claimed as antique fragments though the proportions of the columns are not antique, and the corresponding columns of the door of the baptistery are worked with equally beautiful arabesques, the work of Diotisalvi in 1153, while Giovanni Bigarelli of Como's font in the centre shows a combination of inlay of coloured marbles mixed with foliage, in which the antique influence is often very visible, though the design on the lintels is inspired by Byzantine ivories. At the cathedral of Lucca are other columns with beautiful arabesques based upon classical data, and in the cloister of Monreale, Sicily, one of the most beautiful features is the groups of four colonnettes at each corner carved with similar arabesques.

Again, the scrolls of ornament on the doors of the cathedral, Zara, are based on classical forms, though directly, and they bear great resemblance to those used by Benedetto degli Antelmi on the archivolts of the door of the Baptistery at Parma, and a still closer resemblance to the ornament on the font within. At Borgo San Donnino he used the same kind of details, which themselves are like the carving directly derived from antique models which we have seen at Arles and St. Gilles, and make it probable that certain Benedetto had lived and worked in the south of France. Certain details of costume (such as the curule chair, which is also found on a terra-cotta dug up at Afridi near Samarcand) and ornament occur in France, and not all in Italy at any earlier period. His most evident use of the antique is in a figure of a griffin, which is taken almost line for line from a well known antique, but vivified.

It was probably from the sarcophagi that the arcaded patterns with figures or ornament beneath them, which occur as part of Romanesque decoration, originated. Such compositions, as that from the western façade of the cathedral at Modena, in which subjects from the history of Adam and his fall fill a series of arched spaces, and form a decoration of the either side of the main doorway, are not infrequent. At Verona, the arched spaces contain a greater variety of subjects, in four rows, each beneath a single arch, ranging from the Creation to the legendary death of Theodoric. The patterns on the bands between, evidently of classical origin, and in the columns of the high altar of St. Mark's, Venice, probably brought from Sta Maria in Canneto, Pola, and dating from the fifth century, a whole series of Scriptural subjects is treated in this manner, one figure generally tenanted each niche, which make them rather difficult to comprehend when many figures are required for the expression of the subject. This rather inconvenient method of rendering scriptural and legendary subjects was sometimes used at a later date; the similar pillars at the base of the canopy at San Marco are of the eleventh century, though very inferior in workmanship to those which they imitate; and in the courtyard of the archbishop's palace at Verona is a column of a later period, as the trefoiled arches show, carved with scrolls with very decorative effect, but was in fact the decorative effect which was sought rather than the effective presentment of the subjects: in the arcadings ornament is often found in place of figures, as in the well-known well-head from St. Samuele, Venice, in which the Byzantine character of the ornament is so pronounced.

#### TESTING SLATE.

A SPECIAL number of the American publication *Stone*, published by Mr. A. Lent, New York, is devoted to the important subject of slate, and contains several articles on various phases of the industry. The following paper is taken from the nineteenth annual report of the United States Geological Survey, and has also been issued as a bulletin. It will suggest the practical character of *Stone*.

Methods of testing the elasticity, absorption, fissility, and resistance of roofing slates have been in use for many years, and many more or less complete chemical analyses of slate have been published. In recent years, however, more exact methods of reaching these results have been devised. All such methods have here been brought together. If parts of one specimen, fairly representing the average quality of the product of any quarry, or if parts of each of a series of specimens, representing all the different varieties and qualities obtained, were to be subjected respectively to the tests described, such a slate or slates may be said to have been for all economic purposes exhaustively investigated. Several of these tests are of so simple a character as to be

easily applied. This list of methods is largely compiled from Böttinger, Fresenius, Hutchins, Jannetaz, Merriman, Reverdin and De la Harpe, Sorby, Umlauf and J. F. Williams. Although they all offer valuable suggestions, the most useful papers on the subject are those of Fresenius, Umlauf and Merriman.

**Sonorousness.**—One of the first and most time-honoured tests of roofing slate is to suspend a good-sized piece of the usual thickness and tap it with some hard object. If it possesses the molecular structure of a slate it will yield what might be termed a semimetallic or semivitreous ring. It is because of this property that when at the quarries refuse slates are thrown upon the dumps the sound produced is not unlike that made by the smashing of a large quantity of crockery.

**Cleavability.**—This test should be applied by an experienced workman. The block should be freshly quarried, unfrozen and moist. The chisel should be very thin and about 2 inches wide. The cost of slate is closely related to the degree of its cleavability.

**Cross Fracture ("Sculping").**—This is to determine the character of the "grain." This test should also be applied by an experienced hand to a large block several inches thick with a stout chisel and a long-handled, heavy mallet. Jannetaz published a method for determining with scientific precision the direction of the grain in slate when it is but obscurely shown on the cleavage surface. The slate is sawed in a direction parallel to its cleavage, and one of the sawed surfaces is made exceeding smooth and covered with an even and very thin coat of grease. The point of a red-hot platinum wire is applied to the slate opposite the centre of the greased surface. The greased surface reached by the heat will, in cooling, leave an oval outline, the long axis of which will show the direction of the grain, the heat having travelled more rapidly within the slate in the direction of the grain than in any other. He also made a disc of slate 4 inches in diameter of ordinary thickness, with a central perforation. This disc was fastened by the extremities of the diameter parallel to the grain and afterwards by that at right angles to the grain, and was made to vibrate by tapping the sides of the perforation. The sound produced when the disc was fastened by the diameter at right angles to the grain was louder than when fastened by that parallel to it. In other words, the direction of the grain was that in which elasticity and vibration were greatest.

**Character of Cleavage Surface.**—The cleavage surface should be examined with an ordinary magnifying glass. A superior slate should scale along the cleavage surface into very thin chips with translucent edges. If the grain is pronounced it will appear in fine transverse lines. If false cleavage, which is fatal, be present, it can usually be detected on the cleavage surface. Ribbons, which are sometimes lines of weakness, should be noted. There is a great difference in the smoothness of the surface in slates of different regions. Ordinarily the constituent minerals ought not to be visible. Minute lenses or crystals are not necessarily detrimental, but they retain dust and thus afford a foothold for mosses and other cryptogams, which render moisture and thus aid the decomposition of the slate.

**Presence of Lime.**—This can be determined by the application of cold dilute hydrochloric acid to the edges of a freshly quarried slate. Rapid effervescence implies presence of carbonate of lime; slow, that of a lesser quantity of it or dolomite—carbonate of lime and magnesia.

**Colour and Discoloration.**—The colour of the freshly quarried slate should be noted and compared with that of slates exposed for several years to the weather, either on the quarry dumps, or with that at the top of the quarry close to the gravel, although this last comparison is not always so perfectly conclusive. The value of slates is somewhat affected by the extent of their discoloration.

**Presence of Clay.**—This should be tested by breathing on a fresh and clean piece of slate and observing whether there is any argillaceous odour. The very best slate will emit any such odour.

**Presence of Marcasite.**—A slate containing lenses or streaks of a pale yellowish metallic mineral which on exposure decomposes, forming a yellowish white film and spots, is poor.

**Strength.**—Merriman finds the modulus of rupture in the best slates should range from 7,000 to 10,000 lbs. per square inch. J. F. Williams shows a limit of compressive strength ranging from 8,040 to 24,760 lbs. per square inch and a tensile limit at from 4,850 to 10,260 lbs. in the purple,

red and green slates from Rutland and Washington counties. Campbell and Donald give 20,000 lbs. as the crushing weight for 1 cubic inch of slate. Wilkinson, in his "Practical Geology of Ireland," gives 30,730 lbs. as the crushing weight of the Killaloe slates. Watrin gives the maximum crushing weight of some French slates as 2,000 kilogrammes per square centimetre, but 1,700 as the average.

**Toughness or Elasticity.**—Merriman finds the ultimate deflection in certain Pennsylvania slates, when placed on supports 22 inches apart, to range from 0.270 to 0.213 inch. Certain blue-black slates in Eldorado County, California, when split seven to the inch and 18 inches square, and fastened solidly at the two ends, are said to bend 3 inches in the centre without any sign of fracture. J. F. Williams tested beams of slate from Rutland and Washington counties, 1 inch square and 10 inches long, with supports 6 inches apart. Bending without breaking was effected by from 770 to 1,200 lbs., and when the supports were placed 3 inches apart by from 1,710 to 2,400 lbs. The great elasticity of the slates of eastern New York and western Vermont is apparent to any one visiting the shanties where the splitting is done.

**Density or Specific Gravity.**—This is determined in the usual way, by weighing a piece of the slate in and out of water and dividing its weight out by the difference between its weight in and out. The specific gravity will be considerably affected by the amount of magnetite or pyrite. Merriman's tests of Pennsylvania slates give 2.761 to 2.817. Meyer's "Konversations-Lexikon," 1894, gives 2.8 to 2.9 as the normal specific gravity of a good roofing slate.

**Porosity.**—This is best determined by drying, then weighing, then immersing for twenty-four hours and weighing again, in order to ascertain the percentage of water absorbed. Merriman takes a piece 3 by 4 inches, with rough edges, dries it in an oven at 135 degs. Fahr. for twenty-four hours, cools to the normal temperature of room, weighs and immerses it for twenty-four hours and weighs again. His tests of Pennsylvania slates showed from 0.099 to 0.303 per cent. of absorption. Porosity is sometimes roughly indicated by immersing a roofing slate edgewise one-half in water and observing how far the water ascends by capillary attraction. In good slates it ought to rise but very little.

Reverdin and De la Harpe state that slates are liable to deterioration from the chemical action of gases arising from woodwork beneath the slate, as well as from the action of the atmosphere, and that they are also liable to an increase of porosity by the physical action of changes of temperature and by the unequal conductivity of heat in the direction of cleavage and of grain. They state that the porosity in a fresh slate should be below 0.1 per cent., and after treatment less than 0.2 per cent. Their somewhat elaborate method is this:—For determining porosity as produced by acids the slate is treated with 10 per cent. cold acetic acid, and the flask is made vacuum from time to time. The piece is then washed, dried, weighed and immersed in diphenylamine in a thick-walled tube 12 by 3½ centimetres. The tube is exhausted, heated two hours in oil bath at 170 degs. Centigrade, air pressure is restored, and heating continued for four to five hours at 150 degs. Centigrade, after which the test pieces are removed, the diphenylamine wiped off with ether and the increase in weight taken.

For determining porosity as produced by changes of temperature the slate is heated in a wrought-iron tube for half an hour to 300 degs. Centigrade, and the tube is then suddenly cooled by a stream of water for half an hour. This process is repeated twenty-four times, and the slate is then impregnated with diphenylamine and the procedure is as in previous test.

Fresenius is accredited with a method of testing the effect of heat and cold on slate by saturating it with water and putting it for twenty-four hours in a freezing mixture and heating another from 250 degs. to 350 degs. for five or six hours and then immersing it in water. The porosity, strength and elasticity of the pieces so treated should then be tested. Böttinger points out that the greater the porosity of a slate the more damaging is the action of frost likely to be.

**Corrodibility.**—An important quality in roofing slates is their resistance to the acids of the atmosphere, particularly in cities, where gases increase its destructive power. Fresenius in 1868 suggested testing the weathering qualities of a slate by immersing it for three days in dilute sulphurous acid in a closed vessel. At the end of that time poor slates are softened or broken up into thin laminæ or easily fractured, while good ones preserve both their density and hardness.

Merriman, for the same purpose, prepared a solution consisting of 98 parts of water, 1 part of hydrochloric acid and 1 part of sulphuric acid. Pieces of slate 3 by 4 inches were carefully weighed, then immersed in the solution for sixty-three hours, then dried for two hours in the air of the laboratory and weighed again. The loss in weight ranged from 0.374 to 0.619 per cent.

**Microscopic Analysis.**—One of the most satisfactory tests of slate is the examination of a thin section of it under the microscope. A cubic inch thus tested will suffice to show the character of the cleavage, the presence of false cleavage, if any, the probable durability or indurability of the colour, as well as the presence of any mineral constituents likely to affect its general durability. The specimen should be carefully selected so as to fairly represent the general quality of the bed. It should be fresh, unfrozen and about an inch thick across the cleavage. At least two sections should be prepared—although the more the better—one parallel to the cleavage and another at right angles to it, never diagonal to it. The sections should be exceedingly thin, much more so than ordinary sections of eruptive rocks, and the slide-cover should be of the very thinnest kind to admit the use of the highest objectives. Both slides should be examined first in ordinary light, then in polarised light with powers ranging from 140 to 700 diameters. The transverse section will show the quality of cleavage, the false cleavage if any, and, under polarised light, will, as pointed out by Sorby and others, show whether the specimen is a slate or a shale or something between the two by the entire matrix becoming in a true slate four times dark and four times light in complete rotation. Sections parallel to the cleavage reveal the amount of carbonate and indicate the probable amount of discoloration by exposure. Both sections under incident light will show pyrite if any exists.

**Chemical Analysis.**—This, in order to give a correct idea of the composition of the slate, should not be partial but complete. Such an analysis should then be compared with complete analyses of the best slates of like colour, and before a final conclusion is reached as to the value of the slate its microscopic analysis and the results of the tests of its strength, elasticity, porosity and corrodibility should be considered in connection with its chemical analysis. Merriman concludes from six different kinds of tests applied to each of twenty-four specimens of old Bangor and Albion (Pennsylvania) slates, as well as from the results of several general chemical analyses, that:—

"The strongest slate stands highest in weathering qualities, so that a flexural test affords an excellent index of all its properties, particularly if the ultimate deflection and the manner of rupture be noted. The strongest and best slate has the highest percentage of silicates of iron and alumina, but is not necessarily the lowest in carbonates of lime and magnesia. Chemical analyses give only imperfect conclusions regarding the weathering qualities of slates, and do not satisfactorily explain their physical properties."

Reverdin and De la Harpe also call attention to the fact that good slate may have a high percentage of calcium carbonate, and that others free from it may be poor, and that the presence of pyrite is not necessarily a bad indication, for it may not decompose. This statement needs modification, however, by adding that marcasite even in small quantities is very deleterious, for it decomposes very readily.

Besides these tests, there are a few others which are of scientific rather than economic importance. Umlauf suggests heating small splinters of slate under the blowpipe to determine the presence of pyrite and carbon and to ascertain the relative fusibility of different slates; also the test with bead of borax or phosphate of soda and ammonia to determine the presence of iron. He recommends putting a splinter of slate in pure hydrochloric acid in a watch glass, and after evaporation examining the precipitate microscopically; also the application of the same treatment to a splinter after fusion with the blowpipe. He recommends also the application of the ordinary mineralogical tests for hardness, e.g. scratching the slate with calcite and fluorite.

Hutchins finds that the presence of chlorite minerals can be detected by heating the slate to dull redness, thus dehydrating and discolouring those minerals, then preparing a thin section of the slate so treated and comparing it with sections of the normal rock.

**The Third International Congress** for the development of drawing and art teaching is to be held in London during August 1908. The two preceding congresses have been held at Paris and Berne.

## THE NATIONAL GALLERY.

THE following pictures have lately been added to the National Gallery:—

"Une Parade," by Gabriel de Saint-Aubin, No. 2,129, hung in Room XVII., bought from the Lewis Fund.

"The Water Lane," by Jan Siberechts, No. 2,130, presented by Mr. J. P. Heseltine, hung in Room XIII.

"Roses," No. 2,133, and "Apples," No. 2,134, by Henri Fantin Latour, and a sketch of "The Marsh of Arleux," by J. B. Corot, No. 2,135, all bequeathed by the late Mr. Edwin Edwards and hung in Room XVII.

A small engraved portrait of Lully, the musician, by Auguste de Saint-Aubin, No. 2,136, illustrating the picture by Rigaud, No. 2,081, presented by the Comtesse de Coullanges, hung in Room XVI.

Besides the above permanent additions to the Gallery at Trafalgar Square, Sir Hickman Bacon has lent his "Tavern Scene," by Adrian Brouwer, placed in Room XIII. and Sir George Donaldson has lent his portrait of "Bona Savoy," by Ambrogio de Predis, which has been placed in Room IV.

The following two pictures have been added to the collection of British pictures at the Tate Gallery:—

"The Picnic," by Sir David Wilkie, No. 2,131, presented by Sir Charles Robinson through the National Art Collections Fund, hung in Room I.; and a portrait of Mr. Morris Moore by Alfred Stevens, No. 2,132, presented through the National Art Collections Fund by Mr. J. Duveen, Mr. Sargent R.A., Mr. Herbert Cooke, Mr. A. MacNicol, Mr. A. A. Pass and other donors, hung in Room III.

## PERCENTAGE IN AMERICA.

THE following letters from architects relating to the schedule of charges of the American Institute have appeared in *The Inland Architect*:—

Boston: July 3, 1907.

I personally feel on the whole satisfied with the present schedule of the A.I.A. The system of basing the charges of architects for professional service upon the cost of the building is not an ideal one, and in many cases the architect under it is much overpaid and in many more he is not paid enough, but a person with fairly even practice need not have any cause to complain very seriously if the details of his business are properly attended to. We would all favour of course a system by which the architect would be paid an amount based upon the time he gives to the work, upon his own experience and the magnitude of the work itself, quite irrespective of what the builder may charge for carrying out the work, but I am afraid any such scheme as this would be too much to hope for under existing business conditions.—Yours very truly,

C. H. BLACKALL.

Boston: July 1, 1907.

The commission basis I consider radically wrong. The cost of the architect's services bears no relation to the cost of the building except on buildings of the same kind and character. Compare the draughting and the personal service of the architect on a house worth 200,000 dols. with the draughting and personal service necessary for a school costing 200,000 dols., having twenty-five or thirty large rooms identical in every respect. It is undesirable that the architect should have a financial interest in the cost of the work. If he is extravagant his compensation is greater. If he is careful and economical he will spend more time and money in effecting savings for his client, merely to be paid less himself. Various remedies have been suggested.

1. That the client be charged on the basis of cost of draughting, this being multiplied by three or four to cover cost of office expenses and the proper profit.

2. That the client pay a fixed sum for the architect's fee and in addition the actual cost of doing the work. The first leaves the client at sea as to what he must eventually pay and might make the architect careless as to his salary list. The second is open in part to the same objection, but either case the architect might be willing to fix a limit to his cost. His fee might be based on the old commission basis as e.g. 2½ per cent. of the estimated cost, and not to be altered by actual cost. Cost of draughting being rendered monthly could be checked by the client, and if it were costing too much, less expensive men could be put on it. A fair way to arrive at the office expense chargeable to each job appears to be to divide total office expense *pro rata* according to the

me spent on the draughting irrespective of the salary of the man, as the low salary man takes as much office room and uses as much material as the high man. These various suggestions have come to me from different men; they are not my own ideas. They seem to me practicable and on the right line, and in practice work well.—Yours very truly,  
R. CLIPSTON STURGIS.

Baltimore: July 2, 1907.

We, as a firm, do consider that the present rate of commission to architects, according to the A.I.A., is too low to adequately pay for the work required, and particularly so for all contracts under 10,000 dols. We also think there may be a more appropriate and just method of payment to architects for services rendered than a percentage on amount of contract, as, in a very large number of instances, the architects' services cannot be justly rated, in the various lines on which their work must be done, by a simple rate of percentage on the cost of the work to the owner. While we think that very possibly some other method might be established for the just payment of architects' fees than by schedule arranged by the A.I.A., we are not at present willing to state that this is our positive opinion, nor to suggest what such changed methods might be without giving the subject deeper consideration than we have yet been able to do.—Very truly yours,

WYATT & NOLTING.

Richmond, Va.: June 28, 1907.

The schedule of charges as fixed by the A.I.A. has been in vogue for years, and is generally used, certainly by all architects in good standing in their practice. This schedule is generally known and understood by the public, and they are satisfied with its requirements as to charges, &c., recognising as they do the standing and influence in the arts of the A.I.A. It has required some years for this to be understood and appreciated, and now to abolish or change it would, in my opinion, be a mistake. This schedule is headed, "The Proper Minimum Charges, &c.," and the architect, where he thinks he would not be properly paid for his services, can increase such charges by a special agreement with his client before the work is done; and he is authorised by the schedule to make a special rate in excess of the 5 per cent. where the building costs less than 100 dols. To abolish or change the schedule by increasing fees would reopen a matter which is now fixed and recognised, and would lead to complications and allow a decrease in the regular rates by some and an increase by others. I have adhered to the A.I.A. schedule in my practice of many years.—Very truly yours,

M. J. DIMMOCK.

Philadelphia: July 1, 1907.

We have just written a letter to a special committee of Philadelphia Chapter, American Institute of Architects, on the subject of professional fees, which covers our views, so we quote from it as follows:—

In our judgment the present minimum rate of 5 per cent. on the cost of general construction with an additional 10 per cent. on the cost of mechanical work where the services of mechanical experts are required, and 10 per cent. on the cost of furniture and fixtures designed or selected, is efficient and satisfactory compensation for all work of considerable size. Residence work, alterations, monumental work and work of special character generally cannot be done profitably except by charging a considerably higher fee, which should be a matter for each office to determine for itself as may suit its policy or the circumstances of each individual case.

Certain classes of factory work, storehouses and work of a nature that can be done profitably on a 3½ per cent. commission to be computed on the total cost of the work and the owner to pay for the services of mechanical experts. In the latter work we make a distinction between the mechanical work which forms part of the building, such as heating, lighting and elevators, and the work in case the building is a factory. The latter is generally included in the architect's work.

A 10 per cent. charge for furniture and fixtures in a building of any considerable size is an equitable one if fully understood and arranged between the client and architects. Although the cost of designing elaborate buildings may perhaps exceed the commission received, the difference is made up by the greater profits on the materials and the various fixtures, which are largely matters of selection and call for discriminating taste rather than for saving in labour and time.

"Our feeling is that the minimum rates should be confined to the work first described above. While small houses, country residences, alterations and work of that nature cannot be done by the ordinary office at the minimum rate, it is reasonably profitable to the young architect who does most, if not all, of the work himself, and it would be an injustice to deprive him of the opportunity to do such work in a self-respecting manner by establishing a greater minimum charge for it and telling him he must not do it for less. This does not mean that the larger offices should not charge larger fees for such work; on the contrary, they should, so that the client who desires to build a small house or do any of the work coming within the above classification can decide for himself whether he will employ the young man at 5 per cent. or whether he will avail himself of the larger organisation and perhaps greater experience of the better known offices by paying the difference."—Very truly yours,

RANKIN, KELLOGG & CRANE.

#### School Hygiene.

SIR,—As a slightly incorrect statement was published, it would be as well to explain in some detail the important new move in the matter of school hygiene which was taken at the closing meeting of the recent International Congress.

The permanent international committee, consisting of about sixty members selected from almost every country, has hitherto only met during congresses. Arising out of the question of whether it would not be a proper thing to establish a bureau, with a permanent staff, library and museum, and so on, in some central but neutral spot, such as a Swiss or Dutch town, it was decided, as explained by Drs. Mathieu, Burgerstein and Kerr, that it would probably lead to greater progress if such bureau was not localised, but if each country had its own centre for the diffusion of knowledge, and to act as a clearing-house in the matter of school hygiene statistics, laws and regulations. Finally, to supervise in scientific matters and generally to do all that is possible at all times or places to forward the human interests which are bound up in the special lines of knowledge included in school hygiene, the international committee has formed a small council.

This council has all the powers of an ordinary committee. It can form sub-committees of experts on special inquiries. The usual committee procedure is to sit round a table and discuss matters, but this council will deal with the various subjects that arise, submitting the different topics by correspondence, collating the answers, and finally making pronouncements in urgent matters after a meeting of the council.

It is obvious that for efficiency such council should be small and yet have in it elements to secure permanence, and at the same time possibilities of slow but constant change. This has been done by deciding that it shall consist of the president of the past congress, the president of the congress which has just been held and the president of the next congress. Nine other members are to be elected, of whom three are to be from the country where the congress was last held, and three from the country where it will be held next, three being selected from other lands.

Certain matters, for instance, will almost at once come under the consideration of this council. Such might be quoted as:—

The question of how medical inspection of schools can best be carried out with the maximum of efficiency and minimum of cost.

The question of how far the laws of health can best be imparted to the coming generation, so that later they will know how to care for themselves and those dependent on them.

The best systems or methods of physical training for both sexes at various ages.

The feeding of children requiring proper nutrition, so that it shall be done without developing pauperism and with regard to those upon whom the cost falls.

These four matters are being dealt with practically in a great variety of ways, and this council should be able to

collect and analyse known facts to show which methods are best for any town or state.

It is obvious that information thus digested will have a very great value politically as well as educationally, and this council may in time come to be officially regarded as quite analogous in matters of school hygiene to that other Congress of Peace now in session at The Hague.

LAUDER BRUNTON, President.

JAMES KERR,

E. WHITE WALLIS,

Hon. General Secretaries.

Royal Sanitary Institute, London.

### GENERAL.

**His Highness Prince Henry zu Schönaich-Carolath** has graciously consented to act as president of the fourteenth International Congress for Hygiene and Demography. Dr. Rubner, privy councillor of medicine, professor of hygiene at the Royal University of Berlin, and Professor Dr. von Mayr, Under-Secretary of State, Munich, will be vice-presidents.

**Messrs. W. E. Sproat & Eldon Warwick**, architects, Liverpool and Birkenhead, have been awarded first place in the competition for a Carnegie library to be erected in Birkenhead, at a cost of 13,000*l.* Mr. C. Heathcote, the assessor, examined twenty-two sets of drawings, and awarded second and third places to Mr. T. T. Rees and Mr. C. E. Deacon respectively. Messrs. Sproat & Warwick's plans were adopted on Wednesday by the Birkenhead Town Council.

**Mr. Francis Ford**, late curator of the Royal Architectural Museum, Westminster, and secretary of the Society of Art Masters, died at his residence in Fulham on the 19th inst. at the age of seventy-six.

**Cracks** having appeared in the walls of the north and south transepts of Southwell Minster, the Ecclesiastical Commissioners are taking steps to prevent further slipping of the foundations. The process of underpinning and broadening the base upon which the masonry rests is in progress. The parts affected form, with the nave, the oldest portion of the cathedral, having been built early in the eleventh century by Archbishop Thomas. The cathedral is in no immediate danger.

**The Parks Committee** of Glasgow Corporation, having accepted from the Glasgow and West of Scotland Technical College the statue of James Watt, from the top of their old college buildings in Bath Street, have appointed a sub-committee to arrange for it being placed in a suitable position in a public park.

**At the Meeting** on Monday of the Stirling Town Council it was reported that seventy architects had received copies of the conditions of competition in connection with the competitive plans for the proposed new municipal buildings.

**The Scarborough District Council** have agreed to pay 670*l.*, the amount claimed by the officials of the Duchy of Lancaster for damage to the Duchy plantation at Cloughton, alleged to have been caused by the hot cinders from the Council's steam roller having been thrown on the roadside.

**Sir W. Robertson Copland, M.I.C.E.**, died at his Glasgow residence on Monday, at the age of sixty-nine. He was born at Stirling in 1838, and was educated at the High School, and subsequently at the High School and University of Glasgow. At the University he was first prizeman in mathematics and in civil engineering. Civil engineering he chose as his profession, and his practical knowledge of it was gained chiefly in the office of the late David Smith, C.E. Later he joined the engineering staff of the old Edinburgh and Glasgow Railway. From 1862 till 1866 he held the position of burgh engineer in the town of Paisley, which post he forsook to enter business in Glasgow as a civil engineer on his own behalf. He acted as consulting or constructing engineer in connection with many great water undertakings in the United Kingdom and abroad. As witness, arbiter, or oversman his services were constantly requisitioned in connection with water schemes or disputes related thereto. His chief public work was in his association with the Glasgow and West of Scotland Technical College. Two-thirds of the new institution have been erected in George Street, Glasgow. As chairman of the governors he was indefatigable in his efforts to raise funds and it is mainly due to him that the sum of 250,000*l.* has been collected.

**The Historic Parish Church** of Carisbrooke, Isle of Wight, has recently undergone considerable repair, and the decayed stone treated with a preservative fluid, but it has now been discovered that the roof needs more attention than was

anticipated. The Vicar of Carisbrooke, in appealing for financial support, says:—"We are anxious to repair the ancient roof instead of building a new deal one. The old roof can be restored at considerable outlay of time and material, and it seems very desirable not to injure the venerable character of the building. We are very short of money, and we seem to have dried up all the ordinary springs of benevolence. This is a building in which the whole island takes an interest, and we are constantly being entreated not to alter and modernise it. We are as anxious as anybody to pursue this course, but what are we to do when we are left without funds? The work ought to be thoroughly done."

**The Government** of Jamaica invite applications for the post of surveyor and architectural officer at a commencing salary of 600*l.* before September 10. Candidates must be thoroughly qualified as building surveyors and, if possible, designing architects, and must have worked under some important municipal body.

**Two Months** ago the governors of Castleford and district secondary school held a competition for plans for new premises. Mr. W. S. Brierley, York, the arbitrator, considered those of Messrs. Robinson & Jones, architects, Leeds, the best of the 38 sets submitted. The governors, however, after consultation with the authorities at Wakefield, set them aside in favour of those of Mr. W. S. Braithwaite, another Leeds architect. Efforts to secure the work to the premier winner have failed. The urban council concerned—Castleford, Whitwood, Allerton Bywater and Glass Houghton—all object to baths, which the adopted plans include, as causing unnecessary initial outlay and upkeep, and as likely to injure the baths about to be erected in Castleford. Castleford Council, a member of which is chairman of the governors, failing to get satisfactory reasons for their action from their representatives have called upon them to resign.

**The Committee** formed to carry out the erection of statue to the Greek Emperor Constantin Paléologue, killed in 1453 in defending Constantinople, at the time the town was taken by Mohamet II., invite entries for an international competition, which will be judged by an international jury in Rome from June 18 to October 28, 1908. Artists must submit their models of the statue, the pedestal, and the bas-reliefs which will ornament the pedestal. The statue and the pedestal will be finally made in marble and the bas-reliefs in bronze. Particulars can be obtained from the Greek Legation in London.

**The Report** of the director of the National Gallery of Ireland for 1906 shows that among the pictures purchased for the collection was a Holy Family ascribed to Jacob Palma, for 500*l.* The most interesting gift received by the gallery was a portrait of the Irish antiquary, Dr. John O'Donovan, by Charles Grey, R.H.A., presented by his son Mr. R. O'Donovan.

**The Five Urban District Councils** of Farnworth, Worsley, Little Hulton, Kearsley and Little Lever, in south-east Lancashire, which have a joint population of over 60,000, are combining to build a Secondary school for their united needs. It will be situated in Farnworth, and will accommodate 350 scholars. The scheme is now well advanced.

**The Manchester Education Committee** are about to make application to the Local Government Board for their sanction to the borrowing of 5,000*l.* to cover the cost of the alterations and additions to the Ducie Avenue Municipal school, Greenheys; 9,500*l.* to cover the cost of the additions to the Southall Street Municipal school, Cheetham; and 9,700*l.* to provide for the cost of the enlargement and improvement of the Ardwick Municipal school.

**Owing to the Great Increase** in the number of students at Ruskin College, Oxford, the staff is being increased. There are at present fifty-two students in residence, consisting of twenty miners, seven engineers, four weavers, four railway servants, two boilermakers and one each of the following occupations:—Cotton-drawer, joiner, harness maker, shipwright, steel smelter, compositor, carter, stone carver, coachmaker, tailor, patternmaker, gasworker and iron-moulder. The plans for the new building are now under the consideration of the college. It will be erected on the site of the temporary buildings adjoining Worcester College. The present buildings are to be pulled down and a new college, with accommodation for 100 students, erected. For this purpose the college will require about 20,000*l.*

**The Manchester and Salford Trades Council** has passed a resolution expressing the Council's approval of the holding of an industrial exhibition in Manchester in the year 1910.

## THE WEEK.

EVER may be the demerits of the Small Holders' Bill, the present state of the rural districts makes it very likely that an experiment of the kind should at once be tried. As the Bill left the Commons it was expected that in cases where compensation had to be made the amount was to be determined by a valuer. There are a great many surveyors all over England who are competent to deal with such questions, and there is no necessity to create a new body of men. The Lords, however, proposed the substitution of "arbitrator" for "valuer." The difference in the two would mean a much larger expense than was anticipated. From motives of economy the Commons did not accept the amendment, and the Lords did not assent to it. The following sub-section was, however, inserted by Lord ST. ALDWYN:—"The matters to be referred to a valuer before the commencement of the compensation created by the compulsory hiring shall, at the application of either party, be ordered to be referred to the Board of Agriculture to be determined by arbitration instead of by a valuer. Provided that the costs of the arbitration which the Board may have incurred by reason of such matters referred to arbitration instead of to a valuer shall be borne by the party applying for arbitration." Every one who has had to deal with landowners and tenants must know that the procedure which is to follow is not only costly, but embarrassing. The fact that the Board of Agriculture can have a voice in the matter may be considered as a saving clause. But it does not follow that in a Government office all the details of petty cases can be considered. From his own knowledge it would not be difficult to acquaint a surveyor with the particulars of the dispute, and his coolness and temper would be saved by his adjudication. As Lord ST. ALDWYN pressed his proposal, it was accepted.

A prospectus of the Glasgow School of Art for the year 1907-8 has appeared. It will commence on September 5. The Director of Architectural Studies is Professor of Design is M. EUGÈNE BOURDON, an architect. Mr. A. M. GIBBON is also professor, and the instructor is Mr. W. R. WATSON. It is stated that the School of Architecture is under the superintendence of a joint-committee representative of the Technical College and the School of Art. The instruction is given in both institutions. The Glasgow Institute of Architectural Studies recommends to architects' pupils and students attendance at the classes in the School of Art as a necessary part of their architectural education. The diploma course, taken as much as possible in the day classes, is particularly recommended. The Royal Institute of British Architects has granted that:—"The diploma or senior certificate of the school (the latter with the full preliminary examination) exempts from the preliminary and intermediate examinations of the R.I.B.A." The diploma course of study leads to a diploma, and is a full diploma course. A restricted portion of the course, called the certificate course, qualifies for a certificate, the junior division of this course for a diploma. The diploma course, which is preliminary examination, may be taken in the day or in the evening classes. The certificate course is required. Special courses of study have been provided:—(1) For architectural students who, under exceptional circumstances, take some of the day classes; (2) for students of the painting, modelling and drawing classes of the School of Art and for students in the Technical College who require some

architectural instruction. The new school building, designed by Messrs. HONEYMAN, KEMP & MACKINTOSH, is expected to be ready for occupation in September 1908. Towards the cost the Scottish Education Department have subscribed 15,000*l.*, and the Corporation of Glasgow 3,000*l.*

THE number of advertisements which offer accommodation to visitors to the Isle of Arran during the season is generally surprising. For a place which is in such general request the accommodation is limited, and in consequence is expensive. However, the island offers so much that is novel to a townsman that the inconvenience of small rooms and high prices is ignored. There is always grumbling against the enactments of the estate office, which are obstacles to building. Many people who are connected with building finance look with amazement on the splendid opportunities for profit which are neglected. Visitors are usually informed of the dislike to their appearance which is entertained by the owners of the island. They also learn that, except in one or two places in a limited area, all the occupants are tenants-at-will. If an innkeeper were to change his premises into an hotel without permission he would be liable to eviction. It is now said that a change is contemplated, and that feus or leases will be granted. That intimation ought to be sufficient to attract speculators not only from Scotland, but from England. Indeed, nobody would be surprised if some Americans seized the opportunity for building lodging-houses, hotels and residences on a great scale. Owing to the peculiar character of the circular from the estate office, there is at first an unusual hesitation to take advantage of what ought to be a most fertile source of profit. No doubt something will be done to allay misapprehension. But, considering what Arran is and what it could easily become, the delay is tantalising at least.

THE casts of fragments of sculpture from the frieze of the Parthenon presented by the Greek Government to the British Museum may cause some visitors to ask why the originals were not removed by Lord ELGIN with the other examples from the temple. Only one specimen is found in the collection; it represents two horsemen, one of whom appears to be urging his comrade to take his place by his side. It was considered by VISCONTI that the cavalry shown on the western frieze represented the last comers, some of whom were endeavouring to join the main body, while others are shown as mounting their horses. The western frieze is remarkable because it suggests that the figures were not equally crowded throughout. One of the horsemen suggests the richness of the armour which was sometimes worn by the Greeks. Another figure is interesting because the youth is shown wearing the Thessalonian hat. The western frieze extended over the pronaos, and over the antæ or door-posts of the opisthodomos, or back entrance. Dr. MURRAY considered that some of the men shown on the western frieze were intended to suggest a class of assistants. He has found that there are no horses for six of the figures, and that one man who is evidently intended to be an equestrian awaits his horse. He also remarks:—"Looking behind the necessities of artistic composition we see that this west frieze represents a number of characteristic groups such as would be observed scattered over the open space of preparation, and looking at it as a composition we admire the extraordinary skill with which a predominant movement in one direction, absolutely required by the form and dimensions of the frieze, is combined with an almost infinite variety of action and attitude, which indicates the incompleteness of the preparations and the scattered position of the groups in the reality." Although only casts, the addition of the western frieze will give a new interest to the parts already possessed by the British Museum.

## THE BRITISH MUSEUM.

THERE are two statements in the "return" of the British Museum which cannot be considered as satisfactory. One relates to the appearance of serious defects in the facing stones of the buildings. Iron plugs were used instead of copper plugs for bonding, and by the oxidation of the iron a very large portion of the surface has been cracked and burst. The other statement is the record of the continuance of the decline in the number of people visiting the collections. In the preceding year there was a falling-off of over 140,000. According to the latest return there was a further reduction of nearly 122,000. Fewer people enter the Museum on Sundays, and the number of students in the Reading-room was also less than in the year before. The masonry can be repaired, but it is difficult to see what measures can be adopted which will have the power of attracting visitors.

The scheme of extension which is now being carried out from the plans of Mr. J. J. BURNET is described. Further precautions against fire have been adopted by the introduction of sectional walls in the roofing. All the wooden floors in the galleries have been planed and polished. There is not only increased cleanliness in the galleries, but in the interior of the show-cases. For, in spite of all precautions, the floating dust raised by the traffic of the visitors could not be prevented from penetrating them. Electric fans and additional skylights have been introduced in some of the galleries. An improved drainage system has been completed at the Natural History Museum at South Kensington, an electric-lighting scheme is under consideration, as well as proposals for better ventilation.

Egypt appears to be inexhaustible, and the acquisitions comprise much which is interesting. Although they are supposed to date from so late a period as the eighth century of our era—which is modern for anything Egyptian—the artist's palette in ornamented leather, with a support for the wrist, water-vessel and cavities for the reed brushes, is likely to be more attractive to some of our readers than larger works. Another curious addition is the limestone base of a pillar which was hollowed out and made to serve as the apse of a small shrine in a Coptic church. However, for architects the most important addition of the year is a hard dark granite statue of SEN-MUT, the famous architect and builder of the temple Tcheser Tcheseru, *i.e.* the "Holiest of the Holy," of Queen HĀTSHEPSET, who reigned over Egypt about B.C. 1550. SEN-MUT was the "chief of works" in all Egypt, the "chief craftsman of every trade," and he was the overseer of the house wherein the tribute in gold paid by the Soudan was stored. The queen adopted male attributes and attire, and she appears in this statue as the "Young Horus," whom the architect holds on his knees.

Of late years Assyria appears to render nothing but records of baked clay. One in the form of a cone bears the name of SAMSU-ILUNA, king of Babylon, about B.C. 2145. It commemorates the rebuilding of the great wall which surrounded the city of Sippar in Babylonia. The king states that he undertook the work at the direct command of SHAMASH the sun-god, the patron deity of Sippar, and of MARDUK, the god of the city of Babylon, his capital; and he declares that, by their help, he brought the work to a successful issue. It is needless to say the opportunity is taken to record the king's titles and his achievements, and how well he stood with the sun-god. It is the largest example of a cone memorial known to exist. Among other tablets is one inscribed with the lists of the labourers or slaves employed on some of the great temple estates. Three limestone slabs with figures in relief have been obtained.

It is difficult to acquire worthy objects for the collections of Greek and Roman antiquities. Several examples of jewellery have been secured. A statuette of a woman in a long Ionic chiton, holding her skirt with her left hand, was purchased in Bergen, in Norway, and was said to have been found near that town with

three Italian fibulæ. It suggests part of the derived in some raid by the Northmen. A few g marble sarcophagus with a representation of a carved on its front, and several terra-cotta objects also purchased. Among the donations are a of thirty-three plaster casts of fragments from frieze of the Parthenon, taken from the origin Athens. These are intended to complete the M series of the Parthenon frieze, and were presented by the Greek Government. Another series of found on the site of an ancient sanctuary near De perros, in the Sierra Morena, Spain, and probably belong to the pre-Roman period about sixth century B.C., consist of 103 votive offerings chiefly bronze statuettes of a rude type representing men and women. Besides these there are models of parts of the human body and implements three bronze fibulæ and one statuette in iron. ARTHUR EVANS has given several examples of fragments of wall-painting, models of stone vases and other antiquities found at Knossos.

Early British antiquities cannot be said to be as much interest as those from Eastern Europe and Asia. Among the additions are eight gold bracelets found in a gravel-pit at Bexley, Kent; two emerald gold bands from Ravencliff Cave, Derbyshire; stumps of stakes used for defending the ford at Bexley, where CÆSAR probably crossed the Thames; bronze brooches, gilt pendants, pin, stylus and fragments from two graves at Leagrave, Beds.

The Department of Coins and Medals has been enriched by several valuable examples. Three of from Volo are supposed to be unique. A penny at Romney, in Kent, is evidence that the mint was in operation in the time of HENRY I. It is not often that are amusing. But one ordered by NAPOLEON I. when he was preparing for the invasion of England in 1803, can hardly be considered as more than a piece of a trap. On the obverse is the head of NAPOLEON, and the reverse HERCULES overthrowing a marine with the legend, "Descente en Angleterre—France Londres en 1804." This medal was struck from finished dies made by JEUFFROY and DENON, and is probably unique.

The most important addition of the year consists of 5,551 pieces selected from the extensive collection of Dr. FREDERICK PARKES WEBER. He gave the Museum the right to choose any specimens they might like. There were coins of all periods, primitive foreign currency, British and Colonial coins and numerous medals. Specimens representing methods of coinage and adulteration were also included in Dr. WEBER's collection.

The King has presented to the Department of Manuscripts two charred papyrus rolls from Herculanum which originally formed part of the gift of the Neapolitan Government in 1803-6. Five rolls from the collection were presented to the British Museum by H.M. Queen VICTORIA in 1865; the rest were destroyed in unsuccessful attempts to open them. Of the rolls now presented, one has been opened, and portions of the work of EPICURUS, "De Natura Deorum," other is unopened. The Egyptian Exploration Fund has presented twenty-two papyri from Oxyrhynchus. A large collection of Greek papyri was also purchased. The principal bequest received during the year was from Mr. ROBERT PEARSON BRERETON, of Oundle, who consists of his collections in twenty-three volumes relating to the churches of North Northamptonshire, Rutland, and to the church towers of Somersetshire. It includes, besides notes and an incomplete architectural history of the buildings, nearly eight hundred permanent photographs taken by himself.

Many drawings of details of English castles, old houses, &c., were bequeathed by Mr. C. A. BUCKLER, by whom, as well as by other members of his family, several series of examples already in the Department. Three volumes of drawings of

o. Northampton, with notes by GILBERT FLETCHER, Towcester, 1807-12, were presented. Another set consists of seven volumes of collections by the Sir H. DRYDEN, Bart (d. 1899), relating to broughs, houses, stone circles, &c., in Scotland and the Land Isles, with drawings, plans, &c. The Department of Prints and Drawings has been enriched by no less than 4,176 examples. One hundred and two portraits, chiefly executed in pencil, of eminent persons of the nineteenth century are by HENRI and RUDOLF MANN. The Trustees have acquired from Mr. ARTHUR RYSON a collection of 1,851 Japanese colour-printed cuts (on 2,101 sheets). It was formed with the aid of the best Japanese experts, all but first-rate examples in fine early states being excluded; so that, although there exist much larger collections, there are few of more uniformly high and select quality, or so well fitted to form the nucleus of a standard series for historical and technical study of this very important branch of Japanese popular art.

It will be evident from the foregoing examples of additions to the collections that if the British public do not visit the Museum, it is not from the absence of interest in the different departments. Much else could be mentioned which is deserving of attention. But there can be no question that for instruction there is no museum in Europe which offers a more varied assemblage of objects than can be found in Bloomsbury.

## ARCHITECTURAL SCULPTURE.

THE numerous buildings erected of late years in London in which sculpture is employed must strike the most indifferent spectator. It is the more remarkable when we consider the neglect of sculpture as an architectural accessory which has prevailed in this country for so many years. We could understand architects who had to expend money considering that it was preferable to pay for a piece of sculpture which might be observed in a gallery or a drawing-room than to expend the money on a statue or a relief to be placed on the exterior of a mansion exposed to all the vicissitudes of the climate. But what is remarkable is that men who posed to be legislators in art seemed unconscious of the advantage which sculpture, when judiciously and architecturally employed, could impart to a building. A few examples may be cited.

Mr. CHARLES EASTLAKE was consulted concerning the most efficient way of decorating the new Houses of Parliament. He wrote several reports which will be found in the Blue-books. Among other subjects treated of was sculpture. But although his long essay was reasoned, sober and safe, it would be impossible to extract from it any desire to have sculpture employed in the new building.

Some years earlier FLAXMAN lectured on sculpture to the students of the Royal Academy, and the reports of his lectures are to be found in the Blue-books. He said that he could not well teach the architectural sculpture of Egypt. But he pre-treating of the statues. With later works he proceeded in a similar manner. FLAXMAN was not employed in the decoration of buildings, nor were any of the artists addressed likely to be more fortunate. Their commissions would probably be confined to statues, and small reliefs. The teacher acted honestly towards them by offering suggestions concerning the work by which they would be enabled to live. At FLAXMAN's time it might be supposed there was a fashion of decorating some kinds of structure which had been set up as memorials of the war with France. At REYNOLDS's time such a possibility was not to be considered. The President was therefore to be excused when he lectured on sculpture if he confined himself to the *Apollo Belvedere*, the *Venus of Medicis*, the *Moses*, the *Rape of the Sabines* and a few other works. If he had given consideration to all the possibilities of the sculptor's art he would not have been so

certain about sculpture having only one style, to express which the utmost degree of formality was required.

Whether sculpture arose out of the necessity to decorate buildings has been disputed. There seems little doubt that meteorites and unwrought stones received remarkable reverence from the Greeks. But there can be no question that as men advanced they became more favourable to the representation of figures on the walls of their structures. By that addition they found that buildings became more expressive of purpose and other meanings, so they continued the practice. The sculptor's art can to-day be as serviceable as it was with the Egyptians, Assyrians and Greeks. It would perhaps be more correct to say that the necessity with us is stronger. We have greater varieties of buildings than the ancients possessed, and it is not always easy to make each of them suggest its purpose. But any deficiency of that kind can be more or less compensated by sculpture or painting. In the days of REYNOLDS it was considered that sculpture had an onerous task in self-explanation. "Take from APOLLO his lyre," he said, "from BACCHUS his thyrsus and vine leaves, and from MELEAGER the boar's head, and there will remain little or no difference in their characters." But by somewhat greater freedom of treatment modern sculpture can be made to serve as explanatory of the building it adorns, owing to the judgment exercised in the selection of the figures.

It would be advantageous if, for a time at least, all figures which are introduced as adornment of architecture should have a relation to the building which can be easily perceived. In churches it is possible to have saints who are typical representatives of the virtues. It would also be allowable to employ figures representative of the old and new Dispensation, like those to be seen in some Mediæval churches. A scene like that employed by BIRD in the western pediment of St. Paul's would also be evident to all Christians. There is a danger, however, when certain figures are inevitable that they will become stereotyped in character. If we take the evidence of VIOLLET-LE-DUC, French architectural sculpture long suffered from that evil. On demand any sculptor who went in for such work would be able, he said, to supply sketch models of Industry, Agriculture, Music, Poetry, Glory, War, Faith, Charity, Peace, the Sciences, the Arts, the Muses, &c. As generally little time was given to consider what was desirable or apposite, in the end the commissions were divided, and the sculptors were indifferent to what kind of figures fell to their lot. VIOLLET-LE-DUC's remedy was the employment of a single sculptor for the whole of the building, or, if that was too large, then for a definite part of it. As that course was rarely possible, owing to the number of privileged claimants, he said that all wise architects in France disclaimed responsibility for the sculpture of their buildings. It may be a long time before such a state of affairs is possible in this country. But it can to some extent be remedied if the architect will think out the scheme of sculpture, leaving details to the interpretation of the sculptor or sculptors employed.

FALCONET, the French sculptor, considered the most dignified aim of his art should be to perpetuate the memory of illustrious men. We have only to look at the array of portrait statues outside the Louvre and the Hôtel de Ville, in Paris, in order to realise how persistently his countrymen have kept that aim in view. But sculpture may also serve, he says, although less usefully, as simple decoration. To many the latter is the more important field of the two. It is not easy to exercise imagination in portraiture, and the beauty which should be esteemed by the sculptor has often to be sacrificed. A fine example of decorative sculpture can always be appreciated, while there must be differences of opinion about the merits of illustrious men. It takes time to make out the connection between a purely ornamental figure in relief and the building of which it becomes a part. We may expect that the clerks in Mr.

HARE's Insurance Office in the Strand will often be troubled by strangers who will be desirous of knowing the meaning of the numerous figures. Occasional instances have occurred where sculpture which was imaginative was interpreted as presenting a series of portraits. Allegories are foreign to the English understanding, and it is with difficulty an ordinary spectator becomes convinced that occasions arise when figures more or less allegorical are the most fitting for the purpose of ornamentation.

Purely decorative sculpture is, however, preferable to sculpture which is constructively useful. It is impossible to discover the reasons which so sensitive a people as the Greeks could give for substituting caryatides for columns at the Erechtheum. The legend about the figures serving as memorials of a victory over the Carians suggests that long ago judges, or citizens who retained their good sense, condemned the substitution of copies of living models for adequate supports. The Atlantes or Telamones are more massive but are also objectionable, and for them also the excuse of a legend is offered. Whether designed by a Greek, a MICHEL ANGELO, or a modern sculptor, there is no excuse for the economy which would make the human form sustain a weight which no bones or muscles could withstand. With as much reason the acanthus could be represented as bearing the weight of a building on the tips of its leaves. If figures are introduced in connection with construction, care should be taken that they are not in positions which are degrading. The Roman poet recommended his contemporaries to avoid bringing in a god unless for a purpose worthy of one, although in those days the Olympians were as numerous as supernumeraries in a stage pageant. In a similar way, if we are to employ sculpture, let the men and women be treated with the respect due to humanity.

#### EGYPTIAN TEMPLES AND WELSH CIRCLES.

ADDRESSING the Gorsedd of the Bards at Swansea, where he had conferred upon him the degree of ovate by the Archdruid with the title "Gwyddon Prydain," Sir Norman Lockyer said that he could not tell them how impressed he was with what he saw. Perhaps he was the more impressed because for the last three or four years, although before then he had known nothing whatever, he was ashamed to say, about this wonderful Gorsedd, he had in his mind such a picture as he had seen to-day. He went to Egypt to study the ancient monuments there, and in many of the temples he found evidences of past worship of the sun and stars. The temples were pointed first to the sun in May, next to the sun in June and next to the Northern Star. Three years ago he went down to Cornwall in order to study the circles there, to see if by chance he could find out any similarity between the old Cornish remains and those of Egypt. He found when the circles were carefully examined that generally they contained about a dozen stones. There were outstanding stones in certain directions. He made a map of these, and to his great astonishment he found that the direction of these stones was identical with the direction of the Egyptian temples. He said so, and people laughed. He showed a copy of this map to a Welsh gentleman, who told him, after he had examined it in conjunction with the plans of the Gorsedd which he had discovered among some old writings, that he had found the greatest similarity between the two. He then found there was not only similarity, but that the things were identical. He could not, of course, take that opportunity of saying more about the astronomical aspect of the inquiry, but, if he might be allowed to express an opinion, he was convinced that this Welsh Gorsedd, this circle with its outstanding stones, was the distinct descendant, almost without a break, of those circles which he examined with such care in Cornwall. "If that be so," continued Sir Norman, "to-day you are doing what has been done in Cornwall, and no doubt in Wales, for the last 4,400 years. The Cornish circle to which I have drawn attention is the Cornish Gorsedd Boscawen, and I have no doubt about 4,000 years ago there was a meeting very much like this meeting which I have to-day been privileged to attend."

#### WHITBY ABBEY.

By J. G. HOLDSWORTH.

*Historical.*

THE earliest knowledge we have of Whitby Abbey is not very definite. The first mention of the which may be considered authentic was made by Bede and one may infer from his writing not only that it was in 656 Streanæshalch, but also that about that time an Anglo-Saxon monastery was founded there.<sup>1</sup>

Streanæshalch was a "place-name," with no definite meaning, but, unfortunately, that meaning is uncertain. The most probable conjecture is that made by the Rev. J. C. Atkinson, who has found that the name *Streone* was known in the eleventh century, "in the form of an agnomen or nickname—Mr. Freeman calls it a name."<sup>2</sup> The suffix in its true forms was probably *halch*, or *halc*; by usage the *c* was sometimes dropped and it would become *halh*, *healh*, or *heale*. The name *Dunscinghalef*, or *Dunscinghalc*, is mentioned in connection with a gift of Robert de Liverton to St. Hilda of Whitby and about the meaning of the suffix Mr. Atkinson remarks a little further on in the same part of his Introduction "the ascertained site of Streanæshalch was a level space in for many hundred yards with precipitous cliffs—in other terms, a 'heugh'—and the philological probability, or (is) that *halch*, *halc*, *halef*, *heuch*, *heugh*, are only different forms of the same word."

Streanæshalch, or Streneshalc (there are varying forms of spelling in use), became known under the name of Prestebi; and when the abbey had become important in the twelfth century, we find that Prestebi had become known by the name of Witebi,<sup>3</sup> the name of Prestebi eventually dropping out about the end of Henry I's and beginning of Stephen's reigns. The date of the foundation of the monastery is probably about 656; for Bede states it to be about 10 years after the battle of Winwidfield, commonly supposed to have been fought November 654; but Florence of Worcester, who is also perhaps one of the most accurate of the ancient English chroniclers, assigns the date at 658, assigning of the battle as having been fought in 655. Oswu, Oswy, king of Northumbria, fought this battle with Penda, king of Mercia, a pagan. Oswy vowed before the battle that should he be victorious he would dedicate his day to God, and with her give twelve "possessions" for the building of monasteries. He gave six in Bernicia and six in Deira; Cleveland, in which Streoneshalc (ancient name), Prestebi (Danish name) or Witebi is situated, was a constituent part of Deira. King Oswy's little daughter, the young Princess Ælfleda, entered the monastery of Heoruteu. One authority suggests she could have been scarcely two years old when she became a candidate for admission to "monastic" life. She was certainly young. Of this monastery Hilda was then abbess. Hilda, or Hilda, was great-niece of King Ædwin; she had been converted and instructed by Paulinus, or by the missionary who accompanied him, and was professed as a nun by Aidan.<sup>4</sup> Before she came to the new foundation of Streoneshalc she appears to have originated this religious house of Heoruteu. Some think that she purchased or procured hides of land for the site of the Streoneshalc monastery. She may have procured some of the land before, but it seems likely that the ten hides<sup>5</sup> at Streoneshalc were a portion of King Oswy's grant; for these "possessions" were given together with his daughter, who at that time came into Hilda's care.

The institution, though begun on a quite small scale, very speedily grew in importance, and was soon the chief religious house of Northumbria. There is an absence of tradition as to the form of the original structure, and we have no certain data relating to dimensions or the exact site; but we have some reason to believe that it must have been a very humble edifice, the church made probably of the split trunks of trees, smooth inside, and roofed with reeds or thatch. Probably the rudeness of these convent buildings matched the rudeness of the church, all being furnished in the simplest style of the time, the fame of Hild's rank, piety, intelligence and pru-

<sup>7</sup> A hide, according to one view, is land sufficient for the support of a family, possibly about 120 acres.

ether with the presence of the young princess who was educated there, attracted numbers to their monastery. was dedicated to God in honour of St. Peter. Also, according to the prevailing custom, it was for the religious of both sexes.

There was probably a reason for the selection of Streonshalc as the site for Hild's monastery, for it probably was already a noteworthy place before this time. The abbey continued its fame and helped its progress, in the course of time absorbing all interest and importance. Bede tells that Edwin and Ealfleda, also her father and mother, and Eadwulf and Eanfled, and many others of noble rank, were buried "in St. Peter's Church in the Monastery." King Edwin lost his life in the battle of Haethfelt in 633, and his head was taken to York first and after to St. Peter's, his body being buried at Streoneshale; and, as the foundation of the monastery was probably 656 or 657,<sup>8</sup> evidently this interment was many years earlier than the foundation. William of Malmesbury stated that it was the largest of the monasteries founded by Oswy's bounty. In the year 663 or 664 the famous Synod of Streonshalc was held, to decide what date should be kept for the observance of Easter, that of the Romish Church or of the British, also touching the priestly tonsure and some other minor matters. Oswy himself presided, and Alchfrid, who was both a reigning prince and Oswy's son—St. Alchfrid, Bishops Colman and Agilbert, Romanus, queen's chaplain, the venerable James, long associated with Paulinus, and, naturally, the Lady Hilda herself, were present. They decided for the tenets of Rome; and the Church was organised by Theodore of Tarsus, sent from Rome for that purpose.

There must doubtless have been very real intellectual life in this institution, as well as spiritual and religious life. Generally, for, even discounting the numerous and tenaciously held legends of the period and since, there were yet many noteworthy men educated by and sent forth from it. There were, for instance, Bosa and "Wilfrid the Younger," both of whom went forth as bishops to York; Aethelstan and Eadwulf, who passed from there to the southern bishoprics of Winchester and Worcester; St. John of Beverley, who went to Hexham and then to the Bishopric of York.<sup>9</sup> And up to this period belonged Caedmon, the Saxon poet. His dream to the Creator (which a foolish legend states that he dreamed in a sleep or trance), having been preserved in King Alfred's Saxon version of Bede's history, is doubtless the oldest specimen of Saxon poetry extant. He afterwards composed a poetical paraphrase of a very considerable portion of the Scriptures. He was probably one of the first in England to appeal to the imaginative faculties of the people in aid of religious belief. He is supposed to have died the same year as his Abbess Hilda.

Hilda died in 680 and was succeeded as abbess by her pupil Eilfleda, who doubtless benefited at first very much by the help and counsel of her mother and Bishop Eadwulf. This good and wise old bishop retired to her monastery for refuge when the Picts invaded his district. Eilfleda died in 713, being then in her fifty-ninth year. There is then no record of the work and progress of the Whitby House, but it is thought to have been governed by Eilfwine; if there were any records kept they were either lost or destroyed, and we next hear of the ruin of the monastery by the Danes. It had, however, evidently continued in growth.<sup>10</sup>

It has been alleged that after the arrival of the Danes and the consequent destruction of the monastery, 867-70, the accompanying ravages and pillage in the adjoining district, "Streonshalc lay desolate for 207 years;" and then, "When after the lapse of 200 years the monastery was restored, the town revived also;"<sup>11</sup> and a later writer writes more than once that when the town revived it was "arose, like its predecessor Streonshalc, as a tendency on the abbey."<sup>12</sup> This has since been proved to be incorrect—the Streonshalc which "lay desolate" was the monastery only, for in the "Memorial of Benefactions" in the Whitby Chartulary (called also "The Priory Book" or "The Whitby Register," the writing of about 1160) we find a list of twenty-one Whitby places—nineteen of which are Danish—and the fourth on the list is Thingwala. "Streonshalc and its environ-

ing district had, long before the Norman Conquest, become the seat of a number of separate and independent Danish settlements." Of this name of Thingwala, Worsaae writes that it "affords a very remarkable memorial of the Court—or Thing—which the Northmen settlers were accustomed to hold in close connection with their sacred offerings to their gods." At the beginning of the thirteenth century or later the site of the Thingwala was still known, but all trace of it has subsequently been lost. It shows very definitely that the Danes made Whitby their most important town in Cleveland, and held their chief civil and religious proceedings in it. This is hardly compatible with the idea that the town and monastery lay desolate and ruined until the rebuilding and refounding of the religious house in Norman times. The Domesday returns, too, prove that the town had both continued and flourished, but "for two hundred years and more the holy service of the monks and pious nuns was in that place discontinued."<sup>13</sup> One may form a theory, though, that some of the oratories on "Pretebi heights" may have had holy tenants during that time, very likely all that time—hence probably the name of Pretebi. An old writer observes<sup>14</sup> of the period before the great ruin:—"There were at that time, in the said vill, as ancient countrymen have delivered to us, about forty cells or oratories, only the walls of which, however, together with the disused and shelterless altars, remained." The early monastery had evidently very greatly grown; and strong, well put together, and indeed massive buildings must have replaced the quite early wood and thatch, if parts of it were still standing after (1) the Danes' destruction and (2) of two hundred years of neglect in so exposed a position. The house was revived, however, when the Normans became masters of that part—Reinfrid, the first prior after its restoration, had been one of the Conqueror's most active soldiers. He became a monk at Evesham, being there well trained in monastic discipline. Having visited Whitby when in the army, he had viewed its ruin with some compunction. He therefore returned to Northumbria, after his training at Evesham, with the definite intention of recovering from its neglect and depression the monastic religion. He obtained a grant from Lord William de Percy of the ancient monastery of St. Peter the Apostle, together with two carucates of land in Pretebi, in frankalmoin (free alms).<sup>15</sup> Other monks joined him, and he began a monastic settlement there. The precise date of the foundation of the new abbey is not known, but is thought to be a little before and not later than 1078, the year when Reinfrid was joined by Stephen of Whitby, who afterwards became Abbot of York. In any case, by the year 1080 formal concession of the site had been given and the monastic settlement fully effected. Freeman<sup>16</sup> gives an account stating the revival of religion in the North to be due to Ealdwine (Aldwin), one time prior of Winchcombe, who took with him from the neighbouring house of Evesham "Eilfwine (Elfwey), a deacon, and Regenfrith (Reinfrid), seemingly a lay brother." They settled first at Jarrow, and there "patched up the dismantled church and built a poor dwelling-place for themselves under its walls." Eilfwine remained as prior; Reinfrid went to revive Whitby. "From Whitby sprang another famous house; under the care of Earl Alan, and under the government of its first Abbot Stephen, the church of Earl Siward at Galmanho grew into the great abbey of St. Mary without the walls of York."

William Rufus, although noted for regular and continual despotic use of his power over the Church, and his spoliation of almost every branch of it, yet continued help to both Whitby and York. In giving them the church of All Saints in Fishergate, at York, he appears to have imposed the condition that a cell should be established and

prayers be made in it for himself and heirs.<sup>17</sup> In the same charter he also gives various lesser rights and privileges.<sup>18</sup> It is said by some critics that some of the gifts and charters supposed to have been given by him were, however, in all probability, gifts of William the Conqueror; again, Mr. Freeman remarks, "The few churches towards which Rufus appears, not as a spoiler, but as a benefactor, are those which owed their foundation to his father."<sup>19</sup>

WHITBY ABBEY—EAST FRONT.

During Rufus's reign the priory was raised to the status of an abbacy. Under Prior Reinfrid's rule, Serlo de Perci, brother of the founder, William de Perci, had entered as a monk, his brother giving an important grant to the priory on this occasion,<sup>20</sup> and at Reinfrid's death had become prior;<sup>21</sup> now, when the foundation was by the founder enriched and raised to the dignity of an abbacy, Serlo was forced by his brother to resign the headship, and was permitted to retire to the priorate of the cell at the church of All Saints at York. The founder's (and Serlo's) nephew was created abbot in his place. The reason of this supersession is not certainly to be deduced from the existing documents, some of which are a little contradictory. It is known, however, that the nephew, William de Perci, had been created abbot before the year 1100; it is also known that a crusade was organised and started in 1096, and that his uncle William died on the march to Jerusalem at "Mons Gaudium." Probably a sudden accession of fervent religious feeling which made him, who was not a young man, decide to go forth to his fate in the Holy Land, also made him wish to first formally constitute Whitby an abbey. The charter in which he made the necessary gift was, as was customary at that time, not only signed by himself, but witnessed by nearly all his family, certainly by all who would be likely afterwards to have the power to dispute it.

The abbey buildings were being pushed on with all possible speed during the time of Prior Serlo, and in all probability on the same site as the original Saxon church belonging to the monastery before the Conquest. No traces even of that church seem to be left now, certainly no remains;<sup>22</sup> and the buildings of Early Norman date which replaced it after the refoundation of the Priory were also completely obliterated.<sup>23</sup> The greater part of the present remains belong to that period of ecclesiastical architecture dating from 1250 to 1316. It is quite evident, however, that it has been built up at varying periods; but the main

portion shows none of the elaborate ornament which characteristic of later styles of architecture—styles more beautiful, perhaps, but without the grand simplicity of earlier period. We may notice "at the east end and on north side the admirable manner in which the buttresses of the angles of the former, the octagonal buttresses of north transept, and the clusters of cylinders between windows unite together the several stages of the building into one whole, and carry the eye upwards to rest on graceful termination by octagonal pinnacles."<sup>24</sup> This is the earliest part of what is left standing, and was probably built in the earlier half of Roger's abbacy (1233-1235) when a great building effort began and continued probably nearly thirty years, at which period very likely lack of funds may have prevented completion. During time the choir, large portion of the tower, the transepts three bays west of the tower were being built. Two more bays were being built in October 1333.<sup>25</sup> The tower still standing in 1830. It fell that year on June 25.

#### Descriptive.

The portion of the abbey which still remains is of cruciform shape, its present measurements, taken roughly, being rather over 300 feet from east to west, and, as well as can be guessed, about 150 feet from north to south. There is a large amount of dog-tooth ornament both on the exteriors of the east end, north side and north transept, on the triforium, the effect being to considerably lighten and enrich the otherwise severe appearance of the whole. The interior consisted of lady chapel at east end and choir adjoining, with north and south aisles; in the case of the tower, with north and south transepts, and nave to the westward. The south aisle of the choir has suffered terribly, but the north aisle is in far the best preservation, being in its larger part still in possession of its roof. The nave is mainly ruins, the south side having completely disappeared. On the north side the outline of the wall is left; at the west end nearly all has fallen. The western portion of the north front of the nave is of a later period than the remainder of the whole front, being of about the fourteenth century probably; and though very beautiful in parts has yet an element of incongruity when compared with the older portion, which, though not all of one

WHITBY ABBEY—NORTH AISLE.

The only portion with some of the vaulting still remaining

yet all belongs to the same period of architecture. Only a very small piece of the western elevation is still standing, and it is said to have been the most finished part of the whole structure; it fell at the end of the

teenth century, about a year later than the fall of the "south wing." Mr. Churton gives a very lucid description of the interior architecture:—"The triforium, of very beautiful design, deep circular arch formed of a profuse succession of mouldings, relieved and enriched by the dog-tooth ornament, embraces a graceful subdivision of pointed arches and quatre-feuille spandrels supported on clustered columns; as also are the north transept windows, which are deeply embayed within the walls, their arches supported by clusters of cylinders with foliated capitals relieved by hollows filled with delicately carved bosses, which must have formed magnificent frames to stained glass."<sup>26</sup>

There is a legendary belief that very early in the Norman period there was already a chapter-house there; nothing can be traced of it, or of any building of so early a style. Unlike so many of the other fragmentary remains of old buildings in our island, there are not left to us here even separate stones with tell-tale impressions upon them. Perhaps some day a really careful work of inquiry may be undertaken, and more definite knowledge be gained from the often grass-covered ruins and debris remaining; we may indulge the hope that such a day may not be far distant. It will mean much labour and expense, but the work will no doubt be exceedingly interesting, and something is due to the old abbey after so many centuries of neglect. The south portion of the abbey house close by is thought to have been built partly from the ruins of the monastery about 1580, when Sir Francis Cholmley began to build a mansion on the supposed site of the abbot's house. It also has had large additions, and was in the eighteenth century fortified and garrisoned.

There are, of course, the usual beliefs extant about the existence of subterranean passages; and it is said that Mulgrave, Saltwick and other places along the coast<sup>27</sup> are connected with the abbey in this way. Whitby's abbot was one of the "abbots" who were recognised as "spiritual lords," but did not have a seat in Parliament. The last of the series of Whitby's thirty abbots was Henry (Deval), who surrendered the abbey to the Crown in 1540. The "cells"

Charlton, speaking of the destruction of the monasteries, says:—"Among others, Whitby Abbey, after being plundered of the wood, the timber, and lead on its roof, as also of its bells, and everything else belonging thereto that could be sold, was left standing with its stone walls, a mere skeleton of what it had formerly been, to crumble away by degrees into dust or to form a heap of rubbish which might barely show passengers in future ages that there Whitby formerly stood. It is true some part of this lead was laid upon the church of St. Mary, which was still permitted to be the parish church of Whitby, and which seems till then to have had only a thatched roof; but that lead was only a small part of the whole, and all the remainder was carried away and converted into money."

WHITBY ABBEY.

Part of North Wall of Nave, and all that now remains of the West Front.

The ruins of the abbey church—now all that is left of *Whitby Abbey*—still hold their place on the steep-sided and lofty cliff to the east of the old town. They are still a landmark to all travellers, whether by sea or moor or river. Those travellers who know something of the history of their country will see in ruined walls such as these a view-point from which they can look down the vista of the centuries. They will think of the monks who lived there, and of their services in early days to the liberal arts—to history, literature, architecture and art. They will remember them sometimes as earnest priests, sometimes as keen lawyers, and occasionally as great statesmen. These very ruins saw the day when Whitby Abbey was the lord and landlord of Whitby Strand—from Green Dike to Eastrow and several miles inland—and when Whitby town was but a small village of fisher dwellings: they now look down upon a changed land and a busy town. The Dissolution, which left them and others to crumble into ruin, was the sign of a new and larger civilisation. The monasteries had done their work—

The old order changeth, yielding place to new,  
And God fulfils Himself in many ways,  
Lest one good custom should corrupt the world.

## EASEL PAINTINGS.

AN easel picture displays a scene which must be looked at through a frame, as if through an open window. It must be carried out with the intention of being viewed from some one point; it must have unity in the direction of light and unity of general effect. The one point from which such a picture can be well seen is always to be found upon a perpendicular line drawn through that point upon the horizon which is called the point of sight. Easel painting has arrived at a most remarkable perfection of technical skill. Great artists are able to reproduce the most delicate effects of light, and to concentrate the attention of the spectator upon the point that is the chief object of their efforts, and which they isolate from all its surroundings with the utmost care. Easel painting always seeks more or less to deceive the eye. It must of necessity do so, as its aim is to produce the effect of relief upon a flat surface. If a palace has to be represented its different planes must be shown; and we must be able to see at a glance that the columns of a peristyle, for instance, are not at the same distance from our eyes as the rest of the building.

the subordinate houses to the priory or abbey. Those possessed by Whitby were Middlesburgh, Hackness Whitby Strand, Godeland or Gotheland, and the one mentioned before as the gift of Rufus and the place of retirement for Prior Serlo, namely, All Saints in Fishergate York; there were also several hermitages which it is perhaps unnecessary to recapitulate. Those interested may easily find them in the Chartulary of the abbey.

## NOTES AND COMMENTS.

VISITORS from English ports commonly express disappointment when they see Dundee for the first time. The harbour lacks the impressiveness which is to be expected in a place with so large a trade. A long array of timber sheds of a single storey has an almost prehistoric appearance. There is to be a transformation, for on Monday the Harbour Trustees resolved to carry out the recommendations of their engineer by reconstructing the eastern and western wharves and by the erection of new transit sheds. The engineer is to be instructed to prepare plans and specifications, with estimates for the reconstruction of the western wharves in ferro-concrete and for the construction of transit sheds there also of ferro-concrete, the latter to be four storeys high and provided with all the necessary electric or hydraulic equipment in the shape of travelling cranes, &c. The proposal is that the work should be carried on in two sections so as to interfere as little as possible with the traffic. The trustees are already acquainted with the qualities of ferro-concrete, for they have had a wall constructed with the material, and it shows no signs of decay. It is expected that a sum of at least 100,000*l.* will have to be expended.

OBJECTS which appear strange to modern understandings are described in archæological dictionaries and inventories. But a font or stoup which is always filled with water is a novelty. It was the strangest object seen by the members of the Cambrian Archæological Association this week. On Monday they visited the old church of Llanidan and, according to custom, the first object investigated was a stoup in the wall at the entrance to the church. This has the peculiarity of being always full of water without overflowing, and several explanations of the phenomenon are adduced. One is that the water trickles from the roof. Another, and the most generally accepted, is that the stoup is porous, and that the water reaches it by suction from a spring below. It has been testified by a servant man engaged for fifty-six years at Llanidan Hall that he only saw the stoup dry once, and that was for three days during a very dry summer. So much attention appears to have been given to the supply there was no question about the withdrawal of the water. Several able archæologists were present, but they could give no explanation of the phenomenon. Apparently it is a miniature water supply prepared by nature, and the wonder is that it was not utilised for other than ecclesiastical purposes.

It appears from the official report on the progress of the Ordnance Survey that the revision of the large-scale maps is being carried out, with the sanction of the Treasury, at a rate to insure that no part of Great Britain will have been unrevised for more than twenty years. With the recent completion of the fieldwork of the revision of the counties of Cornwall and Pembroke there is now no area which has not been brought within this category. The resurvey of Ireland on the 1:2500 scale is proceeding rapidly, the out-turn of the surveyors in 1906-7 having been about 1,231,360 acres, including 126,720 acres of the county of Dublin previously surveyed on that scale in 1863-7, which is now being revised in connection with the survey of adjoining counties. Maps on scales larger than the 25-inch are no longer made or revised in the ordinary course by the Ordnance Survey, except at the expense of the local authorities. The Survey does not owe much to civilians, for since its commencement it has been organised upon a military basis and carried out under military superintendence. The chief supervision, from the Director-General downwards, has been vested in officers selected from the corps of Royal Engineers. The 13th, 14th and 16th Companies of Royal Engineers were raised for the Ordnance Survey in 1824 and 1825, and the 19th Com-

pany was added in 1848. These companies were continuously employed on the Survey to March 31, 1906, when the establishment of survey companies was reduced from four to three, and the 16th Company ceased to exist as a survey company. The experience gained by the organisation can be turned to account in other ways, for three complete survey sections, composed of officers, non-commissioned officers and men of the Royal Engineers are held in readiness for service with an arm in the field, to carry out such surveys as may be considered necessary during the progress of a campaign.

THE King of the BELGIANS is a client who is enough to make many architects envious of M. CHARLES GIRAULT. As in many other cases, it is not necessary to inquire how the money has been obtained which His Majesty wishes to spend on architectural work. Various improvements are to be carried out both in Brussels and Ostend under the control of the French architect. A great Congo museum has been erected in Brussels, and two other buildings, no less imposing will be erected near it. One will be a college for the education of Belgians who will seek careers in the colonies. The other will be a building in which international congresses are to be held. One part of Brussels will therefore be transformed, to some extent solely at the expense of the King. The engagement of a French architect may not be satisfactory for the excellent artists of Belgium. But the King can point to the numerous countries throughout the world in which preference is given to French designs.

## ILLUSTRATIONS.

NEW GOVERNMENT OFFICES: FRONTS TO GREAT GEORGE STREET AND PARLIAMENT STREET.

WE publish this week another view of the Government offices which will soon be available for use by the Board of Education and the Local Government Board. The building was designed by the late Mr. J. M. BRYDON, and if he could have had opportunity for consideration he would no doubt have imparted greater effectiveness to the exterior. If regarded as an establishment where a large amount of clerical work has to be gone through daily, the building will no doubt serve its purpose. But when we remember the importance which education and local government have attained, something more imposing was expected. The realisation of the design was undertaken by the Office of Works, and the building has in consequence, it is said, become more efficient for business purposes. The contractors were MESSRS. SPENCER, SANTO & CO. and the large quantity of Portland stone used in the masonry was supplied by the Bath Stone Firms, Ltd.

EAST MASCALLS, SUSSEX.

RESIDENCE, BLACKROCK, BRIGHTON.

DESIGN FOR A PROVINCIAL CHURCH: EXTERIOR VIEW—VIEW OF CHANCEL.

THIS design was submitted for a church to serve about 750 people, and the main building was to be kept as cheap as consistent with proper dignity. The transepts were added as a means of obtaining a large area of seats. The end wall of the church was utilised for the side of the parish hall, classrooms and vestries, the corridor to which passes behind the reredos within the jambs of the east window, which is carried over the outer wall of the corridor. The parish hall would accommodate 350 persons. Red Bracknell bricks and Monk's Park stone were intended for the outside, with hand-made tiles for the main roofs and asphalt roofs over the aisles. The interior would be plastered, with the arcade and other internal stonework in Ancaster stone. The design is by Messrs. J. H. TYAS & ERNEST T. JAGO, A.R.I.B.A., 10 John Street, Adelphi.

## GERMAN ROMANESQUE.\*

THE revival of learning by Charlemagne brought Irish, Anglo-Saxon and Carolingian scribes in contact, and generally acknowledged that the term Franco-Saxon is only descriptive of the MSS. executed in the north of France and the Low Countries in the ninth century, of which the Bibles of Charles the Bald are the best known examples, so that a similar influence from the English is likely to be expected in the next century. Now if we examine the MSS. executed at New Minster and isolate details, we shall find several which are familiar to us at a later period. The New Minster at Winchester was founded by Alfred and put under the rule of the learned Grimbold for the purpose of educating the sons of the nobles. Grimbold had been in the monastery of St. Bertin, in Flanders, and entertained Alfred there when on a journey home in his youth. In 884 or 885 the king sent an embassy to Fulke, Archbishop of Reims, and the Abbot of St. Bertin, entreating their sanction to his coming. They sent a gift of wolfhounds. Fulke said he sent in a spiritual watch-dog to guard the Christian flock. He assigned an eighth of the revenues of his kingdom to support, and told his nobles either to study or resign their offices. He said his desire was "to provide houses of study, workshops for the writing and adornment of MSS., peaceful patterns of civic life, well-ordered communities resonant of labour and praise." A great school of illuminators was developed in the abbey, which produced some of the finest MSS. of the period in existence, among which may be mentioned the Benedictional of Ethelwold, written by Godemann, who became abbot of Exeter about 970, and the MS. in the library at Rouen, which is so much like it, and was probably written for the Benedictine abbot of Glastonbury, Ethelgar (965), who made Bishop of Selsey in 978 by Dunstan, and succeeded him as Archbishop of Canterbury in 988. Robert Norman was made Archbishop of Canterbury by Edward the Confessor, but was obliged to fly before the Danish indignation, and carried this Benedictional with him. In the register of Hyde Abbey (as New Minster was called when it was removed outside the walls) is a fragment of "exultet" with the musical scale in use before Guido of Arezzo invented the present gamut in 1020. It contains the name of several illuminators—Elsinus, Æthericus, and others, all Saxons. It was written for Ælfwine, who was then monk and deacon. He became abbot in 1035. In later Saxon times intercourse between England and the Continent was close and frequent. As early as the end of the eighth century an Englishman named Lul was established at Mainz to whom St. Cuthbert, abbot of Jarrow, was asking him to send experts in glassmaking. Carolingian culture had two principal centres, Tours and Alcuin of York planted in the school of Tours, and Northumbrian learning, and had pupils from nearly all the centres whence the first feeble struggles of Mediæval civilisation proceeded. Dr. Smith says in his dictionary of Christian Biography:—"Among the scholars in the palatine school of Charles himself with his sons Charles, Pipin and Louis, his sister Gisela and his daughter of the same name; Angilbert, afterwards Abbot of St. Riquier; Adalbert of Corvey; Rigbod, Archbishop of Trèves; Adis, a noble nun of Chelles; and Gundrada, sister to Adalbert. His most famous pupils during his later years were Rabanus Maurus, afterwards Archbishop of Mainz; Hatto, Abbot of Fulda; Haimo, Bishop of Halberstadt; Samuel, Abbot of Lorsch, and afterwards Bishop of Speyer; Adalbert, Abbot of Ferrières; Aldric, Bishop of Metz; and Amalanus, deacon of Metz." From the sixth to the eighth century missionaries went from Britain to Frisia, Germany, Switzerland, and even to Italy. The same decorative motifs are found in Ireland and in Switzerland, where Latin culture was preserved. The treasury of the principal church of Maeseyck, where the Gospels is preserved which dates from the eighth century, and has illuminations quite Anglo-Saxon in character, together with fragments of embroideries similar to those which were found in a shrine. They are the work of two nuns, sisters, named Erlinde and Relinde, and embroiderers, according to tradition, who brought their craft from Anglo-Saxon missionaries. As late as the Anglo-Saxon design exercised a certain amount of influence. The church of Petit Quévilly, near Rouen, has

been the subject of lectures by Mr. F. Hamilton Jackson, vice-president of the Society of Decorative Designers, and is the subject of the *Journal of the Society of Arts*.

painted decoration, said by M. Gonse to be of a rich, severe and delicate style of a curiously Anglo-Saxon character. St. Columba founded monasteries at Fontaine, Anagratum and Luxeuil at the end of the sixth century, and then Bobbio in Italy in 613. He also lived near Bregenz. St. Gall, the apostle of Switzerland, whose Irish name was Cellach, went thither at the beginning of the seventh century and founded his monastery in 614. St. Cataldo (Cathal), patron saint of Taranto, was a pilgrim Scot from Lismore in the seventh century. St. Donnat (Donncadh), his brother, was Bishop of Lupice, in Naples. St. Kilian, apostle and martyr of Franconia (689), is commemorated at Würzburg, where the MS. of the Gospels found in his tomb is annually exposed on the altar. At the monastery of Honangia, founded on an island in the Rhine near Strasburg by Tuban, an Irish bishop, a charter of 810 is preserved which recites grants to the monastery, the poor and pilgrim Scots. Nine Scots are named in it, eight of them bishops. There was a convent of Scots at Mount St. Victor, near Feldkirch, in the ninth century, and Dungal the Scot, author of the letter to Charlemagne on the eclipses of 810, became preceptor of the cathedral school at Pavia. Willibrord and Boniface, who came from Crediton, sought the conversion of Frisia and of central Germany in the first half of the eighth century, and they were accompanied and followed by a large number of Anglo-Saxon fellow-workers, SS. Lievin, Wilfred, Wigbert, Suitbert, Ewald, Willibald, nephew of Boniface, Wynnebald, &c. Willibrord founded Echternach before 739, and Suitbert founded Kaiserswerth. Fergal or Virgilius, an Irishman, was Bishop of Salzburg in the eighth century. The relics of British saints are revered in other continental places which commemorate their names, as St. Gobain near Laon, where the relics of St. Gobhan are enshrined above the high altar. In 856 Ethelwulf married Judith, daughter of Charles the Bald; Ogive, daughter of Edward the Elder, married Charles the Simple; Hedwig, Hugues the great Count of Paris; Edgiva, Louis the blind Count of Provence; Adela, Ebles Count of Poitiers. Another granddaughter of Alfred wedded Otho the Great of Saxony. At a later period the emperor was married to Chunelinde, daughter of Cnut; the Athelings, Edmund and Edward, had married nieces of the emperor, and German clerks were at the head of the Wessex church—so the channels for reciprocal artistic influence were open between the countries, and continued so, for in 1114 Henry V. of Germany married Matilda, daughter of Henry I. of England, who after his death in 1125 married Geoffrey Plantagenet, Count of Anjou, in 1129.

In every pattern there are two portions, the underlying curves or geometrical planning, and the details which disguise or emphasise the basis according to the fancy of the designer. Now the schemes of curvature of most of the Romanesque scrolls are simple and common to both later classical and Byzantine ornament. In this ivory vase from the British Museum, for instance, which is probably of Syrian manufacture, the curves might be of any period from the sixth century to the tenth, while the birds in the borders suggest Coptic influence, and the antique frets have developed into the riband pattern which we have seen at Moissac and Avalon. The heads in circles seem to be an earlier form of a detail frequent in Byzantine work of the tenth or eleventh century. Take next this strip of ornament from the cathedral, Verona, and compare it with this gold bracelet in the Franks Collection at the British Museum, said to be Egypto-Byzantine work, and the virtual identity of line and subject is apparent. But the plan lines are nearly the same as those from a vase in the Esquiline treasure, which we have seen repeated upon the Anglian crosses at Nunnykirk, Lancaster and Kendal, and similar curves form the bases of many of the late Roman mosaics of ornament both on vault and floor. In these panels from Torcello we have a modification of the same kind of curves, with foliage flowers in the centre and with animal forms introduced (as they are also in the Esquiline treasure); and animal forms playing through the scrolls are one of the characteristic details of Romanesque ornament. The heart-form as basis for ornament, so frequently used in German Romanesque especially, as in this late example from Gelnhausen, is Oriental, and the strap-like processes which enclose it are seen in early Saxon MS., while the flower in the centre is based upon Byzantine details. The elaborate interlacings of curves in the splendid initials of the German MSS. of the twelfth century are only developments of the same features used at Winchester and elsewhere long before.

In the Victoria and Albert Museum is a curious little carved oval box which is said to be Byzantine work of the

ninth century. If this ascription is correct, about which I have my doubts, though I cannot speak as an expert upon the matter, it is a very curious example of the early evolution of an ornamental form which is of frequent occurrence in the twelfth century. I mean the scroll flowers on the lid, which only require a slight scalloping at the edges to become quite like ornaments which are common in the MSS. of that period illuminated in Flanders and North-West Germany.

We have seen that the Comacines or Lombards had a great deal to do with spreading certain patterns round the basin of the Mediterranean, and that Lombards at a later date were the prime movers in the development of the architectural style termed Romanesque. Most of these masters were ecclesiastics of one kind or another, or at least worked under the shelter of the Church in which they had taken some kind of vows. The cloister was the only secure refuge for those who were not prepared to make fighting their principal business, and men of refinement who were peaceably disposed naturally gravitated to it. Here men of various nationalities met and could discuss problems which had arisen in following their various pursuits, for all those instructed at all spoke Latin, and learning progressed. Here was the great scriptorium where valuable books were written and illuminated; here were the workshops in which work in all kinds of materials was carried on; here were the masons, the designers, the carvers, enamellers, goldsmiths, mosaic-workers, painters, writers, joiners, and so forth—a busy hive of constant employment. The country was made to blossom and bear fruit, architectural and engineering works were carried out, and protection was afforded to all the vassals. The great Benedictine monastery, in fact, was the centre of all kinds of mental activity.

Take the history of St. Bernward as an instance of the life of such a master. He was born about 960, of a noble Saxon family, and brought by his maternal uncle, Deacon Folkmar, later Bishop of Utrecht, to the Hildesheim cathedral school, which was under the direction of Thangmar, schoolman, notary, librarian and dean at a later period. At that time the bishop's court of Hildesheim was the centre of culture of Eastphalia, embracing great variety of pursuits and also the practical use of mechanical arts. His biographer mentions that Bernward practised artistic writing, painting, working of metals, setting precious stones and architecture. Cloister workshops, schools and warehouses lay upon and around the cathedral hill. He was ordained exorcist and afterwards priest. He then went to his maternal grandfather, the Pfalzgraf Athalbero, and managed his affairs till he died in 987. He was then summoned to Court, and made tutor to the youthful Otho III. by the Empress Theophano. After her death he was made Bishop of Hildesheim, and consecrated in 993.

Thangmar gives us details of his daily occupations. Not only in Hildesheim, but in other places in the diocese he founded scriptoria for the production of liturgical, philosophical and theological literature. In the workshops painting and sculpture, goldsmith's work, mosaic and the laying of tiles by a process of his own were carried on. Talented youths accompanied him on his journeys to make drawings of notable things which he had not time to record himself and to study. He planned the church of St. Michael, Hildesheim, and most of it was carried out under his superintendence, though the fire of 1186 destroyed a good deal of his work. He made several crosses ornamented with filigree and pearls and with large crystals on the arms, a silver crucifix with the body arranged to hold relics, two gospel book-bindings and a paten with engraved panels of the cardinal virtues. Several MSS. in the treasury were written for him. In the Magdalen Church are two candlesticks of an alloy of silver and copper, formerly gilded. His celebrated doors were made for St. Michael's in 1015. He also made a column of bronze, 14 feet high, with reliefs from the Life of Christ in the manner of the Trajan column, and his grave-slab and sarcophagus, both of which Thangmar notes as being his own work.

Another example is Bishop Benno, of Osnabruck, who practised nearly as many different arts as St. Bernward. He first appears as a pupil, but soon acts as master builder at Hildesheim, then goes to Hungary with a host on account of a famine, finishes the building of castles left incomplete by Henry IV., then acts as viceroy for Archbishop Anno in the principality of Cologne. After he became Bishop of Osnabruck he drained the marshes, and became so celebrated as an hydraulic engineer that the emperor called him to Speyer to make the cathedral secure

from floods of the Rhine. At a later period he accompanied him on his journeys (carrying on his business operations by correspondence), and had artists with him to make drawings. Norbert, abbot of Iburg (1118) biographer, says that when he was building the monastery of Limburg, the cathedral of Speyer, which was finished in 1060, and the collegiate church of St. Guido in the same city, he established a school of architecture under the protection of the emperors, and that pupils came from all parts of the empire to give themselves with a will to the study of architecture.

The activity of these great men is astounding. They combined the practice of the architect, the founder, sculptor, painter, scribe, goldsmith, and even the organ builder. They were also teachers, theologians and sometimes physicists, statesmen and jurists. In England also ecclesiastics were often capable craftsmen. Leaving out St. Dunstan as a well-known, "who understood masonry, carpentry, smith's work; could draw, paint and design; was a musician, composer and maker of musical instruments as well as a distinguished ecclesiastic, let us take Ankerbute St. Albans, who was brought up as a goldsmith, and passed seven years in Denmark making things for the emperor and superintending the royal mint. Returning to England he became a professed brother of St. Albans, and made great feretrum, shrines for the relics of SS Bartholomew, Ignatius, Laurence and Nigasius, elaborate candlesticks, censers and incense boats.

The shrine of St. Thomas of Canterbury was made by the "that incomparable official," Walter of Colchester, who was assisted by Elias of Derby, a goldsmith of St. Albans, who was assisted by Elias of Derby, Canon of Salisbury. Three smiths "expert at shafts and at the making of iron" were mentioned by name among the monastic brethren. St. Patrick, and three skilful artificers. A bishop's shrine at Coula was St. Bridget's principal artist in gold, silver and other metals. When the same man worked in metal, he illuminated MSS. it was natural for the patterns sometimes counterchanged, and this may perhaps explain the genesis of the involved patterns known as Celtic. Mr. Romilly Allen says must have been copied by Celtic artists from the designs invented by pagan enamellers of late Celtic bronze bowls. Since all the bowls of this kind have been found in England, it is there that the spiral patterns of the MSS. must have originated, and not in Ireland. This theory is correct it will explain the perfection of the work and the certainty of hand in the earliest certainly dated with zoomorphic patterns, the Lindisfarne Gospels, which the elaborate interlacing patterns appear to have been derived from metalwork. St. Dageus, who lived in the sixth century and made many shrines, was an illuminator. St. Eloi made shrines of gold and silver to many saints, which his biographer enumerates, and was master of the mint to three French kings. The annalists of the ninth and tenth centuries mention a number of works of art, including metalwork, altars, made by monks.

Folcuin, in his *Life of Notger*, Bishop of Liège (971) describes a wonderful gospel ambo which he had made. "It was composed of a hollow formed of four half-cylinders set crosswise. The four faces of bronze, worked with hammer, were, according to the fancy of the artist, covered with chisellings and with gilding and held together by silvered uprights. On the north side the ambo had a reading-desk in the form of a cast eagle magnificently gilded, which raised its wings or extended them to support the gospel book. The neck moved by means of an ingenious mechanism—the bird appeared in some way to lift up the deacon's chant, breathing forth at the same time a cloud of perfumes produced by incense thrown upon braziers hidden inside the body." Villars de Honcourt describes such an eagle, and at Mainz there were two cranes which behaved in a similar manner. These mechanical pieces of furniture were probably suggested by the report of the splendour of the throne called "Solomon's" in the imperial palace at Constantinople, which was of gold encrusted with precious gems with mechanical birds which sang upon it: "above shone an immense cross encrusted with precious stones; around were golden seats for the imperial family. On the steps were two lions of gold, which roared to their feet, roaring. Thereby were golden trees, the branches of which birds of different kinds imitated the songs of those in the wild wood."

With craftsmen of such capacity within the monastery—with men of such varied powers directing affairs—the contact and friendly competition of the qualities of many nationalities, Eastern and Occidental, meeting

cosmopolitan cloister, and with varied and suggestive material brought to the door by commerce, either the spoils of ancient civilisations or the traditional products of the far ranging East, was formed a cradle in which the young Renaissance art was fostered, and from which it soon went forth in strength and splendour to pleasure the West with its beauty.

### SALISBURY CATHEDRAL.

THE members of the Hampshire Field Club and Archaeological Society last week visited Salisbury, and under the guidance of Mr. W. Dale, the hon. secretary, inspected the cathedral, the Bishop's palace, the museum and St. Thomas's Church.

At the north side of the cathedral Mr. Dale read a short paper. In the course of it he said he had brought them to Salisbury because, by common consent, it was there they had the best view of one of the most singularly beautiful cathedrals in the world. "The finest point of view is from the west," says Rickman, which was the best general view of a cathedral to be had in England, displaying the various beauties of this interesting building to the greatest advantage. "Externally," says Ferguson, "the effect of this cathedral is even better than that of the interior. The breaking of the outline by the two transepts, instead of cutting it up by buttresses and pinnacles, is a masterpiece of art, and its noble central tower, which, though erected at a later age, was evidently intended from the first, gives the whole composition with singular beauty." Welby, in, visiting Salisbury for the first time, arrived in the darkness of the night, and the next morning, as he opened a window overlooking the Close, he said, "I have travelled all over Europe, but have seen nothing like this." It was reserved, however, for no less an authority than Mr. Gladstone to indicate and express wherein the beauty of the exterior of Salisbury Cathedral lies. Speaking at a distribution of prizes at the Working Men's College, in Great Windmill Street, in 1893, Mr. Gladstone said:—"There is a circumstance in architecture which terrifies me, and that is a tendency which appears to prevail in modern domestic architecture—I refer to its redundant ornamentation. There are a great number of new buildings in London—I am not treading on anyone's toes—with regard to which, if you look at them, you will find that the architect has either a horror or a dread of leaving bare a single square foot of wall. Why do we not wage a war against the excess of ornamentation? Excess of ornamentation is, in all things, the most hostile to a due appreciation of proportion, because it is in proportion to the perception of breadth and beauty and line, and in the adjustment of lines to one another, that the essence of the art lies, and in that we will find the hope of attaining high excellence in great works. I will mention to you the case of the exterior of Salisbury Cathedral. The man who wants to know what beauty in stone, beauty not produced by ornamentation, should visit Salisbury, for there he will see less ornamentation on the exterior of the building than in any cathedral, I believe, in a great many domestic houses in London. If you want to see what can be done by simple beauty of outline, which is the foundation of all beauty, take a look at the exterior of Salisbury Cathedral. It is a model for all ages and all countries." The exceptional circumstance of the removal of the See from Old Sarum early in the thirteenth century was the cause of the comparative simplicity of the architecture. The cathedral was begun in 1220 and finished in all its essentials in 1258. Even in this early period a trained eye could notice an advance in style. When the central tower was added, the Early English style had blossomed into the Decorated, and in the western tower appeared the ball-flower ornament of the early part of the fourteenth century, which also was seen in the vault in Simnel Street, Southampton. It was on the west end they must look for the finest specimens of the Early English style. "It is at the east end," says Mr. Rickman, "that the refinement of the Early English style is carried to its culminating point, there being no moulding of any purpose and no enrichment without a cause. All the parts are so beautifully proportioned and so admirably used, that the critical eye seeks in vain for a suggestion to improve this most exquisite façade, which is certainly not equal in this country." The height of the spire is 404 feet. Amiens, the only cathedral which could compare with Salisbury, was 422 feet, but the great height of the nave at Amiens, 208 feet, did not make it appear so tall as Salisbury. Strasburg was 468 feet. Concerning

the workmanship, Professor Willis says:—"The regularity of the stones is astonishing; as soon as they had finished one part they copied it exactly in the next. The masonry runs in even bands, and you may follow it from the south transept eastward round to the north." They in Hampshire called to mind that Elias de Derham was the personal friend of Bishop Poore, and was also the architect of the great hall at Winchester, while Stephen Langton, whose figure was seen on the north side of the west front, assisted at the consecration of Salisbury Cathedral, and preached to the people on the following day. He must have touched the consecration crosses which were such a marked feature of the cathedral.

The visitors were met by Dr. Bourne, the treasurer of the cathedral, who conducted them round the building, pointing out the many objects of interest which escape the notice of the casual visitor. In the course of his remarks on the history of the cathedral, says the *Winchester Journal*, Dr. Bourne explained how it was that the building came to be erected on that spot. As they knew, for a long time the cathedral church of that diocese—the united diocese of Sherborne and Ramsbury—was at Old Sarum, which was a great and very important fortress, and the reason it was so unfit a place for a cathedral was that it was so very important for military purposes. There were constantly sieges of Old Sarum and blockades of the place, which was awkward, and meant that the place was always more or less in a state of disturbance. When the bishop wanted to hold a Confirmation or Ordination he found Old Sarum in a state of siege, and he could not get into his cathedral, or if he were in Old Sarum sometimes he could not get out, which was inconvenient for the purposes of the clergy and the carrying out of their work. Richard Poore, the founder of the cathedral, wanted very much to go to Wilton, but the Abbess of Wilton did not look at the matter from his point of view. She thought she and her ladies would be overshadowed by having a cathedral planted close to them, and she did all she could to prevent any land being transferred to the Church for the purpose of building there. The bishop had a small piece of property in his personal right, and in a sort of despair he said if he could not build the cathedral anywhere else he would build it on his own land. He called in the services of a Norfolk man, Elias de Derham, a member of the Chapter, and that he had a considerable knowledge of the work which he was asked to superintend might be gathered from the fact that he was responsible for the whole of the building with the exception of the spire. Elias de Derham drew the design of the building, and the bishop said it was very good, but a building of such size and importance could not stand on the ground on which they proposed to build the cathedral. The bishop knew to his cost that the land was a swamp, and he pointed out that if a building such as Elias de Derham had designed were erected without any foundations it could not stand. However, Elias de Derham explained that he was going to have his foundations above ground, and so he placed the bench on which the arches stood round the church. Dr. Bourne explained in detail the interesting monuments in the nave of the cathedral, and then conducted the party to the choir. He pointed out that one of the pillars was out of the perpendicular, and that even many years ago authorities were afraid the spire was going to fall to the north-east. As long ago as 200 years they took the exact measurement, and found that a plummet fell 23 inches to the north-east away from the south-west. But for 200 years the spire had not given way at all, and lately measures were taken which they hoped would make the church safe for some time to come. He had measured in the middle of a dry summer, and found that the water-line was only 33 inches below the surface, so they could imagine the difficulties which had to be contended with. This would probably account for the absence of any great number of vaults. He mentioned that tablets were to be seen in front of the communion rails recording the burial of a good many members of the Herbert family, and reminded his hearers of the lines:—

Underneath this sable hearse  
Lies the subject of all verse;  
Sidney's sister, Pembroke's mother.

He added that they knew the exact spot where she lay, and there was a tablet recording that below the stone lay Sidney's sister, Pembroke's mother. An object of great interest, the existence of which is unknown to many residents of Salisbury, is the remains of an old windlass on the north side of the choir, with a pulley, which was used formerly for rendering the veil which hung there during Holy Week hiding

the figure of Christ on the Cross. That was one of the ways in which the Mediæval Church, rightly or wrongly, tried to bring this before the eyes of the people, and that being a pre-Reformation rite, it was strange that it was allowed to remain. The only reason which he could suppose accounted for its remaining was that it was thought to be an apparatus for hauling up buckets of whitewash. After inspecting the nave the party visited the north chapel, and then, passing round behind the altar and down the south choir aisle, made their way to the chapter-house, the main features of which, with the representations of Biblical stories carved in stone on the walls, were also explained by Dr. Bourne.

On the conclusion of the tour of inspection, Mr. Hardy proposed a vote of thanks to Dr. Bourne for his interesting address and for the trouble he had taken to show them the principal features of that beautiful cathedral. The Society used to confine their excursions to Hampshire, but he thought it was wise that they should occasionally step over the border and visit a neighbouring county.

Dr. Bourne expressed the pleasure which it gave him to show the members of the Society over the cathedral.

Mr. A. R. Malden conducted the visitors over the palace, and much interest was shown in the fine collection of portraits of Bishops of Salisbury from the time of Bishop Jewel down to the present time.

At St. Thomas's Church the Rev. C. Ll. Sanctuary, the vicar, explained that the present church was not the original one. A church was built on that site in the thirteenth century, possibly as a chapel of ease to the cathedral. It might have been built to accommodate the workmen who were brought there to build the cathedral, and others who were attracted by the fact that a cathedral was to be built. It was also possible that there might have been an earlier church still on that spot, and if they looked in the north choir aisle they would see the bowl of an ancient font, as to the date of which they would probably be able to express an opinion. It was said that perhaps this font belonged to an earlier church in a small village by the river, while the cathedral and city of Old Sarum were up on the hill at Stratford. The present church was, of course, a fifteenth-century building. There were one or two things in the present church which undoubtedly existed before the main part of the building. For example, there was the tower, the exact date of which was not known, but which appeared to have been added to the thirteenth-century church some time after its original erection as a separate campanile, similar to the one at the cathedral, which was destroyed by Wyatt at the end of the eighteenth century. Other relics of the earlier church were the chancel arch and the spring of an arch now built into the wall between the choir and the south aisle. The whole of the church was practically rebuilt in the fifteenth century, and it was not known what brought about the rebuilding. Probably the old church was allowed to fall into decay, and its rebuilding was due to the munificence of the great merchants of Salisbury, which at that time was, as they knew, the centre of the wool trade. The vicar pointed out the many interesting features of the church, drawing particular attention to the merchants' marks in the south chapel, the carving of Humphrey Beckham, and to the fact that up to the fifteenth century there were chapels in the nave aisle as well as the choir aisles, which were served by chantry priests who were called chaplains and had dwellings in the churchyard.

#### ARCHITECTURE AND DRESS.

THE following apologue by Mr. Glenn Brown, architect and secretary of the American Institute of Architects, appears in the *Inland Architect*:—A striking commentary on modern architecture occurred at a recent fashionable evening reception. A craning of necks drew my attention to a man in faultless evening dress, startlingly transformed into an object of ridicule by a reflection in a mirror showing his back clothed in loose-fitting red flannel. He was hustled from the room by the floor committee. Following the curious crowd, I obtained the following novel idea on dress reform. I am infatuated with the modern system of design in our great commercial buildings, and see clearly its ready adaptability to modern dress. You have no doubt noticed how thoroughly our great architects have developed a style of great beauty for the front and economy for the rear. This innovation consists in building a front of precious stones and Classic design and erecting the side walls without form or order of cheap and ugly material. While the offensive sides are always visible, no one is foolish enough

to look at them. While the effect often destroys the beauty of a neighbourhood sensible people see only the beautiful front. This wonderful system saves the architect money and trouble, as he has only one façade to design. It saves the owner's purse, as he has only one front to build. The great architects of official Washington, cultured Boston, commercial New York and progressive Chicago zealously follow the system.

After mature consideration I have determined to adopt the same system with my clothes. I have rich material and elegant cut for my front and cheap material without form for my back. It saves fitting, study and goods. The elegant front will be enjoyed and the offensive rear will never shock an intelligent being. The system has so many advantages, I know all wise people will adopt the reform and follow the lead of the architects, the one profession which makes a study of beauty, fitness and harmony.

#### GREENWICH OBSERVATORY.

IN the course of his report to the Board of Visitors of the Royal Observatory, Greenwich, just issued, the Astronomer Royal (Sir W. H. M. Christie) says:—

"In view of the danger threatening the astronomical efficiency of the Observatory from the working of the generating station of the London County Council in the immediate future, to which attention was called in the report, a small committee, consisting of Lord Rosse, late Sir Benjamin Baker and Dr. Ewing, representing the Board of Visitors, the London County Council and the Admiralty respectively, was appointed in July to inquire into the question. In their report presented to Parliament they make definite recommendations as to the working of the generating station, and if these are all strictly carried out it may be hoped that the work of the Observatory will not be seriously interfered with, though further experiments when the generating station is completed and in full operation may modify this view. The recommendation of the committee that the question as to the effects of vibration on the discharge from chimneys should be further reviewed, say, two years is of great importance for the protection of the Observatory in the future. As regards vibration experiments made last summer showed that the vibrations from the engines of the completed portion of the generating station can be effectually damped out when the film of mercury in the amalgamated trough is as thin as paper. This condition of a very fine film had been previously secured for the Reflex-Zenith tube where the trough is a fixture, but special arrangements for leveling the trough have to be made in the case of an instrument which has to be reversed, and thus practical difficulties in longitude determinations are introduced through vibrations from the generating station. But though tremors which are undoubtedly caused by the generating station may be masked by the use of a very thin film of mercury, it is a question whether they do not cause the telescopes to oscillate to such an extent as to interfere with the delicate work of which they are capable, such as the observation of close double stars with the large telescopes. Further experience is required to decide this. The danger to be feared from the chimneys and the heated gases discharged in the immediate neighbourhood of the Greenwich meridian is more insidious, as the effect on the accuracy of observations of stars near the north horizon may become apparent in course of years when it is found that the results are untrustworthy from this cause. The recommendations of the committee in this respect represent a minimum which is absolutely necessary, and a further reduction in the height of the chimneys may be required to safeguard the Greenwich meridian work."

#### YORK MINSTER.

YORK MINSTER is at present undergoing a "spring cleaning." All the interior walls are being brushed down, and the dust, which will accumulate on every ledge and projection, is being removed. This task, says the *Yorkshire Herald*, will take a considerable time, probably some weeks, and then, if the Dean and Chapter so decide, the numerous precious monuments will undergo a cleaning process—a work which has to be carried out with the very greatest care lest permanent injury instead of benefit, should result.

Spring cleaning has the merit sometimes of bringing to light bits of carving hitherto unsuspected. Queer figures

and lovely floral designs exist in obscure and almost inaccessible places, where some Mediæval craftsman wrought the best for the sake of the religion that was in him and the art that he loved, without expecting or receiving any applause for his labours. These are revealed only to the eyes of the men who do the cleaning, and to the officials of the Minster whose business it is to explore every nook and cranny.

An American architect who has travelled over the Old World for the purpose of inspecting all the famous buildings arrived in York only a few weeks ago to visit the Minster. With the thoroughness of a professional he went all over the place, paying strict attention to just those secluded corners and places already mentioned, where unimpeded work, if there be any, is certain to be found. His verdict, given to a friend of the writer of these lines, was terse but pregnant. "Well, this place was finished." Asked for an explanation, he remarked that of all the cathedrals and famous buildings he had examined during his tour he had not seen one that exhibited such conscientious work even in places never intended to come under the public eye. York Minster was perfectly built and finished to its remotest corner. By the way, the visitor added that picture postcards of York Minster could be purchased in almost any city in America.

Work on the central tower is progressing satisfactorily. The parapet has been removed from three sides, and will be entirely replaced by new stone. On the fourth a bodily removal is not necessary, but restoration will be carried out.

On the famous "Five Sisters Window" work has been in progress for some weeks. As the Dean has pointed out, the strong iron stanchions, contracting and expanding under the changes of temperature in the atmosphere, have broken the thick plates of glass put up years ago for its protection, and materially cracked and injured the stonework. These are being carefully repaired, and an outer covering of plain white glass in quarries with lead glazing is being substituted for the present thick green plates. This desirable improvement, which the donation of 200*l.* from the Duke of Westminster made possible, has to be made very carefully, as if the ancient painted glass were exposed to a strong wind it might be wrecked beyond repair.

The question now arises, Will the work of restoration be stopped owing to lack of money? Funds are very low, and already it is hinted that a few weeks may see a cessation of labour. The rebuilding of Selby Abbey has, for a time at least, diverted subscriptions from York Minster. No one grudges the help being given to Selby, least of all the Minster authorities. The Dean, with the sublime confidence of one who has grown old in the faith, is assured that the money will come in God's good time; others, not so patient and calm, feel that another appeal should be issued—an appeal not merely to Church-people, but to all who treasure these grand old possessions of the Church and people. Money certainly must be secured soon if the work is not to stop.

### A CELTIC VISION OF BUILDING.

THE following remarkable epistle has been sent by Professor Patrick Geddes, of Edinburgh University, Mr. D. Llewellyn Thomas, the honorary secretary of the Llandudno Section Meetings of the Swansea Eisteddfod.

I am sincerely sorry that my engagements make it impossible for me to accept your invitation, for I should wish to be present on many grounds, and two specially.

First, of course, as a loyal well-wisher to Garden City and to support its excellent working chief, Mr. Williams, his insistence upon it as an example—one soon to be followed throughout the length and breadth of the land, and led throughout the industrial world.

But there is a second and more intimate reason. At our approaching Pan-Celtic Congress in Edinburgh we hope to receive your bardic Gorsedd around the "Lia Fáil." And in the section of Celtic art, for which I am open to be personally responsible, we shall welcome your Celtic music and idealistic poetry as its most highly developed and also most diffused and completely national expression—one developed beyond our Highland pipe and dance and nationalised beyond the Irish saga and drama. And now, in Welsh Eisteddfod, or Irish Feis, or Highland Games assembled, and still more in common conference and gathering, may we not do something for that great art problem which is again rising before the world, the supreme

material art of architecture? What do housing congresses and garden cities mean? What use can they be? What hope is for them? Unless we are again truly at the opening of one of those great constructive movements, which the world has too rarely seen, but by whose monuments it dates the eras of its civilisation? In the great temples, the cathedrals, the builders toiled for the gods alone, and from the Pyramids to the palaces of every age they have laboured for their kings, their lords, their masters. Little wonder, then, that they have degenerated till the very word "builder," once so honourable, reeks of the slum he builds, and this profitably only to its landlords or their legal and usurer parasites.

But now we are beginning to take heart anew. Let us say then, now and henceforth, we shall build cities for ourselves, homes fit for sweethearts and wives, for mothers, and, above all, for children, where they shall no longer grow up rough, yet pale, hooligans and streetkins, but into men and women once more, with the rustic health and colour, simplicity and strength, yet with all that is best in urban culture also: homes with the country life cleared of its limitations, with the city life cleansed of its evils.

The student of history, that most Celtic of the sciences, constantly discloses to us how the historic foundations which were the glory of our cities, their ancient centres of defence, their sacred hermitages and shrines, even their later churches and cathedrals, are most frequently of Celtic origin. But, alas! to the social observer of to-day, the Celt as sociologist, throughout the towns and cities of the Anglo-Celtic world, on both sides of the Atlantic, it is plainly the Celtic quarters in which the miseries and the evils of town life most abound; also disease, vice, folly and crime together. From the slum of ruined and expatriated peoples to the den of Tammany and its boss our city evils are profoundly the waste products of the ruined, debased and demoralised Celtic order, chieftains and clans decayed together. Yet, happily, the heroes who are now attacking all these evils, the temperance advocate or the missionary, the teacher and the reformer, the better journalist and the statesman, are again conspicuously also of Celtic name or blood. So, too, are the painter and the sculptor, the singer, the musician and the poet, the idealist and dreamer above all.

And let us avoid that dull satisfaction with small betterments, with mere comfort, with which the utilitarian and Saxon part in us is too readily content, and not merely to improve city conditions a little, as a sort of smoke-abatement society or window-box association may do (though all these are well), but set before us the transformation of our towns, their transfiguration rather, until we see, in literal and material everyday reality, beauty for ashes.

We call this the age of industry, and we realise its wonders as the most deep and thorough transformation of human powers and possibilities, both for good and evil, and for evil so far as not for good, since man first grasped the flint—a tool henceforward—and struck from it also the first sparks of fire. In this old Stone Age the archæologist has taught us to distinguish two distinct periods—the rude Stone Age and the fine, the palæolithic and the neolithic. The first was that of a rude and individualistic people, hunting, predatory, warlike; the second that of a gentler because also higher brained folk, with polished implements, better dwellings, and with a better use for land also, that of agriculture—indeed, horticulture rather—not mere hunt and sport and war. With agriculture, with better housing, there was a far higher status of women, there were no mean beginnings of art, and, it would seem, even of a religion beyond mere fears.

May we not now apply this anew to our own times in their turn, and see in our modern industrial or technical age periods also, rude and fine—the palæotechnic and the neotechnic let us frankly call them. In the first stage men get up coal to run machinery to produce cheap products, to maintain more people, to get up more coal, to run more machinery, to produce more cheap products still, with yet more people, too, cheap in every sense as well. And their fetish-men—the palæotechnic economists—called this "Progress." But we are also passing into a higher stage—the neotechnic one—characterised by the increasingly economic utilisation of the energies of nature, and this towards more human and more social ends, not only for the maintenance and the multiplication of the community at a low standard, but for its evolution also, for the extension of the individual life and powers. It is a social process characterised no longer mainly by steam but rather by electricity, no longer by vulgarity for the rich and squalor for the poor but by

art, by hygiene for all—hygiene, too, just beginning to be understood, not merely or mainly as a mere riddance of the lowest forms of life, which was against the higher, but as an association with the higher and more beautiful forms of life, whose care has so largely evolved all that is highest in us. Such hygiene, again, personifies health, but no longer merely as a plumber, an engineer, a doctor at best, but as a returning goddess—a realisable ideal as goodness and beauty incarnate in women once more.

This outlook, then, is no "merely sentimental" or "æsthetic" one, as the outworn jeering has it—jeering, for the most part, of those interested in obtaining the present individual chaos, but a definite and a demonstrable theory of the present progress of our civilisation, a transition and a conflict in which we may take an increasing part, and one soon consciously to regroup all men anew into two main parties, those of the dying palæotechnic past, the opening neotechnic future.

Is not this, then, a legitimate and an urgent appeal to Celtic idealism? With Amphion's harp and song the Hellenic cities arose of old. Why not now in our day the Cymric ones? Of this harp and song we Celts—you Welsh, of course, especially—claim the direct inheritance; we Gaels perhaps rather that of his constructive art, his architectural dream. You know how the Saxon folk-tale begins with "Once upon a time," but the Gaelic, "It was when Beauty, the daughter of the King of Greece, came to Erin," to "Alban." Yet, as we know, though she brought to us alike the harp, it was to you especially she taught her song.

So once more to this song let Cymric, Gaelic cities rise and throw off their present disguise of foul enchantments. Have done, then, with Welsh towns as they are and on to what they may be.

#### AN ILLICIT COMMISSION.

A CORRESPONDENT of the *Chicago Tribune* relates the following story of the late Mr. W. L. B. Jenney:—

One day Jenney was in his private office when a man who wanted to provide certain materials for a building then under construction came in and approached John Ewen, then a "cub" in Jenney's office, with a flagrant bribe offer. He offered Mr. Ewen 50 dols. if his material was used.

Mr. Ewen was seized with an inspiration. Instead of throwing the man out of the office, he said, "Mr. Jenney always handles that end of the business. Go in and see him." Then he awaited the explosion.

The man innocently approached Mr. Jenney and made the proposition.

"Sit down a moment," said Jenney quietly. A moment later he looked up and said, "Young man, are you new in the business?"

"Yes, sir. I'm just starting. I want to get in right. My stuff is good and I want a chance."

"Well," said Mr. Jenney, "there are two ways to do business. If you want to do the best kind of business with the best firms, don't do as you have done to-day. I have no doubt that is the way to do business with some firms. If you are after that class of business that is the proper way to get it. But if you want the best business don't approach any one as you have me. I'll give you the contract at your figures. If you can afford to give me 50 dols., you can afford to knock 50 dols. off the price to the owner. Let's reduce your figures 50 dols. and give the builder the benefit."

The man agreed. He learned his lesson well, and he did business with Mr. Jenney for years. When Mr. Jenney died this man testified that it was that one business lesson that made him realise that the only way to do business is to do it straight.

When Mr. Jenney dismissed the man that day after signing agreements he stepped out smiling to Ewen and remarked, "Thought you'd have some fun with me, eh?"

Another and severer lesson he administered to a big contractor down town. This man was prominent socially, financially and in religious circles, and through Jenney he got the contract for a skyscraper down town. One day, while the business was in course of construction, he entered Mr. Jenney's office and handed him a cheque.

"What's this for?" asked Mr. Jenney.

"It's the usual 10 per cent. of the first payment—your share," he added significantly.

Mr. Jenney took the cheque, chatted for a time with the man, and finally went out into the workroom.

"What is the amount of that contract?" he asked Mundie, his partner.

Mundie told him.

Jenney figured for a moment, muttered, "Yes, amount is correct," and then returned to his private office and endorsed the cheque over to the owner of the building.

Nothing more was heard of the matter until the end of the month, when the crooked contractor received from bank a cheque endorsed both by Mr. Jenney and the owner of the building.

There was nothing for him to do but to take his medicine. He appeared in Jenney's office, probably expecting to be flayed for his tactics, but nothing of that sort happened. Mr. Jenney remarked:—

"I am extremely glad to know that you can afford to make the lowest bid on a building and give the owner 10 per cent. back and still make money on it; but don't think it would be more businesslike just to subtract 10 per cent. from the total contract price and save all this red tape of sending the cheque to me and having me endorse it to the owner?"

The contractor humbly admitted that it was.

There was not a word of condemnation or reproof, only a few who learned of it from the owner ever knew of the occurrence.

Mr. Jenney did not cast out that contractor, but continued to do business with him. And when Mr. Jenney built his own home he gave a contract for part of the material to that man—and the man skinned him.

#### CHILLINGHAM CASTLE.

THE most popular outdoor meeting during this year was the Architectural and Archaeological Society of Chillingham and Northumberland was held last week, when upwards of 100 ladies and gentlemen took part in a visit to Chillingham and Old Bewick. The Society had the great advantage resulting from the presence amongst them during the day of Sir Henry Howorth, president of the British Archaeological Society.

At Chillingham the castle was inspected through the kindness of Mr. Saxton Noble. In a few explanatory remarks, says the *Durham Advertiser*, Mr. Knowles stated that a castle was built in the fourteenth century. In the thirteenth century a number of palatial mansions were built by feudal lords of the same character as that. The same character of building was met with at Ford, and in Yorkshire at Bolton and Middleham. The castle was said to have been built from designs by Inigo Jones. The historical pictures were pointed out to the visitors.

Sir Henry Howorth, on being invited to speak, said he had always been to him a wish that he should see Chillingham in a wonderful place. He doubted whether there was any other castle so widely known all over the country—by name as well as in all events—as Chillingham, partly because of its own beauty and also because it contained the last of the great herds of these ancient wild cattle, the history of which was so romantic. He should like to say a word about the singular facts connected with these castellated houses. The notion that when the Normans landed in this country that the built stone houses was now completely exploded. The castles built by them in Normandy were made of wood. After landing in this country the only stone castles built by them were three or four royal castles, specially built by William the Conqueror to protect special places. All the rest of the castles were staked forts made of wood. So it went on for some time. The reason why they became more or less impossible was because they were liable to be burnt. Early chroniclers always spoke of castles being burnt. After castles came to be built of stone, they formed large courtyards, and in the Middle Ages there were, he believed, a hundred and twenty houses stabled in that at Chillingham. In the county of Northumberland it seemed a matter of amazement that, situated so near Scotland, there should have grown up a great number of manor-houses with no defence at all. They were called mansions in the early records. In Stephen's reign and Henry I. and his son's time, the nobles were prevented from building any more castles. It was shown after the tremendous battle of Neville's Cross that Edward knew that the North country was subject to the attacks from Scotland, and that he could not protect them, he gave permission for the aristocracy to embattle their houses. In the next forty years almost every large house became an embattled house. Chillingham Castle was a grand one.

ttled mansion. It was connected with the extraordinary family, the Greys. The Greys and an Oxford family were probably more mixed up with the history of England from the end of the fourteenth century than any other great feudal family. The portraits in Chillingham Castle were of extraordinary interest. There was a magnificent portrait by Sir G. Kneller of Judge Jeffries in Lord Chancellor's robes. It was the portrait of a Lord Chancellor, but he was exceedingly doubtful that it was Lord Jeffries. It seemed impossible to associate with a face such as they saw the deeds of Judge Jeffries.

Subsequently Chillingham Church was visited. It is principally thirteenth-century work, and has a Norman doorway. The feature of the building is, however, an elaborate monument of Sir Ralph Grey and Elizabeth Fitz-Hugh, his wife. This is stated to be the finest altar tomb in Northumberland.

## TEACHING OF DRAWING.

A PAPER issued by the Scotch Education Department on the teaching of various school subjects deals with drawing. It points out that the careful study of more or less complete representation of actual objects, natural and fashioned, large and small, singly and in well-arranged groups, may be looked upon as the foundation of all primary school drawing instruction. The intelligent arrangement and carrying on of this work and of the various correlations and developments which naturally arise from it at all points are problems which have to be faced by the majority of primary school teachers. A well-conceived scheme of drawing instruction intelligently carried out in correlation with a course of true nature study, with which it is naturally allied, should gradually awaken the pupils' interest and delight in the world which surrounds them, instilling an appreciation and love of beauty in form, colour, material and arrangement, as well as a regard for utility. It should cultivate in them habits of accurate observation, and the power to represent faithfully and truly in different mediums the results of their observations, so that through practice they may gradually gain facility in graphic and plastic representation—the language of hand and eye. Along with these it should develop their inventive and imaginative faculties, and create a taste for graceful form, fine colour, sound decoration and harmonious arrangement in their own homes and surroundings.

From the very beginning the child should be encouraged to observe on his own account, and to record the results of his observations with as much accuracy as he is capable of. Nothing should ever be interposed between him and what he is representing. He should always feel that he is recording his own impressions of something real and not those of anyone else, however accomplished. The memorandum goes fully into the means of developing the artistic talents of the young, advocating modelling in clay, memory and imaginative drawing with coloured crayons, pencil and washwork, colour renderings, nature study, &c. Public parks and gardens are recommended as capable of supplying a large amount of material very suitable for school purposes, and visits to art galleries or museums are advocated.

## BOMBAY ARCHITECTS.

AT the first general meeting of the Bombay Architects' Association, held on July 29, it was resolved to appeal to the president of the corporation not to pass the building by-laws proposed by the municipal executive until the Association has been given an opportunity of examining and advising in reference to them. How the by-laws will affect the professional duties of the engineers was graphically set forth by the President in his opening speech. From the number of buildings that now and then collapse in Bombay, he might imagine that building operations were subject to very little control. The rules providing for the municipal control may be defective, and the way in which those rules are enforced is perhaps still more open to criticism. But the duties of the engineers are even now onerous. As Mr. W. A. Chambers remarked in his speech at the general meeting of the Architects' Association:—"There probably is no city where building operations are so watched as here. Before the smallest house can be erected plans must be prepared by an engineer, licensed by the local municipality; these plans have to be sanctioned or criticised by the municipal executive engineer, the health officer, the drainage engineer, the house improvement

branch (under the Epidemic Diseases Act), and sometimes by the municipal commissioner. During its construction, officials representing each of these authorities watch its erection, and finally the architect has to certify that all materials used are good, and that no municipal regulation or requisition has been broken. If the building should stand on ground belonging to the Bombay Improvement Trust, not only have the authorities just mentioned to be consulted, but, in addition, the chairman of the Trust, the engineer of the Trust, the trustees themselves, and occasionally the Government architect, have a control in its design and erection. The unfortunate architect has thus no easy task, and when, as is often the case, he has a client who does not see the advantage of all these authorities, his position is not exactly a pleasant one."

## INTERNATIONAL DRAWING CONGRESS.

FURTHER progress was made at a recent committee meeting with the arrangements for the international drawing congress, to be held in London next year. The congress is to be held from August 3 to August 8, 1908. The congress exhibition will probably be opened about a week earlier. It will certainly remain open after August 8. Official invitations are to be sent to all foreign Governments through the Foreign Office. All exhibits intended for the exhibition must be sent in by June 1, 1908. All papers for the congress must be sent in by May 1, 1908; they may be written in English, French or German. The congress will sit as a whole, except on one day, which will be devoted to sectional meetings. Arrangements will be made whereby such subjects as may be desired by a sufficient number of members of the congress shall be discussed on the sectional day. So far as possible, the exhibits of the various nations will be in charge of representatives who can explain their scope and purport in the three official languages of the congress—English, French and German. Local treasurers and secretaries are to be appointed in all foreign countries, the former to collect and transmit membership subscriptions, and the latter to disseminate information and answer inquiries. Such officers have already been appointed for France, Germany and the United States. The United States are making arrangements for sending 200 art teachers over to attend the congress. With regard to Great Britain, local exhibitions will be organised throughout the country, from which exhibits for the congress exhibition can be chosen. Any further information can be obtained from the organising secretary of the congress, Mr. C. M. Mathews, 151 Cannon Street, E.C.

## VICTORIA AND ALBERT MUSEUM.

THE Board of Education have decided that from January 1, 1908, the South Kensington Museum shall be open free till 10 P.M. on Thursdays, instead of on Tuesdays as at present.

From that date the regulations for admission to the museum will be as follows:—

On Mondays, Thursdays and Saturdays the museum is open free from 10 A.M. till 10 P.M., except that on these days admission to the libraries is by ticket only (for rates see below).

On Tuesdays, Wednesdays and Fridays the museum is open from 10 A.M. till 4 P.M. in January, November and December, till 5 P.M. in February and October, and until 6 P.M. from March to September inclusive. On these days, being students' days, a charge of 6d. for admission to the main building is made for each person other than ticket-holders, but the museum buildings, except the science library, to the west of Exhibition Road are open free every day.

On Sundays the museum (except the libraries) is open free from 2 P.M. till 4 P.M. in January, November and December, till 5 P.M. in February and October, till 6 P.M. in March, April and September, and until 7 P.M. in May to August inclusive.

The libraries are not open on Sundays, but are open on week-days during the same hours as the rest of the museum.

On Good Friday and Christmas Day the museum is not open.

Tickets of admission to the museum (including the libraries) can be obtained at the main entrance of the museum at the following rates:—Weekly, 6d.; monthly, 1s. 6d.; quarterly, 3s.; yearly, 10s. All visitors who have paid on entrance and all ticket-holders are entitled to admission to the libraries.

### The "Noise Fiend" of the Metropolis.

SIR,—One cannot but wonder whether it is the dense ignorance, the utter indifference, or the crass and absolute inefficiency of the authorities responsible for the government of London that allows the noise fiend to sway his sceptre over it so unmercifully as at present and that causes the "Metropolis of the World" to lag so far behind other cities in the matter of reasonable law and order. Professor Flinders Petrie, F.R.S., has observed that "the first use of a city is to live and transact business in," that "the beauty of a city lies in its order and liveableness," and that "the sacrifice of this peaceable liberty of the many to the tyranny of the noisy is what all serious workers should join in resisting."

A statement recently appeared in the Press to the effect that the depreciation in the value of house property in London during the past two years amounted to no less than 6,000,000*l.* How long is this depreciation to be allowed to continue? There are, however, various other aspects of the question besides the financial one. For instance, not only are the peace and "liveableness" of the Metropolis departing from it by rapid strides, but the health of London is being seriously impaired and the enjoyment of life marred by the altogether unreasonable din and clatter allowed to prevail in most of our leading thoroughfares. Are we—with our hands to our ears—tamely to submit to this pandemonium as an inevitable result of the "march of progress," and one which must be endured for the remainder of our lives? Are we to rest content with being informed (I hear it almost hourly) that "nothing can be expected from the present Government"?

It seems to me that the Home Office, Board of Trade, L.C.C., and other officials should be somewhat forcibly informed that the time has arrived when they must either do something themselves to remedy the present deplorable state of things, or make way for others who will not treat with indifference the wishes of millions of people. Suggestions are plentiful—a Royal Commission, a Minister for London, a traffic board, an up-to-date Act of Parliament, common sense by-laws, noise "inspectors," a more efficient police system. Surely some of these would lead to the utter discomfiture, if not the prompt annihilation, of the noise fiend, so that London's work and art and thought might be carried on under more satisfactory conditions than at present prevail, including a reasonable freedom from harmful nerve shocks, and from the pitiless din, clamour, babel and uproar that now disgrace the streets of London and are rapidly driving its residents elsewhere.—Yours obediently,

THOMAS BOWDEN GREEN.

2 Harrington Gardens, South Kensington, S.W.

### GENERAL.

**MM. Jean Girette and Eugène Bertrand** have been placed first in the competition for the Government buildings to be erected in Sofia, the capital of Bulgaria.

**The International Society of Sculptors, Painters and Gravers** are opening a series of important exhibitions of the British section of its members in Berlin in October, from which city the exhibition goes on to Düsseldorf, proceeding thence to the Royal Academy of Dresden. Among those who will exhibit are Messrs. John Lavery, E. A. Walton, Joseph Pennell, H. Wilson, C. H. Shannon, Francis Howard, William Strong, Charles Ricketts, Walter Crane, J. J. Shannon, Sir Charles Holroyd, Grosvenor Thomas, R. Anning Bell, A. Roche and A. D. Peppercorn. It is hoped that the German Emperor will open the exhibition in Berlin.

**The Tower of St. Gennys Church**, situated between Bude and Boscastle on the North Cornish coast, being in a dilapidated condition, a fete was organised in the vicarage garden last week to raise funds for its restoration. The tower is Norman, and is supposed to be the oldest in Cornwall. Mr. E. Sedding, F.R.I.B.A., estimates the cost of restoration to be about 350*l.*, of which about 100*l.* has been raised. The vicar and parishioners appeal to all lovers of Norman architecture to help them in carrying out a really good restoration.

**Mr. A. Wylie**, electrical engineer to the Walsall Corporation, has tendered his resignation on obtaining a similar appointment at Auckland, in New Zealand. Mr. Wylie whose salary in Walsall was 500*l.* per annum, has been in charge of the Walsall electricity undertaking since its inception about twelve years ago.

**The Scheme** for the restoration of Bowden Kirk, one of the oldest and most interesting historically in Scotland, will cost about 2,000*l.* The church was built in 1128, and is older than Melrose or Dryburgh abbeys, and it has been continuously used for religious service ever since. The work of restoration has been put into the hands of Mr. M'Gregor Chalmers, Glasgow. The old lines of the original building are to be followed closely. The south wall, which was rebuilt in 1798, is to be restored as nearly as possible to its original state, the windows being rounded at the top. The high east end, a distinct feature of the church and almost unique in Scotland, is to be retained. Internally the church is to be entirely remodelled and renewed. The Duke of Roxburghe has consented to the inclusion of the space above his family burial vault within the area of the restored church. A chancel is also to be formed and a large chancel arch erected. The ceiling will be vaulted and the furnishings will be of oak.

**During the Excavations** in the bed of the river in connection with the Newport (Isle of Wight) Quay extension works, a bronze coin was discovered some distance from the shore of the reign of the Emperor Constantius I., who flourished at the beginning of the fourth century, and who fought for the possession of Britain, and who died at Eboracum (York). The coin is in an excellent state of preservation, notwithstanding that it is some 1,500 years old. Many remains of trees of considerable size have been unearthed, and there are also remains of rough planks which had been driven in many years ago. One of the submerged trees measured 2½ feet thick.

**Major J. Stewart, R.E.**, sat at the town hall, Newport last week, to inquire into the proposals of the Newport Corporation to borrow a further sum of 4,500*l.* for purposes of their lunatic asylum at Caerleon. Mr. A. A. Newman, town clerk, explained that the total amount expended on the asylum was 159,500*l.* There had been no extravagance and they had a cheap institution. They had under-estimated some amounts and required another 4,500*l.* The question was would the amount be chargeable to capital? The formation of roads and drains had not been taken sufficient into account by the committee. The airing courts had cost 2,692*l.* more than was estimated in the first instance. Fees for architect, surveyor, clerk of works, &c., had cost 1,630*l.* more than estimated. They allocated 110,000*l.* to the buildings, but they cost 112,073*l.*—an increase of 2,073*l.* There was a saving on furniture and equipment of 2,575*l.*, and other items.

**Mr. Lloyd-George**, in answer to Sir J. Dickson-Poynder, M.P. for Chippenham, said the new Traffic Department of the Board of Trade would have no power to compel promoters of new schemes for London locomotion to submit them for preliminary examination before the deposit of Bills, unless this should be required hereafter by an alteration of Standing Orders. In the meantime he did not anticipate that the absence of compulsory powers, either in this matter or the taking of evidence, would seriously interfere with the work of preliminary examination.

**We Lately Commented** on the strange proceedings of the Acton Council respecting the design for offices. A new competition has been announced. Intending competitors should be aware that, upon representations made to them by the Board of Professional Defence, the competition committee of the Royal Institute of British Architects have decided that this competition is one in which members of the Institute must not take part.

**The Scheme** of evening class work in the department of architecture at University College, London, has been rearranged and revised in order to meet the needs of those who have already made some progress in their work in architects' offices. Next year the scheme of work will include a course of lectures on "English Mediæval Architecture," by Mr. Edward S. Prior, M.A., F.R.I.B.A., and a junior and senior design class, which will be carried out under the supervision of Professor Simpson and Mr. Cyril E. Power, with the assistance of Mr. Leonard Stokes, F.R.I.B.A., and Mr. Ernest Newton, F.R.I.B.A., as special visitors.

# The Architect.

## THE WEEK.

Architects have sometimes to show their interest in a company by investing money in shares. That is generally of a professional kind, for the investment is supposed to facilitate the appointment to office or to give a claim for consultation, references or work. As in other matters, it is well that the object of the investment should be distinctly understood. Last week before the Court of Session in Edinburgh the liquidator of the National House Property Investment Company, of Bristol, sought to recover from Messrs. M'ARTHY & WATSON 87*l.* 10*s.*—the balance on 100 shares on which a deposit of 2*s.* 6*d.* had been paid. The company had been wound up irregularly. The defendants denied they were members of the company, for their applications were based on a distinct understanding of becoming surrogates to the company over an average radius of 100 miles from Edinburgh; secondly, that they were appointed advisory surveyors to the Advisory Board for Scotland at fees to be adjusted; and that they were at liberty to pay the balance of the shares owing the fees to be earned by them to accumulate for a particular purpose. They maintained that the conditions were not fulfilled and that the contract was not enforceable. Fortunately for Messrs. M'ARTHY & WATSON the conditions were expressed in writing, and Lord MacNair, who heard the case, decided in their favour. His Lordship considered that a condition precedent had been established; they acted rightly in declining to pay the money due on allotment. The company was engaged in a business that the architects would have any reasonable interest in it.

In a week two more acts of vandalism have been perpetrated in the Louvre. A landscape by Delacroix and a portrait by Ingres have been injured. It is believed that the culprits were youths, two boys and a girl. For weak minds there is a fascination in acts of violence which are not commonplace, and greater care will have to be taken in watching the galleries. But at the same time the expenditure on the army does not allow of employing guardians, although they may not be at a higher rate than policemen. Besides, pictures of the 19th century are not adapted to gain effect for large galleries; they have to be shown in ante-chambers, where visitors are few and do not remain long in study. At least, and until the insanity is diminished, it is a course to adopt would be to seek the aid of a few guardians, of whom it may be assumed a large number would be forthcoming in Paris.

Alexander Thomson Studentship is again open to the competition of architectural students of the ages of nineteen and twenty-eight. In a way it differs from most of those competitions in that it is for memorials of architects. THOMSON merits to be mentioned on the same plane as POELAERT, the Belgian, who made the bravest effort to adapt Greek architecture to modern needs. THOMSON was not allowed to build the colossal Palais de Justice, and his principal work was a church in Glasgow, but it is sufficient to his credit that it inspired him and his love for architecture. It should be considered as a privilege to have the memory of such an architect, and in the competition should be entered upon. The subject assigned is a city church, including vestries, a church-hall, a school, kitchen and caretaker's house, and also a house of ten apartments. The site is supposed to be 350 feet by 250 feet, with roads on

three sides 80 feet wide and an open space of 200 feet in front. The buildings are to be Classic in style. Besides the prescribed drawings each competitor is also to submit three studies of the Classic Orders, at least one having the shadows carefully projected, or a study of a Classic building showing the Orders. A drawing from the round, shaded from the antique, either figure or ornament, and two sheets of architectural sketches, preferably not executed specially for this competition. The drawings are to be sent in to Mr. C. J. MACLEAN, the secretary, in Glasgow, on December 28, 1908. The trustees who will decide are the Council of the Glasgow Institute of Architects and Mr. JOHN SHIELDS, measurer. The prizes, we hope, will be well contested, for the competition is of a kind to test a student's skill in design.

ONE paragraph which appeared in the draft report of the committee on the Houses of Parliament is omitted from the report as approved. It related to the Central Hall, and ran as follows:—"The darkness of this hall is largely due to the character of the indifferent stained glass with which the four large windows are filled. It is, however, no part of the committee's duty to recommend changes in decoration already completed in accordance with the intentions of the Fine Arts Commission. But they would like to call attention to the fact that sixty years ago the revived art of glass staining was in its infancy, and the productions of that date are inferior in every respect to those more lately executed. The best windows in the Palace are, in the opinion of the committee, those in the Royal Gallery, which, while of good design, do not obstruct the free admission of light, which is, after all, the primary object of a window." Many people will suppose the darkness was owing to the architect's incompetence. It should be remembered that stained glass was not controlled by him, but by the Fine Arts Commission. BARRY, in his report, recommended that in the stained glass a ground of a warm, yellowish tint should predominate, "in order that so much light only may be excluded as may be thought desirable to do away with either a garish or cold effect upon the painting and decoration generally." If his advice had been acted on the Central Hall would now present a different appearance.

THE curriculum of the day school and evening school of the Architectural Association has been issued. The organisation may now be considered complete, and the array of masters, lecturers and instructors suggests the capacity to deal with a large number of students. Several members of the Board of Architectural Education are also engaged in other institutions, but give the benefit of their experience to the Association. With the exception of law, which is to a great extent comprised in the classes on architectural practice, every subject which an architect is likely to require in the course of his business is comprised in the courses. The annual general meeting will be held on October 4, when Mr. WALTER CAVE will deliver an address and distribute the prizes. At the ordinary meetings papers will be read on:—"Sentiment in Architecture," by Mr. HALSEY RICARDO; "Travelling Studies," by Professor W. R. LETHBRIDGE; "The Relations between the Architect and the Builder," by Mr. JAMES S. GIBSON; "Laying out London," by Mr. PAUL WATERHOUSE; "Wren's City Churches," by Mr. ARTHUR KEEN; "The Kingston Earthquake and Building in Jamaica," by Sir CHAS. A. NICHOLSON, Bart.; "Stained Glass," by Mr. J. DUDLEY FORSYTH; "Garages and Motor Houses," by Mr. C. HARRISON TOWNSEND; "Oxford," by Mr. EDWARD WARREN; "Water-Colour Drawing for Architects," by Mr. P. L. FORBES; "Some Notes on Domestic Work of the Renaissance in England," by Mr. HENRY TANNER, junr.; "Originality and Tradition in Design," by Mr. LEWIS F. DAY. At the final meeting will be a "Comparison of the London County Hall Designs."

## THE REPORT ON ST. PAUL'S.

IF we may judge from the articles in the newspapers, the report by the committee of architects on the condition of St. Paul's Cathedral has been received by the public with satisfaction mingled with surprise. The cathedral is not only a great example of architecture of which any nation could be proud. It also presents many of the characteristics which are seen in national undertakings, whether of peace or war. In the same way as the English people have muddled through disasters to victory, the design of St. Paul's also exhibits what can be done by a series of errors. It was no brilliant inspiration. WREN had to make several attempts before he could arrive at the present structure, which, with all its alleged defects, is an improvement, especially as regards general effect, on all its predecessors. It is also not unlikely that WREN made other designs of which the drawings have not come down to us. It would therefore be strange if the English people were indifferent to any danger which might arise to so national a building.

Unfortunately the nervousness so generally prevailing in modern England found its way among the authorities of the cathedral. Towards the end of last year it was announced that danger was imminent, and it was no doubt in the expectation of confirming that statement the committee of architects was appointed. Naturally the belief in the danger caused some consternation, for it was taken to mean there was a sudden revelation of a peril which could not be remedied too promptly. As a first step an appeal was made to the London County Council to divert the course of the proposed sewer under St. Paul's Churchyard. In the early part of the year it was officially stated that the Dean and Chapter were satisfied with the contemplated arrangements of the Council's engineers, and that no further objection would be raised. The late Sir BENJAMIN BAKER, who knew as much about the subsoil of London as any man of his generation, reported that there would be no danger to the cathedral in constructing the sewer. The architects who were called in said it was with great diffidence they came to a different conclusion, for owing to the "present sensitive condition" of the structure a sewer might very possibly become a very serious risk to the cathedral. The County Council thereupon resolved that the sewer should be constructed at a greater distance from the cathedral.

After such manœuvres it is no wonder there was surprise when it was announced that after mature deliberation and a thorough examination of the cathedral and its foundations *there is no immediate necessity, according to the committee, for any extensive remedial measures to be undertaken.* In other words, the "imminent danger" was a mere neurasthenic creation. It is true that the conclusion of the committee is based on the assumption that the present conditions of the subsoil and the existing water level will be maintained. But without some such clause the committee would be stultified in their manner of action respecting the proposed sewer. Having once committed themselves to an assertion of the danger of the sewer they cannot now draw back, although by doing so they would save the ratepayers of London from the additional expense arising from the adoption of another line of direction.

WREN has been often described as an engineer rather than an architect. "If the position of Sir CHRISTOPHER WREN as an architect were to be estimated solely from what he has done at St. Paul's," says FERGUSON, "the result would probably be that his character would stand higher as a constructive than as an artistic architect." In proof of this the areas of the points of support which he adopted for the cathedral have been compared with those employed at St. Peter's, and WREN is supposed to have been much more economical. A modern engineer would approve of his arrangements. But the latter would have taken care to construct a stable platform by which any settlement would be generally distributed. The architects' committee in their first report state

"that the three portions of the building that have time to time shown the most significant points of weakness are the south-west tower and the south-west and south-east piers of the support to the dome. The circumstance is not creditable to WREN's foresight, skill, and various dodges had to be employed by him to keep up an appearance of horizontality. Whether the settlement continued to be regular or irregular cannot be determined. The committee say:—

"We have no information as to whether the settlements in the fabric continued uninterruptedly, but we have gathered from various documents, and the reports made by former cathedral surveyors, that the settlements of the fabric which occurred during the building of the church, and particularly in the supporting the dome, have continued in some degree to the present day. After the weight of the main dome had compressed the subsoil to its limit, we think it can be assumed that there was a period of quiescence during and subsequent to the erection of the dome, when movements began to show themselves as a result of additional weight."

It must be allowed that for a building which is 300 years old the cathedral can be considered as successful. The dome of St. Peter's at Rome is not so happy. It was constructed of better material. But it was necessary to hoop it with iron, although the piers supporting it, which are 60 feet square, might be thought to resist expansion or thrusts of all kinds. WREN was no geologist, and he erred through an excessive confidence. He concluded that material which was used to support the great Gothic building during centuries would suffice for another more scientific arrangement.

The condition of the site is a question of great interest for all owners and designers of buildings on a similar foundation. It cannot be said that the conclusions of the committee will satisfy students of logic, or of the less architects, engineers and contractors. The conclusions of the report rely on the fact that in 1831 and 1890, at the instance of the cathedral guardians and the City, the workings were diverted. This merely shows that the imagination was also at work and that the architects were willing to avoid the remotest possibility of a settlement of the building. If there was any settlement of the foundations the stone must have exhibited some crushing. WREN, as we have said, was very anxious to avoid over-massiveness and ran some risk in the supporting the dome. But there is nothing to show that the alarm of 1831, 1890 and 1906 was based on a justification of an excess of pressure on the stone. The general impression to be produced by the report is to palliate the recent display of panic among the authorities, but there are facts enough which show how unsubstantial are the circumstances upon which the committee have to own:—"The principal cause of the appearance to be of long standing, and we have no doubt of their origin, but at present they do not give rise to any special anxiety. We have seen no evidence of 'crushing' as a result of the various settlements."

After such an admission the samples derived from the borings in the crypt deposited in the Museum can only be considered as offering a weak testimony in favour of the stone employed, and of his skilful proportioning of the mass. At the present time the church is safe. Whether it will continue so is a question on which doubts are raised. WREN's masterpiece has become like one of the wonderful sufferers who is to testify to the efficacy of patent medicines and other aids to victory over illness. To many of the public it is as much an advertisement as any of the hoardings from which RICHARDSON EVANS would save town and country. In a business sense the pumping experiments of our time. But it is strange that while the engineers and architects are afraid of the removal of the dome, the proposal accepted by the cathedral authorities for the raising of the tower was intended to be a demonstration of

keeping water far away from the site. Many other es have been devised. The architects' committee—"We have carefully considered the various safe- and remedies brought forward at our meetings ublished by the Press and others interested in the ig, but we do not advise works of underpinning screening the foundations of the church. We er that such operations would only be attended sh dangers." In other words, the old saying, e well alone," should be accepted for guidance Dean and Chapter.

e committee, however, recommend that any struc- work required in repairing the fabric should be aken without delay. They further add:—"The ion of the external stonework also calls for atten- nd we have had the advantage of the opinion of sor CHURCH, who advises the removal of the tations of soot and gypsum by a wood tool, and perimental spraying of portions of the surface with ." We entertain the greatest respect for every- onnected with the cathedral, for St. Paul's is so to the local habitation of *The Architect*, it has claims upon us. But when we think of the nent danger" of November last, and find that it e overcome by the scraping with a stick and ng with baryta water, the venerable saying, rriunt montes, nascetur ridiculus mus," still appears e some point. The report is mainly an effort ise the weakness of vision by which St. Paul's ed to be doomed to suffer a catastrophe owing to sy-going methods of a long line of custodians. blic can, however, discern in the elaborate pages y facts which are explanatory of the true state of hedral, and which are enough to allay all fears urbanity. But the public are also likely to conclude ame time that the cry of "Wolf, wolf!" is no effectual as a call for financial assistance.

### IRISH COUNTY SURVEYORS.

IPETITIVE examinations have during several ears been made compulsory before obtaining a any appointments. And yet men are not ous about whether the testing has produced the fficient officials. There are certain qualities may be more desirable than any ability to questions, and which are not to be ascertained a few hours occupation with technical papers. other hand, the system of education which necessary in order to be successful at an tion may foster men who are not qualified ctual duties which will be imposed upon them. istence may also have an effect on other men nnot be considered satisfactory. An instance ted to us by the papers set before candidates fice of county surveyor in Ireland at the tion which was held in July.

years ago—for it is well to go back to a remote e Irish county surveyor held an almost unique e In essential conditions it differed from that an English county surveyor. In Ireland there manufactures, and the wealth of the country efly produced from the land. As a result was general. The main business of the Irish was to have charge of the roads. But the y of the county, who were his masters, objected diture, and with good reason, for money was d the surveyor had therefore to make a show y on the most economical terms. It was no f archæologists believed that ogham stones, ravestones and masonry from ruined churches l for road material, if not by the surveyor's with an indifference on his part which answered The few traders who objected to delays caused ect roads it was the surveyor's duty to satisfy, ct, diplomacy was more essential for such an an any ability to apply the calculus to engineer- ulties.

If a railway company undertook a new line in his district he could then become very rigorous about the dimensions of bridges. However, contractors used occasionally to modify his strictness by engaging him as their consulting engineer or arbitrator. If a stone or timber bridge had to be constructed over a culvert or a stream the designing was part of the surveyor's duties. If he were ambitious he would have little difficulty in obtaining a commission for a court-house or a prison, but those structures were rarely erected. Workhouses were carried out by a Government department. It was seldom a surveyor designed a church. But on special occasions he was willing to give his services in designing a country house. In the majority of counties his duties were limited. But if there was a large town within a county, then his field of operations was enlarged. For a man who was unmoved by ambition the surveyor's life was enjoyable, and in a land where everybody seeks enjoyment on as many occasions as arise no grand juror would object should he encounter the official at a meet or a shooting-party.

It must be owned, however, that the duties of the office were fulfilled satisfactorily. If the roadmen appeared unable to work it was recognised that energy was not to be procured for the pittance they received. In fact, all the shortcomings of Irish roads to which strangers objected were preferred to the increased taxation which would be necessary if a higher standard were adopted.

It was not difficult to find an abundance of men possessing the desirable qualifications for such an appointment. There was consequently a great variety between the surveyors, although, owing to the circumstances of the country, there could be little difference in the manner of carrying out operations. The office was coveted and the number of applicants increased. It was then decided to hold examinations. That scared away many candidates. But as the questions proposed were closely connected with practice it was soon found they were not too difficult. Finally the examinations were entrusted to the Civil Service Commission, and under their régime young fellows who studied in English, Scottish and German colleges possessed more chances of success than Irishmen, who might not only be acquainted with every yard of the main roads of a county but with the failings of road contractors, the devices of labourers and the defects of all the materials offered for sale.

The papers placed before the candidates in July were undoubtedly suited to test a theoretical knowledge of engineering, and in some instances more or less practical knowledge was required. But what is remarkable is the remoteness of their connection with the peculiar conditions of Ireland. County councils have superseded grand juries as controllers, and plebeians take the place of would-be aristocrats. Yet the finances are in a worse condition than they were fifty years ago, and if the newspaper reports are true, the county surveyor at the present time is less favoured than his predecessors. He may be strong in acoustics, but how will the science serve if the Council should decide he is to give all his instructions in the Irish language? The questions proposed are not adapted to the rough-and-tumble life which is before such a surveyor, and might have been originally prepared for an examination in engineering in Cambridge. For instance, in the first mathematical paper the candidate was required to—

Draw a diagram on a reduced scale showing the variations in position and size of the image of a small object formed by a thin lens of focal length 4 inches; and (a) convex; (b) concave. [Show three or four positions of the object and image on each side of the lens; and mark whether the image is real or virtual.]

Is a county surveyor ever likely to have an occasion to use the knowledge necessary to answer the question correctly? It may be supposed that such a

question is only in the mathematical class, and that more recognition of practice is exhibited when the candidate is asked:—"State what characters you would expect an ideal building stone to possess, and discuss in a general way the relative merits of granite, limestone and sandstone for building purposes." As the surveyor will have to use stone for paving rather than ordinary building stone a corresponding question would be desirable. But it may have been thought the subject of paving stones would have been specially got up. Perhaps it was the same reason inspired the question:—"What are the geological ages of the following formations—London clay, Portland stone, Tremadoc beds, millstone grit, Lenham beds, Keuper sandstone, Wenlock shale, Cambridge greensand?"—which are unknown in Ireland. As we said, roadmaking will require most attention from the Irish county surveyor. Only four questions were asked concerning so important a subject, and it may be said that among the four there was not one which relates to the principles of road construction:—

Describe a machine for rolling roads—state the advantages or otherwise of the single cylinder—give particulars of the weight and its distribution per inch in width on front and back rollers. What quantity of granite macadam is a 10-ton machine capable of consolidating per working day of ten hours? At what cost per square yard can granite macadam be consolidated on a first-class county road? What local circumstances affect the cost?

Describe a method or methods of keeping the surface of a macadamised road free from dust and preventing the surface becoming disintegrated by motor and other traffic. Give particulars of the cost.

Describe the machines employed for scarifying. Give particulars of their use and the cost of working, compare machinework with that performed by manual labour.

The cost of maintaining a road paved with grit setts having largely increased since the introduction of light motors which split the stones, what remedy would you suggest? Give your reasons and full particulars of any work recommended and its cost.

The most curious series of questions were those relating to architecture, which is supposed to be part and parcel of the county surveyor's duties. They are as follows:—

Name the Classic orders of architecture and sketch the base, column, capital and entablature of a typical Roman example. The sketch is to be about 15 inches high from the bottom of the base to the top of the entablature. State briefly the differences in the capitals of any well-known Greek and Roman examples of the Ionic order. Or,

Sketch (a) a Norman cushion capital, (b) a thirteenth-century crocket, (c) a twelfth-century piscina, (d) a twelfth-century buttress, (e) a capital of the Perpendicular period.

Draw the plan, elevation and section to the scale of 1 foot to the inch of a bay window with doors leading from a drawing-room to garden. The bay is to be about 9 feet wide by 3 feet deep, is to have side lights, and to be executed in stone with hardwood joinery.

Draw to the scale of 8 feet to the inch the plan, elevation and section of a cottage for a farm labourer. The accommodation is to consist of a living-room and small scullery, two bedrooms, earth closet, &c., all planned on the ground floor. The materials to be employed are bricks for the walling and slate roofs.

Write a brief specification of the work to be executed by the following trades in the erection of the cottage:—Bricklayer, slater, and carpenter and joiner.

Describe and sketch the following details in building works:—(a) Dragon tie, (b) sprocket piece, (c) tilting fillet, (d) stepped flashings, (e) closer in brickwork, (f) joggle in stonework, and (g) solder dot.

Draw to the scale of half an inch to the foot one-half of a Mansard roof for a 30-feet span, with timber dormer. The rain water is to discharge into an eaves gutter.

It will be evident from the questions we have given—and we could have printed several others no less remarkable—that the framers of them could have had no clear and definite idea of the duties of a county surveyor in Ireland. But as the questions must exercise an influence on the preparatory studies, aspirants for

the appointment can hardly fail to think they possess scientific knowledge of all kinds, and are capable of undertaking works in "railway and canal engineering, marine engineering, including harbour, dock, sea reclamation works; hydraulic engineering, including water supply, sewage and irrigation; county works including architecture, roads, drainage and river works. In everyday life and its struggle for existence it is allowable for men to profess that, like BACON, they have taken all knowledge for their province, and are not to any specialists in engineering and architecture. When an official stamp is put upon such pretensions the case is different. If a county surveyor confine his attention to road-making he could render valuable services to the State—much more, in fact, than he is to do if he seeks to monopolise all kinds of construction. There is already too much of that spirit in Ireland, and it is not wise to extend it. Ordinary county surveyors should be allowed fair play; for while they dare not interfere with the county surveyor's duties they can readily deprive them of the means of doing so, although by so doing he increases the expense which the public must meet. When the next examination for county surveyors is held we hope there will be more recognition of actualities than was displayed in July, and that foreign subjects, however interesting, will be introduced with caution.

## ARCHITECTURE IN AUSTRALIA.\*

GENTLEMEN,—On the completion of my second year of office as President of this Institute, I have to thank you for the honour you conferred on me, and I trust my efforts to worthily fill the chair have met with your approval.

I feel satisfied that, although the immediate results are hardly as distinct as I should like, the Council and I at all times kept in mind the interests of the profession, and I trust that as the colony of Victoria progresses the architectural profession will be raised in status, and the education of a practising member will be of necessity defined, and a high standard of ethics obtain in dealing with the various measures which come under his jurisdiction.

I have always considered that our profession requires special qualifications and training, which the mere artistic feeling only does not cover, and this more particularly applies here, where an architect can specialise in one branch. The modern architect must be strictly of business habits, and have the strongly constructive experience which is often lacking in the artistic, while his position should be one of absolute honesty of purpose by his employer, who must be able to judge from the appearance and detail of his work, be it in the conservation of his interests. The successful architect should also, I consider, have the confidence of the men who tender to carry out work from his plans, although in the earlier stages of his career one of the owners may gain advantages by sharp practice on the part of an architect, in getting more out of the details than the original contract evidenced, the rest of the client must suffer, as builders are extremely human.

This leads up to the question of registration of architects which is at present being debated by two schools in England—for and against possibly on the art or professional basis—but this registration already exists in operation here, which bears far less on the health of the community than the proper arrangement of their buildings. Of no amount of examinations or passing of regulations can make an architect, but it should prevent the speculator and land agent from taking in the unwary home purchaser, who is, if satisfied with the appearance and a statement of the house generally, disillusioned in a year with the construction. We know that, if properly planned, villas bear a relative cost with each other, but when we find the house with the land thrown in for the cost of the house alone, one sees that something is wrong. In any case, with most of the work done now the general character and finish of this class of residence warrant the expense of the small addition in architect's fees.

\* Retiring address delivered by C. A. D'Ebro, A.M., president of the Royal Victorian Institute of Architects, February 26, 1907.

This registration will, I trust, be warmly taken up by the members, and the Council have in their report referred to it. It will not affect the present architects so much, but will certainly improve the status of those who follow.

As regards the knowledge required by an architect in modern times there has been a great change, for although he cannot expect to be thoroughly expert in the whole of the subsidiary items of construction, he should have sufficient experience to be able to arrange for the best advice on the many points which will occur in extensive schemes—electric light, heating, girders, concrete reinforced in various ways, &c. This latter must of necessity make great headway and its possibilities are unlimited. Of course, this material will not lend itself to every case, to the disadvantage of the older materials, but for special work, where the materials forming the matrix are handy, possibly it will be cheaper than brick or stone. I have no doubt that you have all received pamphlets and descriptions of various systems, and bars twisted and indented, cut and plain, the agents for which all assure you that theirs is the only one worthy of consideration; in fact, the variety of patents is legion. I am convinced that it will be found that certain firms will specialise in the erection of this class of work, but I do not think that architects need fear that Edison's scheme of pouring out a house, as per catalogue, has arrived. The architect will still be wanted, but if the outside walls are to be of concrete, then there will be no necessity to disguise the fact, and cut lines to indicate joints in masonry. They will be stucco, certainly, but honestly so, I trust.

It is to be hoped that when the City Council of Melbourne revise the obsolete Building Act some measure of attention may be given to this question.

In the development of natural material for construction there has been but little progress. We, as an Institute, have heard papers on the magnificent possibilities of the country, but there has been no discovery of a cheap building stone of good colour. I am pleased to see that there is more general use of marbles, but these have to be brought long distances and arranged for months before wanted. There are some of the finest varieties possible, but I am doubtful of their permanence in outside work unless carefully looked after and repolished. It is, however, to be hoped that, as clients have now to be satisfied with lower returns on expenditure, a more permanent and better class of building will be put up.

The unfortunate dispute in the building trade which has recently occurred has had, I am afraid, a bad effect on the capitalistic class, who naturally consider that the cost of construction will be raised in anticipation of further claims on the part of the men, and I am afraid that in many cases schemes which were about to be carried out will be delayed indefinitely, and the cause of labour will suffer equally with our own, as investors will put their money into more liquid securities than buildings.

It is to be hoped that the members of the Institute will assist in every way possible in the education of the various tradesmen on whose work they have to rely for the execution of their designs, and as the present schemes of technical education do not cover sufficiently the practical side of the question, it is still necessary, in my opinion, that a defined apprenticeship should be entered into by those learning the higher branches of labour. It must be patent to all of us that it is difficult to get the same class of work at the present time as existed twenty years ago. This is partly due to the fact that the better class of tradesmen have either died out or have left the colony for other parts. I feel that there is also a great want of personal interest in their work on the part of many of the younger workmen, and this can only be instilled into them by a higher moral tone, which I regret to say is largely wanting. It appears that there is a feeling of antagonism on the part of many men against anyone who employs them. There is certainly not sufficient interest in their work to warrant their being good employers themselves, if even they have the ambition to occupy the position.

The architectural profession itself has had a very trying experience in Australia for many years, as there is no occupation which feels the commercial depression sooner, and the tender columns of the papers form a very good indication of the progress of a country. I, however, hope that with the introduction of population and a continuance of good seasons, the present prosperity will continue and that opportunities will be given for the exercise of the good taste and constructional experience which there is no doubt exists among members of this and other Australian

Institutes. Our own Institute has, I hope, taken a fresh lease of life with the new lease of better rooms, and the amalgamation with kindred societies in their occupation will give opportunities for exchange of ideas and an acquisition of knowledge which will be of great use to us, and I venture to think of equal value to our co-operators. It is a great matter for regret to me that our meetings have not been attended as many of them deserved, and unless the younger members assert themselves by coming forward and taking part by reading papers, or discussing those of older members, the Institute will not have the weight it should have.

I shall not weary you longer by my remarks, but will conclude with the hope that my services as President have met with your approval, and to congratulate you on the appointment of a gentleman who will, I feel sure, raise the status of the position, and who is by character and attainment worthy of your confidence.

### SCOTTISH CASTLES.

UNDER the supervision of H.M. Board of Works a number of necessary improvements have been made at Edinburgh Castle. The Esplanade, formerly very unpleasant to walk on because of loose, sharp stones, has been partly laid with tar macadam. The drawbridge has been strengthened and the causeway relaid, and a lot of repointing done to the stonework of the buildings. A tank capable of holding 50,000 gallons of water, in order to add to the precautions against fire, has been erected, and round it has been built a circular wall of grey stone so that the tank, which can be seen from Princes Street, does not detract from the amenity of the buildings. Other provision has also been made for dealing with an outbreak of fire. Big alterations have been made in the drainage of the Castle. The old brick or rubble drains were in a bad state, and they have been replaced by an improved type, while the drains from Crown Square and the southern and eastern portions have been remodelled. The laying of the new drain down the face of the rock was a difficult undertaking. Crown Square, which is the resort of all visitors to the Castle, has been levelled, and improvements have been made in the officers' mess and the military hospital. The old prison block is to be converted into a central bath-house, and the old regimental colours in the banqueting hall are being preserved by silk netting.

At Stirling Castle a huge cast-iron red-painted tank, plainly visible from the King's Park, has been removed, as well as certain unsightly chimneys. All visitors to Stirling Castle know the Douglas Garden and the Douglas Room, where James II. murdered the Earl of Douglas. The original part of the castle there was destroyed by fire in 1855, but was restored in 1856 in keeping with the old design. The building is therefore in a thoroughly well-preserved state, but not so the old outlook wall which bounds the garden. To that wall all visitors go to scan the Highland mountain peaks in the far distance beyond the pleasant fertile straths. The ravages of time had made the wall at that view-point show signs of decay. It was falling away badly and was bulging considerably. About 175 superficial yards had to be repaired to make the wall thoroughly substantial again.

The sculptured figures on the exterior of the old palace, with its fantastic architecture, had also in many instances become terribly defaced, and if the statues and grotesque figures were not to be lost completely, something had to be done speedily for their protection. Apparently generations had gone by since anything was done to preserve them. In some cases the fastenings had decayed, and others were blown loose. All the figures have now been properly secured with holdfasts to prevent their destruction, but, of course, there has been no tinkering with the figures themselves. The south-west corner of the officers' quarters in the Douglas block, where there was an overhanging bay, had become in an exceedingly dangerous state, and bulged as much as 6 inches. That portion had to be taken down and underpinned. Owing to frequent alterations the building had become "dislocated." In its original form there was no finer bit of architecture in the castle buildings than the ancient Parliament House. Changes to provide barrack accommodation have, however, ruined the beautiful Tudor window and other distinctive features, and these are now beyond recall. All that can be done now is to point the walls to keep them in repair. That operation has now been carried out.

A great improvement has been made in the Argyll Lodging, Stirling, situated to the south-east of the Esplanade, which has been used as a military hospital since 1799. This fine spacious quadrangular building was much in need of an overhaul. By some strange freak the four windows on the ground floor had been bricked up till only a small aperture was left at the top. This unsightly treatment spoiled the whole front of the building. The windows have now been opened up as they were originally, and the effect greatly enhances the general appearance of the old edifice. The common form of rain-gutters, which also detracted from the look of the building, have been removed, and others more characteristic have been put in their stead. With its beautifully kept grounds, the Argyll Lodging now presents all the charm of an old-time mansion.

#### HOLYROOD CHAPEL.

THE Council of the Edinburgh Architectural Association in February accepted the resolution adopted at a meeting of the members. It was to the following effect:—"That looking to the public interest that has been aroused on the question of the repair and restoration of the Chapel Royal, Holyrood, through the intimation of a legacy of 40,000*l.* for these purposes by the late Earl of Leven and Melville, it be remitted to the Council to report upon the following points, viz.:—(1) What remains of the structure exist; (2) The condition and capabilities of the parts remaining; (3) Whether the evidence of these parts is sufficient to enable a satisfactory repair and restoration of the structure to be made." The Council appointed the following special committee to examine and report:—G. S. Aitken, T. Arnold, F.R.I.B.A., J. T. Baillie, Hippolyte J. Blanc, R.S.A., F.R.I.B.A., F. W. Deas, Henry F. Kerr, A.R.I.B.A., David Robertson, A.R.S.A., F.R.I.B.A., H. O. Tarbolton, F.R.I.B.A., John Watson, F.R.I.B.A.

The following report is the result:—

Nine meetings of the committee were held, three of which (each of several hours duration) were at the chapel. Many independent visits also were made by the members of committee. Further, your committee have had, as instructed, the advantage of consultation with the following eminent architects in Scotland, and other persons of skill who are not members of the Council:—J. J. Burnet, A.R.S.A., F.R.I.B.A., Glasgow; Wm. Leiper, R.S.A., F.R.I.B.A., Glasgow; A. M. Mackenzie, LL.D., A.R.S.A., F.R.I.B.A., Aberdeen; E. C. Morgan, Glasgow; Alexr. Ross, LL.D., F.R.I.B.A., Inverness.

1. The remains of the structure existing comprise:—The north aisle wall.

The west wall, except the top of the gable.

The north-west tower, to the top of the bell chamber; parts of two piers on the north side of the main arcade, and vestiges of the triforium and clerestory. The south side of the main arcade, the triforium over the fragments of the clerestory arcade and high vaulting.

The south aisle wall, so far as not interfered with by the palace buildings; the vaulting of the south aisle; fragments of the cloister; the piers and three arches which opened into the transepts and crossing, filled with later walls and window tracery. These now form the east end of the chapel. Fragments of the west walls of the two transepts.

2. Of the condition and capabilities of the parts remaining your committee find that:—The walls and piers (so far as your committee were permitted to examine them) are well built with rubble core, and ashlar or cube stone facing. The stone appears to have been carefully selected, and is, with the exception of some surface wasting, in good condition. Where it was possible to examine the mortar in the walls, it appeared to be sound. The walls are not all vertical, but with the exception of the south wall of the main arcade, they are so slightly off the perpendicular that their stability is not affected.

The south wall, embracing the main arcade and triforium, 42 feet in height, bulges inward on plan from each end and overhangs in vertical section about 14 inches into the nave (near the centre of its length). The thickness of this wall averages 4 feet 3 inches. Your committee believe that this wall is able to support the clerestory, the stone vault and the timber roof needed to complete the building. If, on a more thorough inspection than your committee were permitted to make, any parts of the structure were found to be seriously faulty, those parts might be reconstructed without affecting the fabric.

3. Upon the third point of the remit your committee have no hesitation in saying that from the evidence of the parts remaining there is sufficient to enable a satisfactory structural repair and restoration to be made, but they express no opinion on the historic or æsthetic aspect of the question, as such does not fall under the remit.

Your committee desire to place on record their appreciation of the courtesy and kindness of Mr. W. T. Oldrieve, H.M. Chief Architect for Scotland, under whose directions, Mr. Robertson, his chief clerk of works, and the members of his staff, gave your committee every facility and assistance in their power.—In the name of the committee,

HIPPOLYTE J. BLANC, R.S.A., F.R.I.B.A.,

Convener.

At a meeting of Council, held on August 9, the foregoing report was submitted and unanimously adopted.

#### A HOUSE OF OWEN GLYNDWR.

THE district selected for the annual excursion of the Shropshire Archæological Society was, according to the *Shrewsbury Chronicle*, the extreme edge of Shropshire bordering upon Denbighshire, where the fertile valleys were for centuries debatable ground between tribes and nations. Sycharth, an entrenched mound, marks the site of one of the chief houses of Owen Glyndwr. Here the Rev. Prebendary Auden read the following paper:—

Mr. A. G. Bradley, in his work on Owen Glyndwr, in the "Heroes of the Nations" series, claims for him that he stands at the head of Welsh patriots, and in reputation towers above all the rest. It is to be feared, however, that the details of his career are known to comparatively few outside the Principality and its borderland, though many more are familiar with his name as one of the characters of Shakespeare. In the play of "Henry IV." (part 1) the dramatist introduces him as surrounded by an atmosphere of mystery and magic, as one at whose birth

The front of Heaven was full of fiery shapes;  
The goats ran from the mountains, and the herds  
Were strangely clamorous to the frightened fields—

and as altogether one not in the roll of common men.

We need not, however, go to what is legendary to arrive at Owen Glyndwr's greatness—a man who for more than ten years remained unconquered in face of the power of the whole English kingdom deserves our highest respect. Born in or about the year 1359, it is remarkable that for the first forty years of his life he was a peaceful, law-abiding subject of the king. And he was no wild bandit chief. In Shakespeare's play, already quoted, when Hotspur taunts him, he replies:—

I can speak English, lord, as well as you,  
For I was trained up in the English Court.

And this is confirmed by history. As a youth he was a squire to Henry of Bolingbroke, afterwards Henry IV., and his bitterest enemy: possibly before that to King Richard II. In his early manhood he married the daughter of Sir David Hanmer of Hanmer, and was the father of a numerous family. He had two homes in North Wales—the one at Glyndyfrdwy, near Llangollen, the other at Sycharth, where we stand. He had also some possessions in South Wales. At one or other of these northern homes he was leading the life of an ordinary country gentleman when a quarrel with one of his neighbours wrought a complete change in his life. This neighbour was Lord Grey of Ruthin, one of the Marcher barons, who seized on a strip of land which had formed part of Owen's estate. The matter was tried in the law courts and Owen's claim was sustained, but when—towards the close of 1399—the crown passed from Richard II. to Henry IV., Lord Grey took the opportunity of again seizing the coveted territory. Owen's second appeal was contemptuously refused and he resorted to arms. This quarrel between the two neighbours soon took a wider sweep and assumed larger dimensions. It was an easy matter for his enemies at Henry's Court to denounce Owen as opposed to the new king, and he was treated as a rebel. Time will not allow us to pursue the story. It is largely summed up in the words Shakespeare puts into his mouth:—

Three times hath Henry Bolingbroke made head  
Against my power; thrice from the banks of Wye  
And sandy-bottomed Severn have I sent  
Him bootless home and weatherbeaten back,

And everyone here will remember his association with the Battle of Shrewsbury. True, we must give up the tradition of his climbing the Shelton Oak to watch its progress, but he was in alliance with the Percies in their rebellion, and had he come up from South Wales in time the battle might have had a different result. He held out against the king to the last, and at length, according to tradition, died in the house of his youngest daughter, about the year 1416 or later, and rests in the churchyard of Monnington, in the neighbouring county of Hereford, which was his daughter's married home.

I turn now to Sycharth itself. It is, I think, impossible to study the site without arriving at the conclusion that it was occupied by a dwelling long before the time of Glyndwr. The central mound with its surrounding ditches goes back to Saxon or at least to Norman times, when it would be occupied by a house constructed of wood and protected by a stockade. We know nothing as to the period at which this gave way to a more substantial edifice, but it happens that we possess two records contemporary with Glyndwr, one of which describes the house which he himself inhabited, and the other what were the circumstances under which it was destroyed. Owen had among his friends a poet by name Gruffydd Llwyd, but better known by his bardic appellation of Iolo Goch. This friend apparently often stayed at Sycharth, and he has left an account of the house and its management. He speaks of its large extent, embracing nine halls or rooms, each furnished with a wardrobe to hold clothes for his retainers; and in illustration of this latter fact it may be mentioned in passing that there is a tradition that on one occasion Glyndwr caused Lord Grey to retreat from a contemplated raid by driving a number of stakes into the ground and covering them each with a cap and jacket, which were mistaken for men. Iolo goes on to say that near the house itself, on a verdant bank, was a wooden building supported on posts and roofed with tiles, where, in eight rooms, were sleeping apartments for guests; and that there was also a cruciform church containing several chapels. Among the surroundings were the usual accompaniments of a gentleman's residence—entrance gateway, pigeon-house, mill, fishpond, heronry, and so on—and a park well stocked with game. The owner was held in such respect that bolts and bars were unknown, and so profuse was the hospitality that no porter was needed at the gate. Nor does the poet forget the mistress of the establishment. He has not only praise for her white bread and her metheglyn, but for herself as the best of wives and the mother of a beautiful nest of chieftains.

It is sad to think that this mansion, which called forth so much poetic enthusiasm, was destined so soon to more or less complete destruction. Among the "Original Letters Illustrative of English History" preserved in the British Museum and printed by Sir Henry Ellis is one in Norman French from Henry, Prince of Wales, afterwards Henry V., addressed to the king and his Council. It bears date May 15, but without mentioning the year. It is uncertain whether it belongs to 1401, 1402 or 1403, but any way it was written not long before the Battle of Shrewsbury. The prince was not much more than a boy, but his father had sent him to the Welsh border to ascertain the state of affairs before he came himself. The letter, it will be noticed, shows the prince in a very different light from the Madcap Harry of Shakespeare.

The translation of the part bearing on our present subject is as follows:—"Very dear and entirely well beloved, we greet you much from our whole heart, thanking you very dearly for the attention you have paid to everything needful that concerned us during our absence; and we pray of you very earnestly the continuance of your good and kind disposition, as our trust is in you. By way of news that have here occurred, if you wish to hear of them, we have among other matters been lately informed that Oweyn de Glyndourdy has assembled his forces and those of other rebels adhering to him, in great number, purposing to commit inroads, and in case of any resistance being made to him by the English, to come to battle with them, for so he vaunted to his people; wherefore we took our forces and marched to a place of the said Oweyn, well built, which was his principal mansion, called Saghern, where we thought we should have found him, if he had an inclination to fight in the manner he had said; but on our arrival there we found nobody, and therefore caused the whole place to be burnt, and several other houses near it belonging to his tenants. . . ."

The letter then goes on to state that the prince afterwards marched straight to Owen's other place at Glyn-

dourdy, and burnt a fine lodge in his park and put to death a friend of his whom they captured. Then, having related how they further laid waste the country of Merioneth and Powys, the letter concludes:—"May Our Lord have you always in His holy keeping. Given under our seal at Shrewsbury the 15th day of May."

What was the real extent of this destruction wrought by the prince at Sycharth we have no means of knowing—he evidently regarded it as complete. The place was probably never restored, at least to any large extent, for during the rest of his career Glyndwr had no opportunity of settled life. He had committed himself to a game of which the stakes were nothing less than royalty, and the play involved constant movement from place to place. He is well described by his contemporary Capgrave as one "whom the king was continually searching for and never was able to find, for, wandering among the mountains and caverns of Wales, he had never any certain dwelling-place, nor indeed could he be captured by anyone."

Sycharth probably remained a ruin as left by Prince Henry's soldiers, and through the five centuries which have since rolled by became like other ruins a quarry for new erections in the neighbourhood. When Pennant visited the spot in the second half of the eighteenth century there were stones still to be seen scattered about, but all these have now disappeared and greensward covering the earthworks alone remains. But its memories like the grass are green. Sycharth must ever remain a sacred spot—to the Welsh first, but after them to all others who reverence whatever is noble and brave and patriotic in the annals of the past.

#### THE LATE WM. LECK.

THE death lately occurred in Durban of Mr. Wm. Leck, architect, member of the firm of Leck & Emly. According to a local journal it has caused the keenest regret among a large circle of friends and acquaintances to whom Mr. Leck had endeared himself by his culture and urbanity. His decease has taken from Johannesburg one of its leading architects, and deprived many men of one whose friendship was very deeply valued both for his kindness of heart and the intelligent and keen interest he always displayed in those who had the honour and pleasure to be on terms of intimacy with him. As an architect and business man Mr. Leck was invariably in the front rank, and his services were at all times in demand, whether for the design of large buildings or in courts of arbitration and law. His great experience of his profession was always recognised by his brother architects, and the highest positions amongst the architectural societies in the Transvaal were filled by him. At the time of his decease he was president of the London Society of Architects (South African branch), and senior vice-president of the Transvaal Institute of Architects, of which body he was in 1903 the president, and had life permitted he would next year have undoubtedly been its president for a second term. Three years ago he was elected a Fellow of the Royal Institute of British Architects. Amongst the buildings with which Mr. Leck was connected as architect were the New Stock Exchange, New Club, Trust Buildings, Public Library, National Bank, Carlton Hotel, besides many of the fine mansions in Parktown and other quarters, amongst others those of Mr. H. C. Hull, Johns, Eckstein, &c. Mr. Leck was regarded as being particularly happy in planning interior decoration, and he showed intelligent appreciation of the stronger works of the Italian and English Renaissance, on which most of his own work was based. In addition to his professional work, Mr. Leck displayed the greatest interest in general affairs, as an examiner in architecture of the University College, in connection with the Caledonian Society and the South African Association for the Advancement of Science. Though he did not enter public life, he exhibited at all times a broad-minded spirit and rendered willing service in connection with many public and charitable movements. His is a loss which cannot fail to make itself severely felt for a long time, as his activities were at the full and extended far in many directions during his seventeen years' residence in Johannesburg.

The Sunderland Educational Committee have agreed to extend its technical college, in order to make engineering laboratories and day-training college accommodation, at an estimated cost of 10,000*l*.

## NOTES AND COMMENTS.

OWING to the operation of the Civil Service age rule, Colonel PLUNKETT has resigned the directorship of the National Museum of Science and Art in Dublin. He is succeeded by a namesake, Count PLUNKETT, who holds a Roman title; he is in his fifty-sixth year, and can therefore fill the office for nine years at least. He is an excellent type of the cultured amateur; he has already delivered a course of lectures on the arts of the Italian Renaissance in the museum, and he was the founder as well as one of the principal upholders of the Arts and Crafts Society of Ireland. In all movements for the promotion of art and literature in Ireland he has been foremost. He has written about SANDRO BOTTICELLI; also PINELLI (for the Dante Society), and original and translated poems, besides contributions to magazines and journals. Under his direction the museum should prosper, and from his experience as a collector it may be assumed he will rival the director of the Irish National Gallery in making the limited allowances of the Government secure objects which will be worthy of attention.

It is not often so much success awaits exploration on a limited area as has been granted to Lord Boston. In May 1905 he began excavations near his house at Dinlligwy, in Anglesey. A Romano-British outpost was revealed. It consists of an outer enclosure covering about half an acre, which surrounds smaller enclosures, comprising roughly two circular and practically oblong chambers. The walls in some cases are in a remarkable state of preservation. They are formed of limestone without mortar. Among the relics contained in the enclosure were black pottery of the Romano-British period, flint implements, Gaulish ware, lumps of iron, seashore shells, Roman coins and metallic slag, the last being abundant. Some of the pottery bore marks of having been repaired with iron clamps, which peculiarity had not hitherto been found in connection with pottery of the Romano-British period. The old village, consisting in part of the two circular chambers, was constructed about the beginning of the Christian era, or earlier; while other portions were probably erected under Roman influence, if not under direct Roman supervision, about the beginning of the second century. Sir HENRY HOWORTH, who visited the ruins, expressed the opinion that the coins discovered pointed to the Roman occupation of the ground in the fourth century. He regarded the buildings as Roman, though the round chambers seemed very much like Irish. Professor SAYCE believed the settlement was no earlier than the Late Roman period, the coins pointing probably to the fourth century. He was also of opinion that the settlers were engaged in working mines, as evidenced by the fact that they used iron for mending pottery.

## ILLUSTRATIONS.

GIFFORD HOUSE, ROEHAMPTON.

THIS house was rebuilt for Mr. J. D. CHARRINGTON during 1900-3, from designs by and under the supervision of Mr. G. H. FELLOWES PRYNNE, F.R.I.B.A. The work was rendered peculiarly difficult by the necessary incorporation of some portion of the old walls and floors of various levels of an existing house. The whole of the south façade, which is 216 feet in length, is, however, entirely new, as are also the various other portions of the house illustrated. The building was carried out under a priced schedule by Mr. JAMES CARMICHAEL, builder, of Wandsworth.

HOUSE AT MOHARREM BEY, ALEXANDRIA.

THE house at Moharrem Bey is the property and residence of Mr. J. DAVIES BRYAN, of Alexandria, and was built by native labour from the drawings and under the supervision of Mr. ROBERT WILLIAMS, F.R.I.B.A., who in order to introduce good English work in Egypt has been practising for some years in

Alexandria. The house, erected in Moharrem Bey, a suburb of the city, is composed of a basement, a ground floor and a first-floor storey, and the happy disposition of the rooms makes it a striking and comfortable residence. Its style, though keeping its Arabic character, has been cleverly combined with some English features which give a rectilinear symmetry to the whole structure. The masonry work is mainly executed in local limestone and is bonded by courses of native brick. The principal features of the house have been carried out in local brick, cut to shape and prepared to receive the decorative mouldings, which have been run in plaster over them. The building stands in its own grounds in which a tennis court has been provided, the whole forming a unique architectural contribution to this rapidly growing and important city of the near East.

COUNTRY HOME, HEREFORD.

THIS picturesque country home is delightfully situated at the top of Adams Hill, between Hereford and Breinton. The windows of the chief reception rooms command extensive views over the Wye Valley and the Black Mountains beyond. The planning is a model of convenience and compactness; the rooms for the family are cleverly cut off from the kitchen quarters and the main entrance door can be reached by the servants without the necessity of traversing the main entrance hall, which has become a valuable additional room. This is a point which is frequently overlooked. The entrance porch is recessed and forms a convenient place for bicycles, &c. The floors of the chief rooms are laid with solid oak blocks, and all the woodwork in the main entrance hall, including the staircase, is the best Crown Austrian oak, dull waxed. A novel feature of the plan is a folding panel partition separating the drawing-room from the morning-room, and enabling the two rooms to be thrown into one large room about 36 feet long and 16 feet wide, for receptions, dancing, &c. A verandah along the garden front of the house enables full advantage to be taken of the fresh mountain air, and can be reached from the drawing room and dining-room, as well as from the entrance hall, thus affording communication between these rooms without passing through the hall. The top of this verandah is formed into a really serviceable balcony, access to which is obtained from a small landing, separating the chief bedroom from the dressing-room adjoining. On the first floor are five bedrooms, dressing-room, day and night nurseries, two servants' bedrooms and two bath-rooms, each of the latter being supplied with a plentiful amount of hot and cold water. The hot water is supplied from an independent boiler in the basement, and also from a boiler at the back of the kitchen range; both these boilers can be worked together, or either separately. The various rooms have fireplaces and mantelpieces designed by the architects; the rooms and passages are also heated by radiators, the heating medium being low pressure steam from a boiler in the basement. The exterior walls are brick, relieved with oak half-timbered work; the roofs are covered with boarding and felt upon which are laid picturesque rustic slates, in random sizes. The architects are Messrs. GROOME & BETTINGTON, of Hereford.

SEMI-DETACHED HOUSES, CHALKWELL HALL ESTATE, WESTCLIFF.

CATHEDRAL SERIES.—SOUTHWARK: NORTH SIDE OF CHANCEL, SHOWING TRIPORIUM.

RESIDENCE, BLACKROCK, BRIGHTON.

THIS was designed and executed some years ago by the owner acting as an amateur builder, without superintendence on the part of the architect. The house was planned to command views out to sea and to accommodate a quite small family. Three floors are obtained in the back extension. The perspective drawing is by Mr. F. L. GRIGGS. The architect is Mr. WALTER MILLARD. The illustration appeared in our issue of August 30.

## THE PALACE OF WESTMINSTER.

WE have already published the most important part of the evidence given last year before the select committee of the House of Lords relating to the unfinished condition of the rooms in the Palace of Westminster appropriated to the service of the House and their approaches. The committee again met this year to consider their report. The following are the recommendations offered as the results of their investigations:—

A.—*The Royal Staircase*.—The intention of the Fine Arts Commission was that this staircase should be adorned by statues. Seventeen pedestals have been erected but they are all vacant, not one having as yet received the statue which was meant to be placed upon it. It will, the committee think, be granted that, the pedestals being there, they should not be allowed to remain permanently useless and empty. But, on the other hand, it cannot be said that the supply of statues for them is an immediate necessity, any means one of the first objects to be considered in connection with the completion of the decorative work of the Palace. At the top of these stairs are two wall spaces which the Fine Arts Commission proposed to fill with paintings. But the light here is extremely bad, and it may be questioned whether any pictorial treatment of these spaces is at all desirable.

B.—*The King's Robing Room*.—The Fine Arts Commission determined that the walls of this apartment should be decorated in fresco with subjects illustrating the legend of King Arthur, and committed the execution of the work to Mr. Dyce, whose frescoes cover the north and west walls of the room. The two spaces on the south wall on either side of the throne are still blank, and should, in the opinion of the committee, be filled with paintings in harmony with the already executed by Mr. Dyce.

C.—*The Queen's Robing Room*.—In this room there are two large panels, now covered with flock paper, which were by the Fine Arts Commission intended for pictures, one of which has been even begun. These two rooms and C are among those which possess the best light in the building, and from a purely artistic point of view may be considered to be those in which any fresh work should be done. But with a view of exciting public interest in the progress of the work it is probable that it would be more prudent to commence any renewed effort to complete the decoration of the Palace in some part of the building more generally frequented.

D.—*The Royal Gallery*.—This fine gallery was intended by the Fine Arts Commission to contain nineteen large pictures representing scenes from English history. Two of these, filling the largest panels in the room, and representing the *Death of Nelson* and the *Meeting of Wellington and Blücher*, have already been painted by Maclise. The designs and sketches of a third, representing Queen Elizabeth at Tilbury Fort, still exist, but owing to misunderstandings arising with respect to the painter's remuneration the picture was never completed. Seventeen panels remain unfilled. It may be questioned whether the apartment would not gain in dignity by such a modification of the original scheme as would provide for a greater amount of plain wall space than was originally contemplated by the Fine Arts Commission. The statues intended for the Royal Gallery have all been executed and are in place.

E.—*The Prince's Chamber*.—For about two-thirds of the length of this room the scheme of decoration laid down by the Fine Arts Commission has been thoroughly carried out. Twenty-eight narrow upright panels are filled with interesting portraits of persons connected with the royal families of Great Britain, and the twelve smaller panels with bronze carving representing events selected for decoration by the Fine Arts Commission. But the upper part of the room is still unfinished. The intention of the Fine Arts Commission was that the six large panels next the ceiling should be filled with tapestry reproducing the hangings destroyed in the fire of 1834, representing the flight of the Spanish Armada. The Fine Arts Commission stated that they deemed the preservation of the design of ancient tapestries to the nation by such a reproduction "of great importance." Whether it would be desirable to carry out this original intention, to substitute for tapestry original copies of the designs, or possibly to break up the spaces which if so filled might seem to overweight the comparatively small scale of the scheme of decoration displayed in the Royal portraits and wood-carvings below, are questions which may be more properly considered by the advisory council (the appointment of which

is recommended in another part of this report) than by this committee, but the committee are of opinion that the decoration of this room, considering its importance and its immediate contiguity to the House of Lords, should not be left in its present half-finished condition.

F.—*The House of Lords*.—This is one of the few apartments in the Palace in which the recommendations of the Fine Arts Commission have been fully carried out and thoroughly executed. This being so, the committee have nothing to recommend under the terms of the reference made to them.

G.—*The House of Lords Lobby* and

H.—*The Peers' Corridor between the House of Lords and the Central Hall* may also be said to have been completed in strict accord with the intentions of the Fine Arts Commission and therefore removed beyond the scope of the committee's inquiry.

I.—*The Chairman of Committees' Committee Room*.—Of the seven compartments in this chamber reserved for paintings two have been filled and five remain empty. The two pictures completed are the great fresco *Moses and the Israelites*, by Herbert, and an oil-painting of the *Judgment of Daniel*, by the same artist. The light in this room, which is wholly from above, is good, and the committee are of opinion that the decoration of this room should be completed.

J.—*The Central Hall*.—It was intended by the architect and by the members of the Fine Arts Commission that this hall should contain sitting statues of four of the greatest English statesmen, and that the four arched compartments above the doors should be filled with mosaics of the patron saints of England, Scotland, Ireland and Wales—St. George, St. Andrew, St. Patrick and St. David. Two of these compartments have been filled in; two remain empty. It will be seen on reference to the evidence taken by the committee that it has been suggested that the arched compartment over the door between the Central Hall and St. Stephen's Hall should be pierced and filled with open tracery. Probably, however, it will be found desirable to adhere closely to the original scheme. The two mosaics already completed represent St. George and St. David. These being already in their places, it might seem somewhat invidious were either St. Andrew or St. Patrick omitted. Two admirable coloured designs for the figures of these two saints were completed by Albert Moore in 1866, and are in the possession of the Government. The committee find it impossible not to regret the abandonment of the original decision that only sitting statues should be placed in this hall. The present standing statues with their pedestals go far to destroy the repose and dignity which the hall would otherwise possess, and their heroic size dwarfs its proportions, while the contrast between their size and that of the numerous and comparatively diminutive stone statues of kings and saints in their immediate vicinity offends the eye.

K.—*St. Stephen's Hall*.—The twelve statues of eminent members of both Houses of Parliament selected by the Fine Arts Commission are all in place, and the windows are filled with stained glass approved by it, but the twelve panels, or rather compartments, which were intended for pictures are still covered with paper, which gives a somewhat mean appearance to an otherwise noble gallery. Considerable difference of opinion will be found expressed in the evidence taken by the committee as to the most effective mode of dealing with the eight wall spaces which the Fine Arts Commission intended to cover with representations of scenes from Parliamentary history. Strict adherence to the scheme of the Fine Arts Commission was advocated by some of the witnesses. Others recommended sculpture or inlaid marble decoration in colour, some urged that the panels should be filled with tinted bas-reliefs in gesso.

L.—*St. Stephen's Porch*.—This is the name given to the passage-way at the upper end of Westminster Hall and the stairs to Old Palace Yard. It contains two empty niches in which the Fine Arts Commission proposed to place statues of Marlborough and Nelson. The statues were the next work contemplated by the Commission at the time of its dissolution, and in their last report the commissioners expressed their confident belief that they would be at once proceeded with. Forty-five years have since elapsed but the niches are still empty. It is a curious fact that no statue of Marlborough is known to exist in any public building or open place in Great Britain.

M.—*The Corridor from the Central Hall to the Lower Waiting Hall*.—This corridor has six panels intended by the Fine Arts Commission to be filled by paintings of moderate size. None of these have been executed, and

the spaces meant for them are covered temporarily with the red flock paper so abundantly found in the Palace as a substitute for decoration. The light in this corridor is good, the passage itself, which gives the only public access to the committee-rooms upstairs, is during the session daily thronged. The committee consider this to be one of the places to be first attended to in any attempt to complete the decoration of the Palace. The committee will refer to this corridor again in a later portion of this report.

N.—*The Lower Waiting Hall* at the foot of the stairs is completed.

O.—*The Peers' Private Corridor*.—The walls of this corridor were regarded by the Fine Arts Commission as space available for frescoes. They are now concealed by book-cases and cupboards reaching nearly to the ceiling.

P.—*The Library*.—The four rooms composing the library are completely finished according to the original plan, and are therefore removed from the field of the committee's inquiry.

Q.—*The Dining Rooms*.—These rooms contain twenty-six panels, all of which were intended by the Fine Arts Commission to be filled with pictures, but which are in fact covered with red flock paper. For one of these panels, Sir E. Landseer's well-known picture of the *Monarch of the Glen* was painted, and he was also commissioned to paint three other panels. The sketches for these are believed still to exist, but the commission to the painter was subsequently cancelled. The light in these rooms is good, and the committee have no hesitation in saying that, in their opinion, the intentions of the Fine Arts Commission should here be given full effect, and that the work of decoration as contemplated by them should be proceeded with, however gradually, until it reaches completion.

R.—*The Upper Stairs Lobby, formerly known as the Poets' Hall*.—This lobby was decorated by frescoes representing scenes from the works of eight British poets, Chaucer, Spenser, Shakespeare, Milton, Dryden, Pope, Scott and Byron. With one exception all these have entirely or mainly perished. The one exception is *St. Cecilia*, an illustration of Dryden. This is not well seen, for a telephone box of huge dimensions and portentous ugliness has been placed immediately in front of it. One of the damaged frescoes, that representing *Lear and Cordelia*, might in Professor Church's opinion possibly be repaired, but the remaining six are absolutely destroyed. There are eight pedestals for statues in this lobby which are however unfilled. In this lobby and in that immediately below it the fine architectural fireplaces are disfigured by tables running right in front of them and serving, the one as a refreshment bar, and the other as a place of deposit for great coats and umbrellas. The general result of the committee's investigation throughout the building is that of 161 panels which it was intended to fill with paintings, 57 have been so filled and 104 remain blank. Of the statues contemplated 23 have been executed and 27 have yet to be provided.

In this survey the committee have not taken into account the numerous wall spaces in the corridors and committee-rooms, amounting to many hundred square feet, which the Fine Arts Commission undoubtedly proposed to employ as surface for painting. Practical difficulties would now in many cases attend the attempt to carry out these intentions, but the committee do not consider it necessary to dwell at any length on this topic, for in any case many years must elapse before any question respecting the decoration of these apartments can—perhaps under very changed conditions—come under the consideration of the advisory council or the First Commissioner. For a long time to come the completion of the more important and more public apartments will be amply sufficient to engage their whole attention.

The committee have felt some doubt whether Westminster Hall was intended to be included in the reference to them as one of the "approaches" to the House. It is, however, unquestionably so used. No general scheme with regard to Westminster Hall was laid down by the Fine Arts Commission, in the reports of which only vague allusions are from time to time made to it. But it is worthy of notice that in the evidence given by Sir Charles Barry before the House of Commons Committee of 1841 strong representations were made by him as to the desirableness of placing paintings or hangings on its walls, and that from various slight indications it is clear that the Fine Arts Commission did not consider Westminster Hall to be excluded from their sphere of action. The statues which are now in the Hall were not originally intended to be

placed there, but were found to be unsuited to their destined site in the Royal Gallery. They are equal of place where they now are. Their appearance is gruous and as a series they are incomplete. Their removal, the committee consider, be of distinct advantage.

Perhaps the most important duty devolving on a committee is that of recommending, as directed in terms of reference, in what manner the unfinished work of the Fine Arts Commission may be best continued and completed. This inquiry may be said to consist of two divisions—whether the original plan of decoration should be adhered to or departed from, and what may be the best method of carrying out practically whatever scheme may finally be adopted. By reference to particular galleries and corridors in the Palace of Westminster and to the approaches thereto, the committee have now reviewed the present unfinished condition of the decorations, and shown to what extent the scheme of the Fine Arts Commission has not been carried into effect.

The committee have heard evidence from many persons qualified to speak on questions relating to the work of the Fine Arts Commission, who were all agreed that the work of the Fine Arts Commission gave a great and healthy stimulus to art, which has been attended with lasting advantage. That the work now contemplated is likely to produce beneficial results. The witnesses, although they may have differed amongst themselves as to the best modes of decoration to be adopted, gave many valuable suggestions to the committee as to the manner in which the decorative work in the Palace could be continued and ultimately completed.

After careful deliberation the committee have come to the conclusion that it is not their duty to make detailed recommendations in detail as to how the work of decoration could best be carried out. They consider that it is questions on which there must of necessity be a divergence of opinion, and should therefore more properly be referred to the advisory council, the formation of which they advocate further on in this report. On the whole, however, after fully weighing the evidence given, as well as much other information derived from various sources, the committee believe that the best policy will be in the main to adhere, with such modifications as altered circumstances may require, to the programme sketched out in the report of the Fine Arts Commission of 1847.

The committee have heard evidence respecting the present method of mural painting as carried out in the Royal Exchange in London and in public buildings in France and in the United States of America, which suggests to them as to the permanence of the work thus executed. This evidence has convinced them that the scheme of decoration contemplated by the Fine Arts Commission may now be completed without any risk of the deterioration which has occurred in the case of the frescoes in the Lobby, to which allusion has already been made.

Abstractly considered, and with a view only to the artistic completion of the decoration of the Palace, it is probable that the revival of some such body as the late Fine Arts Commission with a uniform annual sum at its disposal would be the best instrument for effecting this purpose. But whatever may have been the case sixty years ago, it would probably be difficult at the present time to reconstitute such a Commission or to invest it with independent powers. It must be recognised that in the event of an annual grant being made by Parliament for the completion of the decoration in the Palace of Westminster, any decision with regard to the expenditure of that sum in the carrying out of the work would probably rest with the First Commissioner of Works as the Minister responsible to Parliament. The committee therefore consider it to be absolutely essential, in order to insure the continued progress of the work on systematic lines, that a small permanent advisory committee or council should be appointed to watch over the report on the progress of the work and to make suggestions in connection therewith.

Left wholly to himself, the First Commissioner, he happens to take a strong personal interest in the work, is exposed to many temptations to allow all decorative operations to languish. In any case, the mere pressure of other business and other interests may lead him to be indifferent to the subject and negligent of its claims. A desire to present economical estimates may cause him, as it has many of his predecessors, to abstain from proposing any outlay upon works of mere decoration. Or again, he may be a man who not only has no knowledge of art but actually despises and dislikes it—as has been the case

st one instance—not only will any future decorative be brought to a standstill, but works of artistic beauty y completed may be removed or destroyed, sacrificed at he may deem the claims of comfort or convenience. Great improvements in the decoration of the Palace ly carried out by the present First Commissioner t mainly in the removal of defacements made in the ither through want of proper advice or ignorance.

e appointment of an advisory committee, which the er would be bound to consult on all matters relating Palace, and which would have the right to make entations and offer suggestions to him, would not her obviate these dangers, but it would, in the n of the committee, go far to diminish them. It be the duty of this advisory committee annually to to the First Commissioner what had been done during st year, and what work should, in their opinion, be taken in hand, and this report should be laid both Houses of Parliament at the commence- of the Session. The recommendations made by the ry committee to the First Commissioner would prevent rgetting or avoiding the subject, and the annual ation of their report would tend to keep alive public st in their work.

e committee may be asked whether they contemplate mediate taking in hand of the whole of the works d to finish the plans of the Fine Arts Commission. e reply is that they do not. They attach far more im- ce to steady and slow persistence in the work than to id execution. A comparatively small sum spent ly every year will effect more than the grant of sums irregularly and uncertainly bestowed. The annually placed at the disposal of the Fine Arts Com- n between 1850 and 1861 was 4,000*l*. If only half m had been spent yearly during the forty-five years ave elapsed since the Commission ceased its labours oration of the interior of the Palace would probably e complete. The committee therefore suggest that n formerly appropriated to the work, viz. 4,000*l*. a ould be annually placed by Parliament at the disposal First Commissioner until the work of decoration is ed. The committee do not believe that the people of ntry would grudge the small annual expenditure which ecommend to complete the decoration of a building as intended to be not only the abode of their ture, but also the great national monument of their mentary history, and which, in the opinion of the ttee, is worthy of the purpose for which it was ed. The committee would also point out that the eeded for the completion of the decorative work in ace of Westminster would be minute in comparison e expenditure constantly incurred by the nation on oration of public offices, law courts and museums of e and art—buildings which, although no doubt worthy ect, cannot compare in importance or national interest e Houses of Parliament.

e committee have expressed the opinion that it will, ly speaking, be wise to leave to the advisory ttee, of which they have recommended the formation, gestions of a more detailed character. But they have y ventured to make some recommendations in their upon the different chambers they have inspected, ey desire to make a few others of a general nature.

e Fine Arts Commission at an early period of its ce laid down an absolute rule that all works under- ould be fully paid for by the State. The motives aused the adoption of this regulation are easily per- and entitled to respect. Nevertheless, the committee r the prohibition unfortunate and its policy mistaken. ecommend, on the contrary, that every effort should e to encourage the defrayal of the cost of works ivate sources. A good deal of evidence was taken ommittee with regard to the decoration of the Royal ge, the paintings in which have all been paid for y. In this case the subjects for the panels in the s of the Exchange were laid down by the Gresham ttee. They are 24 in number, and of these 15 have ecuted in the course of the last 12 years at the cost iduals or companies connected with the City. Is it h to hope that a similar result might be obtained by suit of a similar policy in regard to the Palace of nster?

ommittee strongly recommend that the paint with he greater part of the stonework of the Palace is now ould be removed. This has already been done e most pleasing result in many of the apartments

more immediately occupied by the House of Commons, and the committee cannot too earnestly advocate the extension of a similar treatment to the remainder of the building. They also recommend the immediate removal of the unsightly telephone boxes and refreshment bars which at present disfigure the two halls at the foot and at the top of the main staircase.

The transfer of the telephone boxes to a site only a few feet distant from that which they now occupy would in no way interfere with the convenience of the public and could be effected at very slight expense. The removal of the refreshment bars would cost more, but Mr. Norman Shaw has shown (not in his evidence, but by personal demonstration to the committee), how easily their transfer to an equally accessible position might be effected.

The committee recommend that the tinting process which has been most successfully applied to the statue of Sir William Harcourt in the lobby of the House of Commons, should be applied to the other statues in the building.

With regard to the completion of the work of decoration, the committee are of opinion that the two places which require first attention are St. Stephen's Hall and the Corridor M, from the Central Hall to the staircase. Of these two, St. Stephen's Hall is undoubtedly the most important, but in view of the difference of opinion, already referred to, with regard to the most suitable form of decoration for this hall, it will probably be found advisable to begin with the Corridor M, the compartments of which should be filled with paintings, as in the case of Corridor H.

Finally, the committee recommend that steps should be taken to secure the concurrence of the other House of Parliament. Not only is any progress in the contemplated work impossible without its sanction to the expenditure involved, but it must be borne in mind that as the occupant of more than half the buildings it is at least equally interested with the House of Lords in any question relating to the Palace, and that, though the committee, as in duty bound, have confined themselves to that which relates to the portions of the buildings more immediately depending on the House of Lords and the approaches common to both Houses, the subject of the completion of the unfinished work of the Fine Arts Commission is one which can only be adequately treated as a whole, concerning both Houses equally, and which can only be dealt with satisfactorily by their joint action.

## NATIONAL ART COLLECTIONS.

THE directors of the National Art Collections Fund have recently acquired the following works of art and other important objects for the national collections:—(1) Portrait of Morris Moore, by Alfred Stevens, purchased by a body of subscribers and presented to the fund, and by the fund to the National Gallery British Art, Millbank. (2) An oil-painting entitled "A Picnic," by Wilkie, the gift of Sir J. C. Robinson to the National Gallery British Art, Millbank. (3) Five German illustrated books of the sixteenth century, presented by an anonymous member of the fund to the British Museum through the National Art Collections Fund. (4) A copy of "Der Teutsch Cicero," printed by H. Steiner at Augsburg in 1535, with woodcuts by Breu, Schäufelein and Weiditz, the gift of Mr. Campbell Dodgson, for presentation to the British Museum. (5) Five thirteenth-century Persian lustred tiles, presented by Sir T. D. Gibson-Carmichael to the British Museum. (6) Three coins (the gift of Mr. Max Rosenheim) and two medals (the gift of Mr. Charles H. Read), presented to the Victoria and Albert Museum.

**Gloucester House, Piccadilly.**—The rebuilding of this well-known residence, which was formerly occupied by the late Duke of Cambridge, is now nearly completed from the plans and under the directions of the architects, Messrs. T. E. Collcutt & Stanley Hamp. The elevation to the Green Park and Park Lane is an imposing one of glazed Carrara, supplied and fixed by Messrs. Doulton & Co. Messrs. Drew, Bear & Perks carried out the constructional steelwork, and the fireproof partitions were supplied by the "Kulm" Partition Co. The general contractors for the building were Messrs. Patman & Fotheringham, builders and contractors, of Theobald's Road, Holborn, and Park Street, Islington. The work has been carried out in a very short time.

## ECONOMIC HOUSING OF THE WORKING CLASSES.\*

AT the outset I desire to express my sincere appreciation of the honour done me in calling upon me to act as President of the Section of Engineering and Architecture, and my hope that all who have gathered to this conference in the ancient and beautiful capital of Ireland will gain pleasure and profit in bountiful measure. Many, in approaching Dublin, travelled from Kingstown on one of the earliest railways in the British Islands, and it is interesting to remember that the first electric railway in Great Britain was that from Portrush to the Giant's Causeway, and that it owes its existence largely to the energy and enterprise of Dr. Traill, provost of Trinity College. The only railway on the Lartigue or mono-rail system in these islands is to be found in the West of Ireland, between Listowel and Ballybunion, and the latest ideas regarding mono-railways have sprung from the fertile brain of Mr. Brennan, a native of Connaught. Dublin is full of interest to the architect and antiquarian, and I regret to think no time has been set apart for a disquisition on the beauties of old Dublin by Sir Thomas Drew, who is a devout student and an eloquent expositor of them.

I should greatly desire to touch upon many points of interest to members of the Institute, with the view of indicating the progress made in matters affecting the public health and public convenience in recent years, but the brief time at my disposal may, I think, be most usefully spent in directing attention to what has been done in Ireland in connection with the great question of the housing of the working classes, which has engaged so much attention in these islands since the first Acts bearing on the subject were passed through Parliament in 1851 by the late Earl of Shaftesbury, whose successor now most worthily fills the high office of Lord Mayor of Belfast.

In this country, as in England, the younger members of the rural community, whose views of the possibilities of life have been widened by an education of a kind which was beyond the reach of their fathers, are not content to live on in their native environment, and flock in an increasing proportion to join the life of more varied interests to be found in towns where, though they as a rule do well on account of their superior physique and vigour, they cause a congestion in the labour market, and crowd out the feebler folk who constitute the unemployed and unemployable in the city. It has now been long recognised that organised efforts should be made to ameliorate the lot of labourers in the rural districts, and to help the working classes in our towns to live a healthy life. But it is in only comparatively recent years that the *laissez faire* policy has been frankly abandoned in connection with this question, and there are many who are still of opinion that, unless satisfactory balance sheets on a commercial basis can be produced with regard to such schemes, they should not be undertaken. Public opinion now, however, generally agrees with Goldsmith, that

Ill fares the land, to hastening ills a prey,  
Where wealth accumulates and men decay,

and while we have not yet re-enacted the statute of the 31st year of Elizabeth, which provided that no cottage should be erected without having four acres of land attached to it, the attention of Parliament has been steadily directed in recent years towards measures calculated to improve the dwellings of the people.

The waste of capital and revenue involved in the conditions of life in slums or insanitary hovels is now being generally recognised, and the perils to all classes of the community caused thereby have become manifest. We cannot afford to allow such conditions to exist, and it is the truest economy to remove them. Professor Koch says:—

"It is the overcrowded dwellings of the poor that we have to regard as the real breeding-places of tuberculosis; it is out of them that the disease always crops up anew, and it is to the abolition of these conditions that we must first and foremost direct our attention if we wish to attack the evil at its root and wage war against it with effective weapons."

In 1895 Dr. Bowmaker attributed the want of success in the application of the Housing of the Working Classes Acts to apathy on the part of local authorities, who, he stated, were unwilling to take action to remedy unsatisfactory conditions, or even to prevent the growth of such conditions. Alderman Thompson, in his invaluable handbook on housing, explains this apathy to some extent by stating

\* Presidential address by Mr. P. C. Cowan, B.Sc., M.Inst.C.E., read at the conference of the Sanitary Institute in Dublin.

that the local authorities dare not carry out the Health Acts for fear of inflicting worse evils upon them than they endure at present.

In 1900 the Local Government Board pointed out that local authorities should have a house-to-house inspection of their districts to ascertain what nuisances call for removal and what houses are unfit for human habitation. I am not aware of any really effective action in this respect outside a few of the larger English cities. There is no doubt that the primary need in the case is efficient legislation. In the report of the Select Committee on the Housing of the Working Classes Acts Amendment Bill, lately published, it is stated:—

"The house famine in town and country which exists in regard to the working classes is incontrovertible. The many investigations, royal commissions on housing and labour, &c., select committees of the House of Commons and official departmental reports have placed the fact beyond controversy," and also, "that however cheap cottages may be built, they cannot be erected in the rural districts . . . so as to cover interest and principal and the usual annual outgoings within the rent-capacity of the labourer."

There is a special reason why a liberal policy is needed in Acts affecting agricultural labourers in Ireland. Reports of Mr. Wilson Fox, Labour Commissioner for Ireland, Board of Trade, show that the average rate of earnings per week (including all allowances in kind) of agricultural labourers in Ireland in 1898 was less than two-thirds the average rate in Great Britain, and ranged from 8s. 6d. in co. Mayo to 12s. 6d. in the counties of Antrim, Down and Dublin. In July 1906, before the Select Committee on the Housing of the Working Classes Bill, Mr. Wilson Fox produced evidence that rural housing cannot at the present time be developed upon an economic basis without some form of subsidy or cheap loan, and that, even with a six per cent. subsidy for a loan at 2 per cent., a cottage costing £150 should be let at 2s. 6d. a week to cover the interest charges, rates, taxes, water supply, repairs, insurance and collection.

The first Labourers (Ireland) Act was passed in 1906, and at March 31, 1906, 20,634 cottages had been built, and 887 were in course of erection. For these cottages amounting to 3,415,280l. were sanctioned, equal to 159l. per cottage with plot. These loans are repayable by an annuity, covering interest and sinking fund, of 4l. 10s. per cent., with a period of fifty years.

By the Labourers (Ireland) Act, 1906, a great improvement in the financial facilities for building cottages was effected, and the district councils may now obtain loans exceeding, in all, 4,250,000l., repayable by an annuity of 3½ per cent., and the Government has agreed to take to pay 36 per cent. of the loan charges, so that only 64 per cent. of 3l. 5s., or slightly less than 2 1/2 per cent., will be payable by the district councils for interest and repayment of the loans, for which the period is 68½ years. During the passage of the Bill of 1906 it was stated that the cost of a cottage and plot should not exceed 170l. On this assumption the 4½ millions made available should provide for the erection of 25,000 cottages and plots.

With a rent of 1s. 3d. a week for a cottage and plot costing 170l., a deficit of 5l. 0s. 2d. on loan charges was inevitable until the Act of 1906 was passed, but, under the terms of that Act, a similar deficit of only 5s. 9d. per cottage will fall upon the local rates. Of course, in the case the cost of maintenance, insurance, collection, &c., in addition, to be met by the local authority. Mr. Wilson Fox puts these charges, along with water supply, at 10s. a year, which is probably too high for Ireland.

Between 1883 and 1906 an annual Government grant of 36,811l. was distributed in Ireland, to be applied to the cost of providing cottages under the Labourers' Act. The allocation was made in proportion to the expenditure on roads and bridges in the various counties, and as expenditure bore no relation to the urgency of the housing question, or the expenditure incurred in connection with the amount available from this grant for relief of local rates in respect of each cottage provided varied from 11s. in co. Meath, where 1,589 cottages had been provided by November 1, 1906, to 18l. in co. Armagh, where cottages provided only numbered fifty-nine.

Under the Act of 1906 this annual grant is reduced to 30,811l., and will now be distributed according to the number of cottages actually provided prior to November 1, 1906. It will relieve the local rates to the extent of 17s.

for each cottage provided before the loans were obtainable on the very special terms of the new Act. Up to 1906 only about 2 per cent. of the total number of cottages was erected in Connaught, and less than 10 per cent. in Ulster. In the latter province a number of cottages with weaving-rooms attached have been erected for hand-loom weavers of linen.

The rents now charged throughout the country for a cottage and plot of at least half an acre provided under the Labourers (Ireland) Acts, vary from 6½d. to 2s. 6d. a week, the general average being 11d. a week; but in Mr. M. O'Sullivan's excellent book on these Acts 1s. 3d. a week is indicated as an average rent which might fairly be expected. It was apparently never expected that the rents would meet the annual charges fully, and the original Act provides that the district council may levy a rate not exceeding 1s. in the £ for the purposes of the Act, and this limit was closely approached in recent years in parts of the counties of Cork, Limerick and Waterford.

In the report of the select commission already referred to, the opinion is expressed that the difficulty as to rent would be largely diminished by the addition of land to the cottage, and one witness, who has given great attention to the study of rural conditions in England (Mr. Rider Haggard), said:—"The real solution of all this cottage question is small holdings; give the men some land—a small holding—and they will soon find their own houses."

Opinions I think widely differ on this point; much evidently depends on the quality of the land and its proximity to good markets. Small holdings are very plentiful in Ireland, and the results are not altogether satisfactory. So far as I can learn, the wisest view as to the Labourers (Ireland) Acts is that the most pressing part of the work to be done is to supply sanitary houses of moderate dimensions and cost with a reasonable garden plot, and that there is a danger, if great economy is not exercised, that, even with the facilities of the Act of 1906, the task will become impossible on account of the great disparity between outlay and revenue, and the large number of cases to be dealt with.

Until the present year designs for cottages under the Labourers (Ireland) Acts were prepared by architects for the local authorities, in accordance with simple general requirements framed by the Local Government Board; but, in accordance with a somewhat general desire, the Board has now issued a set of eight plans for houses with three or four rooms, and a general form of specification which contains a number of alternative clauses to suit varying local conditions.

Four of the plans were obtained by means of an open competition, the terms of which called for a kitchen and three bedrooms, an open shed and simple pail closet, a height of ceilings on the ground floor of eight feet, and a minimum net cubic capacity in the rooms of 3,300 cubic feet, at a cost not exceeding 130%. All the prize plans are for one-storeyed houses, and the particulars as to gross and net cubic contents are as undernoted:—

	First prize design. Cubic feet.	Second prize design. Cubic feet.	Third prize design. Cubic feet.
Cubic contents of building (excluding out-offices), taking outside dimensions on plan and height from mid-level of foundations to mid-level between eaves and ridge . . . . .	7,500	6,255	7,223
Net cubic contents of each room:—			
Living-room . . . . .	1,500	1,203	1,305
Bedroom A . . . . .	975	614	938
"    B . . . . .	975	918	650
"    C . . . . .	900	612	650
Total . . . . .	4,350	3,347	3,543

About 400 sets of plans were submitted in the competition, and many of the designs were of considerable merit. Those selected have been very freely criticised, and some interesting letters and original designs have recently appeared in the Dublin newspapers. It will, I think, be readily conceded that any such plans would be open to adverse criticism. Some critics urged extreme provisions as to ventilation and others laid stress on the value of cosy corners. Nearly all the criticisms and suggestions were, however, of some value, and it is to be hoped they will aid in the solution of the difficult problem how to secure a satisfactory labourer's cottage at a cost which bears a reasonable relation to the rent obtainable and to the available financial resources.

Two enterprising firms of contractors have erected, for the Home Industries Committee, at the Irish International Exhibition, cottages on the designs which obtained the first and second prizes in the competition, but it is probably only fair to them to state that the time afforded for erection was very limited, and also that the roof of the second prize cottage as erected is higher than, and not quite so picturesque as, the roof shown on the premiated plan. I understand that these firms are prepared to erect cottages according to the prize designs, with or without slight modifications, for a price closely approximating to the sum of 130% already referred to; but of course, to secure a low cost, they would probably require to have a contract for a considerable number of houses. In co. Cork contracts have already been taken for the erection of a number of cottages, according to the third prize design, at less than 130% for each cottage.

In Ireland, as might be expected, the operations of the sanitary authorities, as to building houses under the Housing of the Working Classes Acts, have not been very extensive, though the attention of the various councils has been carefully directed to the subject.

The Act of 1903, which gave added borrowing powers for this purpose, does not extend to Ireland, and, except in the case of the county boroughs and a few urban districts which obtained local Acts, the main difficulty has been one of borrowing powers. No Government grants or special terms for loans are obtainable under the Housing of the Working Classes Acts, and at present 4 per cent. is the rate charged for interest only on Government loans for a period of forty years.

Up to March 1906 the local authorities in Ireland under these Acts provided accommodation for 4,279 families, at a cost of about 180% per family, or 789,874% in all. The average rent is about 2s. 4d. a week, and the average annual loss about 3% 5s. per annum. In the Dublin district, including the townships, most interesting examples of municipal effort in this direction can be seen; and the magnificent rehousing schemes of Lord Iveagh are worthy of special attention, as are also the varied and able designs of the city architect. In the Dublin district the Dublin Artisans' Dwelling Co. has provided 3,500 excellent dwellings, at a cost of about 600,000%; and if to these are added the dwellings provided by the Iveagh and Guinness Trusts, the Suburban Artisans' Dwelling Co. and the Association for the Housing of the Very Poor, a total of 4,665 dwellings, costing about 750,164%, is reached. It is interesting to observe that these associations have provided more houses in the Dublin district than have been provided by other town authorities in the whole of Ireland.

I would here draw attention to a few points in the recommendations of the Select Committee on the Housing of the Working Classes Acts Amendment Bill, which appear to be of very special interest. It should be noted that in England and Scotland these Acts apply to rural as well as to urban districts. This committee recommends:—

- (1) That the administration of the Public Health and Housing of the Working Classes Acts should be transferred from the Rural District Councils to the County Councils.
- (2) That a great improvement in sanitary inspection should be provided for, and requires the appointment of a staff of county sanitary inspectors, who should be properly qualified whole-time officers and act under a county medical officer of health, who should also devote his whole time to his public duties.
- (3) That a register of survey of all buildings intended for human habitation should be compiled and revised periodically.
- (4) That the County Councils should make by-laws for every district.
- (5) That the Local Government Board should appoint a special housing and public health department, with a staff of travelling sanitary and housing inspectors to supervise the administration of the public health and housing laws by the County Councils and their executive officers.
- (6) That the Treasury should lend money for the purposes specified in the report, at the lowest rate at which the Treasury can borrow (a) to local authorities, up to the full amount of the security; (b) to public erecting societies, up to 75 per cent. of the security.
- (7) A simplification and codification of the laws under the Public Health and Housing Acts.

The select committee expresses surprise that the Housing of the Working Classes Acts have not been applied to a greater extent for the adaptation of old buildings, but experience in Ireland has shown that as to rural districts such adaptation is usually less economical than new building.

The great influence of a good caretaker on the condition of working-class dwellings, and on the cost of maintenance,

is not sufficiently regarded, and I am convinced that a city may possess an abundant supply of cheap houses in fair condition, and yet be in great part insanitary on account of the domestic habits of the people. An improvement in these habits is urgently required, and can only be secured by education in simple hygiene and a much more rigorous inspection of the sanitary condition of houses than is now provided for. The Swiss method of collecting along with the rent a fixed sum for repairs, and returning to the tenants at the end of the year any portion of such sums not actually expended, has much to recommend it, as it tends to secure "the stitch in time." Local authorities in Great Britain and Ireland require additional powers to regulate the laying out of streets and buildings on the outskirts of the towns, to prevent them from being encircled with mean streets.

As to the provision of new houses for the working classes in towns, the operations of voluntary societies or companies should probably be looked to as the most hopeful factor, and it is most desirable that such operations should be aided as far as possible by the State.

### "HOW ARCHITECTS GET WORK."

THE New York *Sun*, a metropolitan newspaper of standing and large circulation, has recently published an entertaining article explaining "How architects get work," and has done it good-naturedly, truthfully, and in a manner that will really interest the general reader. More than this, it may well cause the man on the point of placing a job in an architect's hands to stop and consider how well-advised his action really is, and just what are the motives or whence come the impulses that are guiding his action, and this may cause the loss of a job here and there to a reasonably able and deserving architect; for often there is no very good reason for the selection, or rather the selection has actually been forced on the owner by an adroit architect or the still more adroit "promoter" whom he employs. It is in dealing with the promoter that the writer of the *Sun's* article becomes most interesting, for, among other things, he shows, says the *American Architect*, how a certain architectural firm is on the high road to much wealth, and will assuredly arrive at their goal unless their promoter, who is associated with them as a partner, should chance to ruin his health through the drinking of much tea at afternoon functions; for it is through his charming manner, his consummate social address—which finds ample play during his assiduous attendance at social occasions—that he succeeds in knitting the links of the chains that draw wealthy and desirable clients to the doors of the office where his partners, the real architects, are waiting, ready to serve whomsoever may come.

How should an architect get his work? It is a serious question that each beginner has to ask himself, one that has been put to us more than once. There is but one answer, and that is he must be "known of men." But this hardly helps, as it simply causes the query to be changed so as to read, How may an architect make himself known? In a certain number of cases the answer comes naturally, and in course of time the draughtsman who is of the right stuff to make an architect, and who has proved himself of exceptional value to his employer, is taken into partnership, and his name thenceforward becomes as well known as that of his partner. But the men who become known in this way are usually men who, though capable and well educated, have to depend on their daily wages, and so are rather forced to graduate from the bench, as it were. But there are others willing to take more risks, perhaps more confident in their real powers, or, happily, possessed of independent incomes, who do not care to wait to be known until middle age overtakes them, but wish to gain name and fame and money while young. How shall these be known? They cannot advertise in a commercial way as can business men, since it would be "unprofessional," and such advertising as can legitimately be done on a door-plate is not likely to be very productive. If they are unwilling to adopt the old-fashioned course of establishing themselves in some new community, growing up with it, becoming known therein by daily intercourse with their fellow-citizens and satisfying their needs as they develop, then there are only three ways open—to make an alliance with a speculating builder, to seek success by constant participation in competitions of all kinds, or, frankly, to tout for work.

Of these three methods the first is dangerous, as it almost inevitably leads to a lowering of the moral tone and

a debasing of artistic and ethical standards; the second is absolutely professional, and, in spite of the manner in which established architects talk against the method, is altogether too good ever to be abandoned. As to touting, there is much more of it done than architects will be ready to admit, for methods of touting are almost as various as men are numerous, and methods one man would employ would be scorned by his neighbour; and yet most of the methods actually used are permissible, decent and professional. The method that is at once the most legitimate and most successful is social touting, which consists simply in mixing with one's fellow men as often and as widely as possible through membership in one or more clubs, in becoming an active member of a church congregation and in taking part in such social functions as are accessible. And it is for this reason, we fancy, that Sir Aston Webb reminded the architectural students of the Massachusetts Institute of Technology that they should take care to acquire a broad and general culture, quite as much as skill at the drawing-board. The cultivated man in society will become known—and so draw to himself chances of securing work through and because of his displayed intelligence—in a way quite beyond the grasp of his fellow who has scorned to spend time and means in acquiring knowledge that did not lead by the shortest route to bread and butter.

But when all is said, the best agency for becoming known, the one that has had an effective part in the upbuilding of every architectural reputation in these days, is nothing more nor less than the printing press. It is the legitimate advertising given, without pay, by newspapers, magazines and professional periodicals that has made familiar to readers in every part of the world the names of architects in association with their accomplished deeds. It is quite common for architects to say that they derive no benefit from the publication of their work in the pages of the professional Press, because the circulation of these among the general public, the mass of possible clients, is very limited. This argument is good, so far as it goes; but if the periodical Press does not widely reach the general public, it does reach the editors of newspapers and magazines, and informs them as to who is who and what is what, and from that point they carry on the free advertising in a more effective way. In other words, publication in the professional journals is the first step on the pathway of the only form of advertising that is open to the profession. The last thirty years has witnessed the appearance and the disappearance in this country of a bewildering number of architectural journals, and the editors and publishers who have lost health and money in these undertakings are remembered only with pity, if not with scorn; and yet what they did, while they were able to do anything, was really to give substantial aid to the making of the reputation of many an architect who, now that it is made, fancies it is wholly due to his own transcendent genius.

### ST. ALBANS CATHEDRAL.

ALTHOUGH the late Lord Grimthorpe expended a large sum of money on the conversion of St. Albans Abbey into Denisonian Gothic some parts escaped. One was the ceiling of the north aisle, which it is now proposed to vault in order to be in keeping with the south aisle. One of the promoters is Mr. H. J. Toulmin, who explained the proposals to a representative of the *Herts Advertiser*—

"This matter," he said, "has been in my mind for the last fourteen years, ever since Lord Grimthorpe finished his alterations. This roof is really the only structural part of the work which Lord Grimthorpe left undone. Personally, I consider the north aisle rather a maimed object and a blot and a blemish upon our grand old cathedral, of which, I am sure, we are all justly proud. If the county has been saved a very large expense during the past fifteen years in consequence of the generosity of Lord Grimthorpe, I do not think it will be asking too much of them now to provide the necessary means for carrying out an improvement which I am sure will make St. Albans Cathedral second to none in the country. Of one thing we may be sure, and that is that the work will be carried out with judicious care and with full regard for what is most in keeping with the architectural features of the abbey, for it has been decided to have it executed under the direction of Mr. John Oldrid Scott, in whom, from past experience, we have full confidence."

The promoters of the scheme cautiously avoided making any appeal until the Bishop's desires in regard to the Bishoprics Fund had been fulfilled. Now that the sum necessary for the rearrangement of the dioceses of Herts

and Essex has been achieved, they are giving the people of the county an opportunity of putting the great county church into proper order and of making it worthy the high position it holds. *Apropos*, it was recalled by Mr. Toulmin that he one day asked the late Sir Gilbert Scott in what order he placed the cathedrals of England, and the reply of the great architect was significant. "I put Lincoln first as queen of the cathedrals," he said, "and I put St. Albans next as the cathedral of the greatest interest."

The cost of the work it is now proposed to undertake is approximately 4,500*l.* That is the sum which Mr. J. Oldrid Scott estimates it will be, and that is the amount for which the committee, with the full approval of the Lord Bishop of the diocese, are appealing. Already several substantial promises have been received.

For the primary restoration of the cathedral, for which scheme the Dean and Mr. Toulmin acted jointly as honorary secretaries, a sum of between 30,000*l.* and 40,000*l.* was raised, and this included the purchase from the county of the old monastic gateway. Then Lord Grimthorpe came along and made a further expenditure of 150,000*l.* upon the fabric, which, thanks to his princely generosity and to the watchful care which the Dean and his churchwardens have for years exercised, to-day promises to stand for many more centuries to the memory of Britain's proto-martyr.

Matters of detail, such as the painting of the roof of the nave and the filling of the great west window with stained glass, which it is estimated would cost about 1,000*l.*, were also referred to by Mr. Toulmin as desirable; but these, he thinks, may be left to the voluntary efforts of private individuals. "I love the dear old abbey," he said, "and I am very happy in doing what I can for it. My great-uncle, who lived where Bank House now is, used to plant his pear trees and plum trees against the abbey and hammer the nails by which they were supported into the walls of the abbey; and it has fallen to his great-nephew to do what he can to compensate for that."

#### The "Noise Fiend" of the Metropolis.

SIR,—In regard to the assumed objectionableness of noise, I think that perhaps Mr. T. B. Green does not indicate the source of any righteous annoyance created by his "fiend." And perhaps, too, Professor Petrie is not the safest guide, as his time is so largely engaged in the vast silences of Egyptian exploration.

It is safe to assume that Mr. Green refers to the motor traffic of our streets, and I have yet to learn authoritatively that the national health is seriously impaired by noise and odour. We who are living in this twentieth century would do well to remember that our great-grandparents were subjected to the ordeal of noises and stench to which we are strangers, and yet, 100 years ago, numerous instances (too numerous to form exceptions) of longevity occurred.

Besides, Sir, is not the objection to the noise of street traffic a purely personal idiosyncrasy? Does not the bustle and roar convey an impression of humanity in the making, which proves a panacea for any incipient trial to the nervous system?

I commenced by doubting whether Mr. Green has indicated the source of reasonable annoyance, and to this I will now revert. Whilst advocating liberty of noise-creation where the business of a city is concerned, I have my grave doubts as to the justification for intramural disturbances of the peace. Has one neighbour, have a dozen neighbours, the right to foreshadow Hades by the mechanical horrors of the pianola and the tin-kettle outpourings of the gramophone? And yet, Sir, here again it has been seriously urged that a neighbour so acting, and generously leaving his windows open towards the thoroughfare, confers an inestimable boon on his fellow-sufferers—I mean his fellow-men.

By this means and that, we are therefore brought to the practical objection—which we find to consist not in noise, but in danger to life and limb; and here I should be glad to think that Mr. Green and I are on common ground. In the interests of general progress, the Car of Juggernaut Motor Bus Company, Unlimited, may be a necessity; but Parliament should not have allowed the

user of the streets for mechanical traffic by the general public. The G. P. is radically selfish taken in sample; and as long as No. 1 can travel his so many—so *very* many—miles an hour for gratification of self and companions, it matters little how many four-footed beasts—and incidentally, two-footed *beasts* also—are injured by the way. I say advisedly that selfishness has received a great impetus to growth since private motor traffic has been legalised. The motor-fiend apparently takes as his motto one from Omar Khayyam's "Rubaiyat," and tries to believe he is acting unselfishly:—

Why! if the soul can fling the dust aside,  
And naked on the air of Heaven ride,  
Were 't not a shame, were 't not a shame for him  
In this clay carcase crippled to abide.

"And," adds the motor-fiend, "I'll help him (the soul) out of his clay carcase." Apologising for the length of this letter,—Yours, &c.,  
PERCY L. MARKS.  
10 Matheson Road, West Kensington.

SIR,—The thanks of the community at large are due to you and your correspondent, Mr. Thomas Bowden Green, for the letter which appears in your last issue. The noise and stench caused by the motor omnibus and electric trams are abominable, and property is being depreciated to such an extent that the matter is getting a serious one. The noise in Holborn, one of our great highways, is beyond description, and if I desire to have converse with a client I have to shut my windows before I dare attempt it. Our "benevolent" Government with its enormous majority might surely take the matter up and earn the everlasting gratitude of one who has nothing to thank them for at present.—Your obedient servant,  
T. SQUARE.

#### Trade Touting.

SIR,—Possibly the enclosed cutting from *The Timber News* may interest many of your readers. Probably the builders concerned have overlooked the fact that there is such an individual as the architect, and that he usually has something to say in the matter; and that clients who have to pay usually take some interest in the question also, and, my experience is, have a wholesome dislike to all "rings" and "combines." At any rate this is the experience of—  
Yours, &c.,  
FAIRPLAY.

#### "Inter-Trading Touting."

"It would appear that the Manchester timber trade has been pretty well circularised this week by a Mr. Robert Hall, who states that he is the organising secretary of the Manchester, Salford and District Building Trades Employers' Association. The gist of his circular is that, as he is anxious to increase the membership of the Association, he begs to draw the attention of our merchants to certain rules which this Building Trades Association has seen fit to adopt, and known as inter-trading rules. For the benefit of our readers in general we herewith reproduce these, which are very strongly emphasised on the circular by being printed in red ink. They read as follows:—

"(a) That we, the members of the Manchester, Salford and District Building Trades Employers' Association, hereby mutually agree not to give or take tenders to or from or otherwise employ or deal with regular employers in the building trades of this district who are not members of this Association, or with a regular employer of any other district who is not a member of the County Federation or some other branch of the National Federation of Building Trades Employers, to which this Association is affiliated.

"(b) We also agree when placing an order for building materials in this district to do so with a dealer or manufacturer who is a member of the Association if practicable, and will in all cases give such members reasonable preference. Should it become necessary to place an order with a non-member either of this or of any other district, we will use all reasonable efforts to induce the firm to join this or some federated association."

"Now, then, we think the trade will agree with us that there is a veiled threat attached to this, and so far as we have been able to sound members, Mr. Hall's circular, instead of creating a friendship towards his Association, is likely to do the opposite. Would it not, by the way, be better for this Association to endeavour to secure as members the bulk of the builders of Manchester, Salford and district? Their present list of members is a remarkably short one, and if there is room for improvement we should say it ought to take the direction we have indicated. However, this secretary is evidently of opinion that guineas will

be obtained a good deal sooner from timber merchants, hence his worrying us. Coupled with the veiled threat there is, of course, a promise of good things to come foreshadowed in these so-called inter-trading rules, but even this will, we think, be insufficient to induce any considerable portion of the trade to adopt this organising secretary's suggestions. If we can offer a further suggestion, it is that the Manchester Timber Trades Association should adopt some sort of an inter-trading or preferential rule, and appeal to the local builders to become members. In fact, this could go on *ad infinitum*, and we might all make a living by soliciting subscriptions from each other."

### GENERAL.

**Mr. George Washington France**, of Huddersfield, architect to the West Riding County Council, was killed in a motor-car accident about six miles from Doncaster on Monday night. He was thrown out of the car and died almost immediately. Mr. France was in his fifty-third year.

**Mr. Edward H. Bruton, F.R.I.B.A.**, informs us that he has taken Mr. F. Burwell Foster, A.R.I.B.A., architect, of Weston-super-Mare, into partnership, and the firm will be carried on at 119 Queen Street, Cardiff, as Messrs. Bruton & Foster.

**At the Monthly Meeting** of the lately formed Street Noise Abatement Committee on the 31st ult., the Secretary mentioned that during August a considerable number of banks and insurance companies in the City and West-End had attached their names to the petition to the Home Secretary respecting the undue noise caused throughout the Metropolis by motor-omnibuses and traction-engines. The petition, it was stated, had now been signed by more than 100 bank and insurance managers, principally on the ground of the enormous depreciation in the value of house property on every route taken by motor-omnibuses.

**The Wallasey Council** will be asked at their next meeting to consider the following resolution:—"That this Council invite the submission of designs for new public offices (only) to be erected on the North Meade site at a cost of not exceeding 35,000*l.*"

**The Southport Education General Purposes Committee** recommend the Council to erect a boys and girls' school on a site of from eight to ten acres of land belonging to the Corporation in Park Road.

**The Pre-Roman Fort of Wincebeorh**, on the road from Salisbury to Shaftesbury, has been sold. The fort which was known in Anglo-Saxon times, is an entrenchment of 12½ acres, girt by a single ditch and a rampart 39 feet high. General Pitt-Rivers discovered in it an Anglo-Saxon cemetery, and removed many skeletons.

**The Carnegie Dunfermline Trust** and the Burgh School Board have authorised their joint art committee to engage a drawing master at a salary of 150*l.* per annum. His chief duty will be to visit the schools of the burgh and to supervise the teaching of drawing. The aim of the committee is to assist the ordinary class teacher to bring the subject of drawing into accord with the most approved methods, and to secure that the teaching of the subject shall be linked as closely as possible with the advanced work of the special technical and craft classes held in the evening. The School Board and the trustees will each contribute one-half of the salary.

**Mr. W. H. St. John Hope**, in reporting progress of excavations at Silchester, states that during the exploration within the last few weeks of one of the insulæ near the middle of the town, there has been uncovered the remains of a small square temple. The ground plan is quite perfect and shows a podium about 18 inches high and about 36 feet square outside, with a wide entrance on the east and a cella measuring internally 12 feet by 14 feet. The podium is paved with coarse red mosaic, but the floor of the cella has been destroyed; it was perhaps of fine mosaic laid on a bed of opus Signinum. Against the west wall of the cella is the base of a platform about 3 feet broad for the image of the deity. On and about this were found some of the shattered fragments of the image itself, which was about life-size and of stone. Several important architectural fragments have also come to light, but more of these are wanted to enable a reconstruction of the temple.

**A French Amateur, M. Audesud**, who died lately in Cairo, has bequeathed his large fortune and his valuable collections to the Louvre.

**The Manchester Art Gallery Committee** recently organised an exhibition of pictures illustrating childhood. In six weeks it was visited by 70,000 school children. The experiment being deemed a success, the committee have purchased eleven of the water-colour drawings to form the nucleus of a permanent collection in a "childhood gallery," and the Friends of Art Society have followed this up by purchasing four more and handing them over to the city authorities.

**The Old Monkland School Board** have resolved to proceed with the erection of a Higher Grade school in Albert Street, Coatbridge, where an eligible site has been secured. By a majority of six to four, the competitive plans of Messrs. H. & B. Barclay, architects, Glasgow, were adopted. They show an estimated cost of 15,230*l.* Premiums were awarded as follows:—Thos. Baird, jun., Glasgow, 20*l.*; Andrew Balfour, Glasgow, 15*l.*; James Shaw, Coatbridge, 10*l.*

**A Local Government Board inspector** (Mr. P. M. Crosthwaite, M.Inst.C.E.) sat at Portsmouth last week to inquire into the proposal of the Town Council to borrow the sum of 24,000*l.* for the purpose of extending the borough asylum, the idea of the asylum committee being to erect four villa blocks for the accommodation of the patients. Mr. Cogswell (of the firm of Rake & Cogswell) explained the plans, and informed the inspector that the buildings would be of very simple construction and as cheap as was possible.

**The Dean of Guild Court** have passed plans for the erection of an extensive linoleum factory at Pathead, Kirkcaldy, for the Fife Linoleum Co., Ltd. The factory is to be built of brick with redstone dressings, and will be fitted with the most up-to-date machinery. The building is to be four storeys high, while the main chimney-stalk will be about 180 feet in height. The site of the building is in Commercial Street and Mid Street, Pathead. Messrs. J. D. Swanston & Syme, Kirkcaldy, are the architects, and a start has already been made with the erection of the building.

**The Plans**, specifications and details in general in connection with the reconstruction of the South Parade pier, Southsea, are complete, and Mr. C. W. Ball, of Southsea, has been appointed at 1½ per cent. to take out the quantities.

**The Purchase** has been completed by the Manchester Tenants, Ltd., of a plot of land, comprising over 53,000 square yards, fronting Burnage Lane, Burnage, for the purposes of a garden city.

**At a Meeting** of Kilmarnock Parish Council attention was called to the way in which an architect had been appointed for the proposed extension at the Cuninghame Combination Poorhouse. The directors invited competitive plans and the assessor chose three in order of merit. Subsequently the Local Government Board examined all the plans, eleven in number, and selected one that was not in the assessor's three. Finally, the plan adopted for the work was neither the one chosen by the Local Board nor the one that got first prize from the assessor, being in fact the one that was placed third. The chairman ruled that the matter could not be discussed at that meeting. Notice of motion on the subject was given for next meeting.

**The North Bridge**, crossing the river Hull about a mile from its junction with the Humber, and serving one of the busiest thoroughfares in the city of Hull, has recently been reconstructed. The bridge consists of two main outside girders, 7 feet deep and about 80 feet in length, placed at 19 feet 6 inch centres, and of the lattice type with cross girders carrying the main roadway. There are two sets of tramway lines on the main roadway, and to accommodate foot traffic two footpaths, 8 feet wide, outside the main girders and carried by cantilever brackets, are provided. The contract involved the conversion of the close lattice girders into N girders by cutting away the existing stiffeners, substituting much heavier verticals, and introducing an independent set of diagonals, the existing latticing being retained as a screen. The flanges have also been strengthened by extra plates, and new N plates have been fixed on the approaches and on the bridge. The bridge was closed for four weeks, and during the work of reconstruction a temporary footbridge, with a lift span for allowing traffic on the river to pass, was erected over the permanent structure.

# The Architect.

## THE WEEK.

It is satisfactory to know that the foreign protests against the neglect of the Alhambra have not been useless. The Spanish Government have placed the buildings in charge of Señor ZAVALA, architect, and he has lost no time in reporting about the measures which will have to be undertaken. During several centuries rubbish has been allowed to accumulate both within and without the walls, which were not designed to resist such a pressure. The rubbish also concealed some parts of the plan. For instance, it was not known that at the foot of the Hachabi tower there was a door from which steps descended into a mysterious passage, which has yet to be fully explored. It was probably part of a secret communication with the different buildings. It is feared that some new slabs of marble will have to be introduced in the Lions' Court. The fountains are likewise out of order, and it is considered that, owing to the absence of regular conduits and drains, the substructure is suffering from damp. In order to form a bath one of the governors of the Alhambra in the eighteenth century caused much destruction by introducing great balks of timber wherever he thought necessary. According to Señor ZAVALA the Alhambra resembles an invalid. But though there may be suffering, with care the last hour can be staved off.

The house which stood on one side of the Place Pigalle in Paris had for tenants on the first floor J. HENNER and PUVIS DE CHAVANNES. Their studios had some of the characteristics of the two artists, who differed not only in appearance but in the theory and practice of art, have been before now described in *The Architect*. Several artists who had to make a reputation occupied the upper floor. So unpretending a building is not considered suitable for the present generation of artists, and it is likely to be taken down and converted into a restaurant, although there are several within a few yards. HENNER was a typical Alsatian, speaking slowly and never pretending to imitate the accent of Parisians. "M. PUVIS," as his pupils and assistants used to call him, might have been a French baron and one of the stars of society. There was little communication between the two men though they lived on opposite sides of a narrow corridor. But both held to their ideals regardless of opposition. One of the first works of M. PUVIS presented Gambling, and was to be presented to a Paris club. But when it was seen the wits said it was purely symbolical, for the figure was bodiless and could have no heart. To the end of his life the painter was different to ordinary anatomy, and thought more of the ideal than of bones and muscles. HENNER found that the world preferred to have figures in profile with their nebulous contours than mere exact representations, and though they seemed easily produced, they were slowly, and it may be painfully, elaborated.

The site of the infirmary in Manchester continues to perplex the City Council. Economy has to be considered, and there are advocates of different ways of utilizing the ground. The special committee entrusted with the investigation recommend that designs should be obtained from architects in competition showing how the site could be appropriated for a public library and gallery. The city architect, Mr. PRICE, considers that there cannot be the slightest doubt that the existing infirmary will not bear to be adapted for an art gallery, museum, a reference library, or municipal offices. In spite of that opinion there are members of the Council who maintain that there is no need to demolish the old building; and at the last monthly meeting the following resolution was adopted:—"That the matter be deferred

with the object of securing an opinion from an absolutely disinterested architect free from local circumstances, who should be commissioned to report upon the possible adaptability of the Royal Infirmary buildings for the purposes of a reference library, art gallery and municipal offices." It is not difficult to foresee the kind of report which will be received. An hospital after a few years becomes more or less dangerous to the inmates, and continual attention is necessary to keep it in a safe condition. It can hardly be expected that ordinary civilians will exercise equal care. Even if they succeeded they could not overcome the prejudice which must arise in the minds of ordinary visitors and of those who would use the sections of the transformed Infirmary for the purposes of study.

OVERHEAD bridges for communication between warehouses in narrow streets are not in favour with authorities in the Metropolis, although applications to erect them cannot always be rejected. But once the privilege is granted inhabitants in the street accept the arrangement as one of those things which have to be endured in a city. In Dundee it is otherwise. A firm of photographers, having obtained permission, erected a bridge. Another firm with premises in the street brought an action against the Town Council and the photographers, contending that the Council had only rights over the street so far as was necessary for its use as a highway, or for the purpose of laying under it pipes, drains or sewers; that nothing could be erected above the street without the consent of those owning or having a right of access along the avenue. It is remarkable that the judge adopted the opponent's views. The photographers were held to have no valid right to erect a bridge or gangway, and the Town Council could not delegate the right of determining the kind of bridge to the burgh engineer. In conclusion, his Lordship said Police Acts, written, many of them, under the inspiration of mere love of power, had in them, concealed by their verbosity, many queer provisions, but it might be said broadly that as a rule these queer provisions must be construed in the light of the indisputable general law of the country. They could never be strained to warrant interference with private property, except on some plausible pretext of tax-gathering necessary for the obtaining of money for the general advantage of the community.

RUMOUR used to be represented in the early dramas as having a thousand tongues, but in those days the world was not as populated as now. A myriad tongues would now be necessary to symbolise its power. An example is being afforded at Brecon. Some of the flooring joists in the town hall showed signs of decay. This was interpreted into a report that the building was falling. The President of the Chamber of Trade wrote to the Mayor "to summon a few of the members of the Society to see into the matter or to take outside expert opinion, as it really looked as if it would be little short of criminal to let the work proceed on the lines it was stated it was intended to proceed." The meaning of this is that the Corporation had ordered the repairs to be carried out by the surveyor at once, but for the sake of those who had grown eloquent over the danger it was considered there should be a public investigation, when startling revelations might come out. A meeting was held, but there could be no question about the limited danger. But to satisfy all the following resolution was adopted:—"That this meeting of the Brecon Chamber of Trade is unanimously of opinion that the scheme for repairing the Brecon town hall is quite inadequate, and that the Town Council be asked not to proceed further with the work until they obtain the opinion of a building expert, who shall be asked to report on the scheme generally, and especially with regard to the condition of the walls and timber which it is proposed shall remain and form part of the new building."

### VIOLLET-LE-DUC: A REVIVAL.

THE preparations are in progress in Paris for the Autumn Salon, which may now be considered as an institution like the Summer Salon. One interesting experiment will be made in it, for it will contain a collection of drawings and sketches by VIOLLET-LE-DUC. Will they be attractive? which is a quality most desired by people who attend exhibitions. In all lands architecture is "caviare to the general"; and besides VIOLLET-LE-DUC has been dead since 1879. The fame of many of the painters and sculptors who were his contemporaries has declined, and it would be difficult to discover anything in VIOLLET-LE-DUC beyond his cleverness as an artist by which a new generation of the public could praise him.

There are, on the other hand, grounds for a prejudice against him. He was more versatile than was generally imagined, and his services were in demand for some of the theatrical entertainments given at the Imperial Court. He was also one of the literary and artistic "intimes" who used to gather round the Princess MATHILDE, and he was noted for his irreverence towards everything connected with the churches which he was engaged in restoring. Frenchmen are not always persistent in their opinions, but they occasionally display a desire for the virtue of consistency by abusing men who are not worse than the majority. Whether VIOLLET-LE-DUC sufficiently atoned for his Imperialism by acting as a military engineer in the defence of Paris remains to be seen. He became an out-and-out Republican, to the amazement of those who imagined they knew him; and, incredible as it may appear, he was elected to represent the Faubourg Montmartre in the Municipal Council of Paris. It is to be hoped that after nearly thirty years all the old animosities have been forgotten and admiration will be given to the drawings and designs of VIOLLET-LE-DUC, and that his memory will be considered as worthy of being classed amongst the great men of France, to whom Frenchmen are supposed to be willing to always render homage.

Although he was the son of an official and held official positions during the greater part of his life, it is remarkable that VIOLLET-LE-DUC was not brought up under that official system which is held to be essential for every architect, painter and sculptor who desires to succeed. He was born in 1814, and was the son of an esteemed and scholarly official connected with the Department of Historic Monuments. He became a pupil of ACHILLE LECLÈRE. He does not appear to have spent a week in the Ecole des Beaux-Arts, and that fact may help to explain the refusal of the students to accept him as a professor in 1863. His delightful draughtsmanship must have been early displayed, and from LECLÈRE's atelier he went to study old buildings in the South of France, Italy and elsewhere. To some extent he might therefore claim that he was his own teacher. But although he exemplified the advantages of that method, he also suggested its drawbacks. All through his life VIOLLET-LE-DUC regarded himself as a superior person. As Fate would have it, he was the nephew of old DELECLUZE, who was a pupil of DAVID, but whose paintings were not successful, and who became the lawgiver on art in the *Journal des Débats*. His conversation was ultra-Voltairian, though he allowed he was surpassed in that respect by his nephew. Much of VIOLLET-LE-DUC's education was derived from his uncle, especially as regards all matters relating to philosophy and religion. The nephew was not to be restrained, and went beyond the old revolutionist's doctrines. In course of time the comic spectacle was presented of DELECLUZE as a matter of duty publishing two articles against the dangerous theories of architecture which his nephew announced. Yet he could not forbear impressing on people that he had something to do with the new heresy and to say:—"C'est pourtant là un œuf que j'ai couvé."

In 1840 VIOLLET-LE-DUC was back again in Paris from his travels, and owing no doubt to the influence of

his father, who was one of the first men in France to promote the study of early French writers and whose catalogue of his own library is precious to bibliophiles, was appointed inspector of works under LASSUS. DUBAN at La Sainte-Chapelle—a building with which he was connected during the remainder of his career. The position he obtained was usually reserved for students who had returned from residence in Rome. But France can make exceptions in Paris as in other places. Many other restorations under him followed, and VIOLLET-LE-DUC in 1853 was considered to be so well acquainted with Mediæval architecture and restoration that he was appointed one of the three inspectors-general of churches in France. He was also entrusted with the restoration of the cité of Carcassonne and château of Pierrefonds.

If VIOLLET-LE-DUC's drawings were confined to those required for the official restorations they could hardly be expected to be adequate to constitute a section of a public exhibition. But in 1853 he commenced the publication of his great "Dictionnaire de l'Architecture Française," which took several years to complete, and the next year the "Dictionnaire du Mobilier Français" and "L'Architecture Militaire du Moyen Age." His perspective sketches are marvellous. While they were evidently intended to be diagrams in a technical book, there is no sacrifice of lines to picturesqueness, they have a finesse which was novel in the art of illustration. The lines might have been drawn with a needle, yet they are firm and precise, and the small figures introduced recall stained-glass windows. How a man could work such large works and make so many drawings for himself with his own hand, besides carrying out his other duties, must surprise ordinary men, and is evidence only of wonderful power which had been rigidly disciplined, but of an orderliness in the execution of work which might rival machinery. The pencil, we are told, can speak the tongue of every land, and the countless woodcuts in VIOLLET-LE-DUC's volumes can be appreciated more or less by those who are without much architectural knowledge. But we fear if the original drawings are exhibited in the Grand Palais they will be found to be too delicate to satisfy a crowd.

In 1863 he was appointed Professor of the History of Art and Esthetics in the Ecole des Beaux-Arts. It required courage to select him. A man who did so definitely could not fail to possess decided views, and it was easy to anticipate that he would be in favour of a return to Mediæval ways. He belonged to the Romantic School, who considered independence essential for an artist, and architecture of the Gothic type offered far greater scope for liberty than was to be found in an adherence to the Classic orders. The existence of the Académie des Beaux-Arts was in itself a fetter on originality, and we may therefore be surprised that the potentates who belonged to it did not altogether disapprove of the rebellion of the students. About VIOLLET-LE-DUC's excellence as a draughtsman, although his work was always on a small scale and mainly architectural, there could be no doubt. It was as an expert he condemned the academic system, which made drawings from lithographs or other prints compulsory. He made no secret of his opposition to the whole established process, which appeared to be intended for the creation of embryo academicians.

He had decided opinions about successful art. He looked on it as the slave of fashion, and considered a term of about twenty years was the duration of a reputation. It is to be hoped that law will not apply to his own works. Architecture he considered too should be an expression of the age in which it was produced. He denied that it was possible in the nineteenth century for people to express themselves either in the style of the Greeks or of the Frenchmen of the Middle Ages. With such a belief he could not be happy in the production of his own designs. WILLIAM BURGESS publicly declared VIOLLET-LE-DUC was not an architect—that he was simply an archæologist, and

remains to be seen whether any of his original designs find favour with Parisians. They have to suffer from one evil. It was known he was not a believer, and he may therefore be looked upon as the representative of a state of things which was brought forward as one of the reasons for the separation of the State from the Church. Some of the views may also invite pity. For if churches and cathedrals are to be converted into municipal institutions for secular purposes or left as mere relics of antiquity, where was the use of so much labour and expense in restoring them? It is possible that the drawings made by VIOLLET-LE-DUC as an amateur military engineer during the siege of Paris will arouse greater interest than his æsthetic drawings. It would appear as if a new era was opened to him with the Republic. He entered with earnestness into plans for the improvement of the city. And as at one time he wished to have every house with a statue in it, or, as he said, a parakeet in each cage, so he was eager to multiply the statues of Paris. It was at his suggestion that the Exposition of 1878 was divided between the Trocadéro and the Champ de Mars. The latter is now again about to be cleared, and the halls of the Trocadéro are desolate. His sudden death at his country residence near Lausanne put an end to his amazing activity. Modern Frenchmen should recognise the peculiarity between VIOLLET-LE-DUC and themselves. In the laws of heredity were exemplified. His father preferred the poetry which appeared in France prior to the sixteenth century to all later works. The son, being more of a man of science, preferred the ancient writings. On his mother's side he inherited the irrepressible spirit which preceded the first Revolution. He did not fail to imbibe from the men around him the doctrine that an artist should follow art for the sake of art, and should be glad to display his power in a statue or in a cathedral. These diverse influences explain the peculiarity not only of his work but of his life.

### ARCHITECTURAL CATEGORIES.

THE effort of man to systematise things was displayed so early, we may suppose a tendency of this kind was inherent in him. Without it there could be no civilisation. "Order is Heaven's first law," and this maxim remains true although at one time order was held to be less desirable than disorder. We cannot imagine an age, however distant, when strength and order did not prevail. Divisions of the people into classes, trades, citizens, helots, patricians and plebeians were simply based upon some theory of categories. Hence, therefore, ARISTOTLE announced his series of categories, viz. substance, quantity, quality, relation, time, position, possession, action and suffering, it is not likely he was only making another attempt to put everything in its proper place. Some of the divisions were recognised before his time. It is also remarkable that a nearly similar series is found in Indian logic; but whether it was derived from the Greeks, or ARISTOTLE was indebted to the Indians cannot be ascertained. His categories had a powerful influence on the progress of philosophy during the Middle Ages. The Church set greater value on the Stagyrice than on his master PLATO; and it cannot be denied that the old divisions are more valuable than those formulated at a later time. The Church placed no value on them, and STUART MILL proposed to supersede them by four:—(1) Feelings or consciousness; (2) the minds which experience these feelings; (3) the bodies or external objects which excite certain of these feelings, together with the power or properties whereby they excite them; (4) the successions and co-existences, the likenesses

and unlikenesses between feelings or states of consciousness.

The desire to discover some common denominator which will simplify the astounding variety of the world is always likely to continue. COMTE's three eras of the world's progress can be considered as categories. The attempts of RICKMAN, SHARPE and the Cambridge Camden Society to subject Gothic architecture to one or other of their systems are also evidence of a like tendency. Such comprehensive titles are becoming obsolete. At one time there was supposed to be one kind of Greek architecture; now we have indications enough of several varieties. Renaissance has been an affair of cities and schools, if not of individuals. Sciences like medicine and law have had to submit to division into strange provinces. Even theology, although it is not supposed to be progressive, is undergoing a process of reclassification of which no man can see the end.

Dictionaries, which might be supposed to be the first of all classes of works where new theories could be tried, resist innovations in a marvellous way. For ordinary people the alphabetic arrangement is the best adapted for consultation when time has to be considered. But various attempts have been made to display the relationship of words in a more evident way than is possible by that arrangement. One of the most familiar is ROGET's "Thesaurus," which begins with words expressing abstract relations. He was compelled to adopt over a thousand categories instead of ARISTOTLE's ten in order to make the book useful for reference, and his lists had to be supplemented by alphabetical indexes. COLERIDGE also, when he was consulted about the "Encyclopædia Metropolitana," proposed to base it on the principles of method, and the master thought of his plan was, he said, the moral origin and tendency of true science. But he could not avoid a supplementary alphabetical dictionary.

Although we suppose so-called philosophers who deal mainly with words could not dispense with an elaborated system of categories, the human mind in later times (as well as in prehistoric), instinctively turns to a system based on a recognition of relations, although it may not be so subtle as ARISTOTLE's. When a poor woman arranges to have everything in its place and a time for all things, what she does is based on a categoric basis. If a professor of Greek or Mediæval philosophy would condescend to visit the premises of a builder's ironmonger on a large scale, he could not fail to be amazed. The messengers and porters who come for goods are always in a hurry, and take care to demonstrate they are not disposed to act as lookers on. The varieties of goods could be described not by hundreds, but by thousands, and yet there is no delay. Categories may be called arranging nameable things in pigeon-holes. The ironmonger is always increasing his stock as new inventions are brought out. But there is no clue apparent to the system by which a grimy assistant at once places his hand on the object required. Infinitely more philosophic than the shop system is a bill of quantities by a London surveyor for a large building. It is based on a system by which omissions are generally detected, and items of the different kinds of work appear in their proper places with as much precision as if the treatises on rival methods of categories were familiar to every assistant.

We have been led to offer these remarks from seeing one of the Bulletins of the University of Illinois, entitled "An Extension of the Dewey Decimal System of Classification applied to Architecture and Building," by Mr. N. CLIFFORD RICKER, D.Arch., Professor of Architecture. Dr. DEWEY is one of the men who believe in the intellectual revolution which will arise from the spreading of public libraries among his countrymen. Believing that much depended on the skill of the librarian, he set up a school for training them, and he devised a system of classification which is not only comprehensive, but is adapted to the needs of men of

business. All books, according to him, may be classified into ten classes or centuries, viz. :—

0 to 100	General works
100 to 200	Philosophy
200 to 300	Religion
300 to 400	Sociology
400 to 500	Philology
500 to 600	Natural science
600 to 700	Useful arts
700 to 800	Fine arts
800 to 900	Literature
900 to 1,000	History

It would be easy for Professor RICKER to have started with 0, but as the DEWEY system is becoming national he adopts it. Thus fine arts start with 700 and architecture with 720. In that way the system is continued between 720 and 730, the latter being the starting number for sculpture. We believe it is the custom in preparing the various bulletins of the University to allow the students to co-operate, and the preparation of the lists for architecture would allow a great many to take part in the work to their own advantage. In all cases books come first. For example, in building materials there are theories of constructions, compends, dictionaries, essays, periodicals, societies' proceedings (including trades unions), educational study, museum, history of building materials, processes, materials and preservations. Then follow woods, stones, bricks, lime and cement, plaster, glass, iron and steel and other metals, plans, specifications, estimates, building laws, construction of various kinds, carpentry, plumbing, lighting, ventilation, &c.

After materials and construction, fine arts begin, as exemplified in the history of various countries. Landscape architecture takes precedence of ordinary architecture, and lists are made out of different items which may be made the subject of books, papers or discussions. Altogether the lists fill over seventy pages, with over 2,000 items, and to facilitate use there are twenty pages with the items in alphabetical order. In the latter the reference is not to the page where the subject is found, but to the decimal number. In that way we have the recognition of relations however wide apart.

The Bulletin can be made use of by students in order to discover what they know and what remains to be studied. Thus, where elevations have to be considered—composition, subdivision, proportions, light and shade, perspective effect, balance, axial lines, accenting; the section—longitudinal, transverse, diagonal, broken, oblique and the plan—composition, distribution, proportions, sequence of rooms, communications horizontal, communications vertical, axial lines, balance, must also be taken into account.

A quantity surveyor or a busy architect, if he condescended to glance over the pages, might say that they were merely child's play, hardly worthy of his consideration. It is not a difficult task to take a great many terms in a glossary and to arrange them in a new order. In the Bulletin something more is done. By accepting the DEWEY classification architecture falls in its right place among subjects of a very different class. That is to say, as indicated in the general list, it is one of the fine arts that come between the useful arts and the world of books. What is more important, features that are common to all styles are distinguished from those peculiar to one. We should not be surprised if we were informed that those who took part in the arrangement of the list had acquired very clear notions about unity in architecture, and were also able to realise where innovations were most likely to succeed.

What is most remarkable perhaps in a logical sense is the difference between the architectural categories and those which the Greeks accepted as comprehending the universe. A wall, a ceiling, a floor are from their simplicity almost outside the region of dialectics, like much else in building. But no ARISTOTLE or MILL could make any simpler division of them which would have any practical use.

## ARCHITECTURAL REFINEMENT: RHEIMS CATHEDRAL.

By WILLIAM H. GOODYEAR.

ON Monday, July 1, I arrived at Rheims and called on M. Léon Margotin, inspecteur des travaux for the cathedral, in order to present my credentials with a view obtaining a permit for photography. During the interview I mentioned to M. Margotin my wish to obtain from him official certification for the existence of an intentional constructed outward vertical divergence in the lines of the cathedral nave (the widening refinement).

M. Margotin replied that he did not understand me, and took down from his library shelves the folio publication, *L'Alphonse Gosset*, on the cathedral of Rheims, dated 1898. He turned to the plate giving a transverse section of the cathedral, and requested me to point out in it the feature which I had described.

I then explained to M. Margotin that this transverse section did not represent the real facts, and that the cathedral was not constructed with perpendicular lines, as represented in this survey; that the piers were perpendicular only to the height of the capitals, but that, directly above the capitals, the vaulting shafts and all surfaces were inclined outward, in straight lines, up to the nave vaulting. M. Margotin declared himself to be unaware of the existence of such a vertical divergence. I thereupon suggested a mutual examination of the cathedral, and an appointment was made for this purpose for nine o'clock on Tuesday morning, July 2.

On our way from M. Margotin's office the next morning he stopped at the Chantier, and requested M. J. Martin (chef du Chantier, contremaître de travaux à la cathédrale de Reims) to accompany us. M. Martin was also unaware of the existence of a vertical divergence in the nave.

No sooner had these gentlemen entered the nave with me than they verified with great interest the divergence of the vertical lines. I pointed out to them that the piers of the nave (and choir) are exactly perpendicular up to the capitals (which can be verified by the numerous plumb lines which are furnished by the wires of the chandeliers which hang from the vaulting), and that the outward divergence in straight lines could not therefore be attributed to thrust from the aisle vaulting, as in that case the piers would lean into the nave. As regards the thrust of the lofty nave vaulting, I pointed out to them that the divergence begins at the springing of the aisle vaulting against their thrust and weight, and that the divergence includes all the masonry surfaces, as well as the vaulting shafts. Consequently, thrust from the nave vaulting could not operate below the triforium, so as to carry outward the weight and thrust of the aisles, in lines and surfaces which are straight (although inclined outward) for the entire remaining height of the church.

As a matter of fact, this much argument was hardly necessary. I pointed upward to the enormous masses of the aisle vaultings and a nod of assent was the reply.

The official certificate which follows this letter was subsequently furnished by M. Margotin for publication, and during three weeks' stay in Rheims I enjoyed many opportunities for conference with him and with the chef du Chantier. With the latter, on a subsequent occasion, I examined the transepts, and was pleased to have him verify, in the transepts, the same construction which I found in the nave, and with a system intersecting the system of the nave.

I also accompanied both gentlemen on separate occasions to the Gothic church of St. Jacques, where I was able to show them similar facts, which they found equally remarkable and which were also previously unknown to them, including vertical curves which they both on these separate occasions verified as constructive.

At least two-thirds, and perhaps a larger proportion, of the Mediæval cathedrals and Mediæval churches of Northern France exhibit a construction similar to that which is attested by M. Margotin's certificate for the cathedral of Rheims. I do not know of a single instance in which the divergence does not begin below and against the thrust and weight of the aisle vaultings throughout the nave; excepting in Notre-Dame at Paris, and here this evidence of constructive intention is found in the eastern crossing piers.

I estimate the maximum divergence at Rheims to be not less than 10 inches (25 cm.) at the centre of the nave on each side, making a total maximum divergence of not less than 20 inches (50 cm.). In the crossing piers the divergence is hardly perceptible, and in the tower piers at the entrance the divergence is very slight, although distinctly perceptible.

by plumb-line test. The inclination of the vaulting shafts increases from these piers towards the centre of the nave (and they also return to the full amount of inclination in the choir).

The gradual increase of inclination toward the centre or the nave is reflected in the existence of curves in plan, convex to the exterior, on both sides, in the upper nave, beginning near the triforium. At the clerestory parapet these curves have a deflection of  $9\frac{1}{4}$  inches on the north side and of  $11\frac{1}{4}$  inches on the south side. At the roof parapet the curves measure 10 inches deflection on the north side and  $11\frac{1}{4}$  inches deflection on the south side.

These curves are manifestly connected with the increase of outward vertical inclination toward the centre of the nave, and indicate a total divergence of 20 inches at the clerestory parapets, thus verifying the estimates based on photographic surveys in the nave with surveyor's disk on the plane of the measurement. The alignment of the piers of the nave, from base to capital, and of the outer walls of the church, is rectilinear, although the usual bend in plan occurs in the choir. (It bends in plan to the right.)

M. Margotin and M. Martin are well acquainted with the existence and intentional construction of these curves in plan, convex to the exterior, although they had naturally not related them before my visit to the vertical inclinations of the nave.

The responds, or engaged pillars, of the aisles have an outward inclination like that of the nave. They incline delicately outward in straight lines at the fourth course of masonry, about 9 feet above the base. The effect is that of delicate entasis, and the positive existence of these delicate inclinations can only be ascertained by plumbing. The eye remains in doubt without this assistance. The facts are uniform for all responds in both aisles, with the exception that the first respond adjacent to the transept on the north side, and the two responds adjacent to the transept on the south side, are perpendicular.

This arrangement certainly relates to the fact that these responds are the ones adjacent to the perpendicular piers of the transepts. If these responds were inclined, the fact would be apparent by sighting on the perpendicular transept piers, and the delicacy of the arrangement would lose by this conspicuity.

The plumb tests on these responds were made in the presence of M. Margotin and M. Martin, and were verified by them and excited their great interest. These plumb tests have been photographed for most of the responds. The outward inclinations average about  $2\frac{1}{2}$  inches in a height of 30 feet 8 inches.

I subjoin another certificate for related facts in the church of St. Loup, at Châlons (Marne), where the divergence is in straight lines and against aisle-thrust, from the pavement up. The inclinations are about 4 inches to a side at the apse, in a height of about 24 feet.

This church had windows at the choir end of the aisles, with sides and mullions inclined obliquely, so as to align with the immediately adjacent inclined piers at the angle of the terminal wall of the aisles and the apse. I photographed the window of the right aisle in 1903 (published in 1904). At that date the curé told me that he intended to have the window rebuilt, because it did not harmonise with the lines of the modern altar which he had caused to be built under it (this fact was also published). The curé died in 1905, and as a tribute to his memory the window has been rebuilt at an expense of 500 francs, and the mullions are now perpendicular.\* The obliquity of this window on the side adjoining the pier at the apse angle has been plastered to the perpendicular, but the window is still oblique on the exterior side, where rectification could not be carried out without tearing down the wall. I now have a photograph of the window in its present condition to contrast with the one made in 1903.

The similar oblique window in the terminal wall of the opposite left aisle still has the oblique mullions.

In addition to the certificates furnished by MM. Margotin and Aubertin for the existence of the widening refinement in French Mediæval architecture, I am authorised by M. Auguste Choisy to publish certain quotations from a letter which he has recently addressed to me. M. Choisy has been familiar for some years with the progress of my observations regarding the widening refinement (as announced in Italy in my "Architectural Refinements of St. Mark's at

Venice," and as announced for France in "Vertical Curves and other Architectural Refinements in the Gothic Cathedrals of Northern France and in early Byzantine Churches at Constantinople" \*). He personally expressed to me four years ago the opinion which he has now given in writing, and which I am authorised to quote in publication.

#### M. AUGUSTE CHOISY'S OPINION.

The question of the interior inclinations of the piers appears to me to be studied with a conscientiousness and with methods of observation which place the fact beyond doubt. . . . The astonishment of the architects of the cathedral of Rheims shows what a novel field of investigation you have opened up. Whatever theory one may adopt, here are facts which must be reckoned with, and which no one before you had thought of analysing.

#### CERTIFICATE OF M. LÉON MARGOTIN.

Rheims: July 3, 1907.

Sir,—I am pleased to have been able to verify, and with great interest, certain distortions (*déformations*) in our cathedral. In fact, and as you have been kind enough to point out, I have been able to observe that at Rheims the piers of the nave have preserved their perpendicular, but that, above the capitals, they diverge gradually toward the exterior up to the springing of the vault. These distortions, also observed by you in other buildings of our territory, appear to me intended by the architects who were charged with the construction of these monuments, and to have been arrangements of construction. They cannot be attributed to a lack of resistance in the powerful flying buttresses at Rheims, especially since these same distortions are verified in all the piers and even near the transepts, where the masonry constructions make any thrust from the vaults impossible.

In my opinion, we must recognise certain effects of grandeur as having been purposed, which are wholly to the advantage of the edifice.

Please accept, Sir, the expression of my cordial regard,

L. MARGOTIN,

*Architecte diplômé du Gouvernement,  
Inspecteur des travaux à la Cathédrale de Reims.*

#### CERTIFICATE OF M. A. AUBERTIN.

I, the undersigned, Albert Aubertin, architect at Châlons-sur-Marne, author of the spire and other works of repair on the church of St. Loup, consider that the very visible inclinations of the four great piers at the transepts, and of the pillars of the aisle chapels, are not the result of thrust, but that their condition dates from the construction of the church.

Here is an effect designed by the builder, and the arches thus display a sort of horseshoe form, destined to correct, or rather to modify, the effects of perspective.

The inclinations begin at the bases of the piers; there are no defects in the adjacent masonry, either in the walls or in the vaulting ribs or vaultings.

Given at Châlons, June 27, 1907.

A. AUBERTIN.

#### CLASSIC CAPITALS.

CAPITALS to columns are of early invention, and are as useful as they are ornamental. They embellish the upper part of the column, and prevent its angles from being fractured or from damaging the architrave. In the earliest times columns were used without capitals, and a short time afterwards with only an abacus, as in some Egyptian specimens, particularly in the ruins of Thebes. This afterwards was improved to a sort of bell-formed capital, at first plain and afterwards sculptured with hieroglyphic figures, foliage, &c. The fruit or flowers of the lotus probably gave rise to the bell-formed capital, which was afterwards embellished with palm leaves, as in some examples found at Esné. In some temples at Amara and in the island of Philæ the capitals are formed of the head of Isis.

The capitals used in Persian architecture are of three kinds, one of which is nearly half the height of the shaft of the column and resembles a plume of feathers which falls down all round, in the middle of which rises another plume, and from thence an unknown ornament. The others are composed of the anterior moieties of the fabulous unicorn, in the manner of the heads of Janus of the Romans. Capitals of this kind are found in the royal tombs of Persepolis, near the palace.

\* This work was not done by M. Aubertin, whose earlier employment on the repairs of St. Loup is mentioned in his certificate.

\* *Memoirs of Art and Archæology of the Museum of the Brooklyn Institute*, Nos. 2 and 4.

The capitals of the temple or pagoda in the island of Elephanta are like broad and flat cushions, somewhat compressed, consisting of a double echinus, one turned to the other and separated by a fillet.

In the architecture of the Greeks and Romans, the following are the usual divisions of the capitals. According to Vitruvius, the height of the Tuscan capital from the astragal at the bottom must be half the diameter of the body of the column below. And the height being divided into three parts, the first and uppermost part goes to the abacus, the second part goes to the echinus and fillet under it, and this part is subdivided into four parts, of which three go to the echinus and one to the fillet; the third and last part is divided into two parts, one of which is the breadth of the astragal under it, which consists of a semicircle and a fillet under it. The astragal again is divided into three parts, of which two are given to the semicircle and one to the fillet. The projecture of the capital to be one-eighth part of the diameter of the body of the column below. The astragal projected from a square. According to Scammozzi, the height of the capital from the astragal at the bottom must also be one-half the diameter of the column below. And this height being divided into sixty parts, twenty of them are to go to the abacus or plinth, as he calls it, fifteen to the echinus, which Vitruvius calls the boulder, five to the roundel or bead moulding, which is a semicircle, three to the listella, which Vitruvius names a fillet, and seventeen to the neck or frieze. Again, seven such parts must go to the ovolo of the astragal and three to its listella. According to Palladio, the height of the capital is half the diameter of the body of the column below, viz. at the astragal, which none of them reckon a part of the capital, though in propriety it ought to be so esteemed; and this height is divided into three equal parts, the uppermost of which goes to the abacus, which he calls the dado or dye; the next part goes to the ovolo or echinus; the rest is divided into seven, of which one is for the listella under the ovolo, and the other six parts go to the collarino or neck; he also called it the hypotrachelium or frieze of the capital.

The height of the Doric capital from the astragal at the bottom is said by Vitruvius to be equal to half the diameter of the body of the column below. And this height being divided into three parts, the first and lowermost goes to the neck, the next part goes to the echinus, by which term he here comprehends several members. He describes this part in two forms, one of which is an echinus and three fillets under it; the other an ovolo and an astragal under it, and this portion was divided into three parts, two of which go to the echinus and the other to the three fillets or to the astragal, and the fillets are all of an equal size. In the astragal the fillet is one-third of the whole; the third and uppermost part of the capital is again divided into three, the two lowermost of which go to the square and the other to the cimatum, which is an ogee with the hollow downwards and a fillet over it. An ogee or cima recta is a moulding somewhat resembling an S, which Vitruvius makes of two quarter circles joined together, and this cimatum being also divided into three parts, two of them go to the ogee and one to the fillet; the astragal under the capital is equal to half the neck.

Scammozzi makes the capital of the same height, which he divides into sixty parts, of which three go to the fillet of the cimatum, five to the ogee of the cimatum, twelve to the square, fourteen to the boulder, five to the rondel, two to the fillet of the astragal under the boulder and nineteen to the neck. The astragal contains ten such parts, of which six and a half go to the rondel and three and a half to the fillet.

Palladio also makes the capital of the same height with Vitruvius, which he divides into three parts, the uppermost of which he subdivides into five parts, two of which go to the cimatum, and is again subdivided into three parts, one of which goes to the listella or annulet and the other two to the cima recta. The other three of the first subdivisions of this part go to the abacus; the second of the three grand divisions of the capital is subdivided into three parts, two of which go to the ovolo or echinus and the other to the annulets under it, which are three and are equal; the third principal part goes to the hypotrachelium or frieze. The astragal under the neck is as high as all the annulets.

In every Grecian Doric order the abacus of the capital is always plain, being a solid parallelepipedon, of which its two horizontal sides are equal squares and its vertical or perpendicular sides are equal rectangles; the inward recesses of the annulets in the capital are in the same curve

line as the ovolo above them (the Doric portico at Athens excepted), and their outward extremities are equal to their inward recesses.

The Ionic capital is formed thus by the Vitruvian rule. Divide the semi-diameter of the body of the column below into eighteen parts; take nineteen parts, of which three must go for the cimatum, one to the fillet and two to the cima or ogee under it. Then take four parts for the trochilus of the volute or scroll (the trochilus is the member from whence the scroll begins); then take four parts for the boulder, which is one-fourth of a circle, and is to be carved with eggs and anchors. Then take two parts for the astragal under the boulder. The astragal is carved with beads, and has a fillet on each side of it, each one-fourth of the whole. The six remaining parts must go to the half of the volute below; then take eight more such parts, which must go to make the remainder of the frieze or neck of the capital, and three more such parts for the astragal, under the neck on which one part goes to the fillet.

According to Vitruvius, the height of the Corinthian capital from the astragal at the bottom is equal to the diameter of the body of the column below, one-seventh part of which goes to the abacus, which consists of an ovolo, a fillet and a cavetto. The abacus being subdivided into three parts, one of them goes to the ovolo, and a third part of the next goes to the fillet and the rest to the cavetto. The height of the astragal below the capital is one-twelfth part of the diameter of the body of the column below, and is divided into three parts, whereof the fillet contains one part and the boulder two. Scammozzi makes this capital one diameter and one-sixth of the column high, which divided into seventy-five parts, four of them go to the boulder, one to the fillet, nine to the plinth and the rest to the neck. Palladio also makes the height of the capital equal to the whole diameter of the body of the column below and one-sixth part more, which is allowed for the abacus, by which probably he meant all the mouldings above the acanthus leaves.

Vitruvius divides the Roman or Composite capital like the Corinthian, and so does Scammozzi and Palladio, only the carving of it is somewhat different.

#### SHIRE HALL, WORCESTER.

CONSIDERABLE progress has been made with the scheme for the heraldic decoration of the eight windows in the large hall of the Shire Hall at Worcester, and in the course of the next few months the work which has been entered upon by the County Council after minute attention to designs and cost, will in all probability reach such a stage as will afford much gratification to Sir H. Vernon, Bart., Mr. W. Pearce and the members of the sub-committee who have studied the records of the county since the erection of the hall in 1837. Quite recently, says the *Birmingham Daily Post*, the co-operation of the city of Worcester and the five boroughs in the county was invited in order to make complete the decoration of the centre light of the north window. Bewdley, Evesham and Kidderminster have signified their willingness to join in the project, and at a cost of 14*l.* emblazon the arms of their respective boroughs. The Worcester City Council have referred the matter to their general purposes committee, by whom it will probably be considered next week, and replies are expected from the two other boroughs, Droitwich and Dudley.

The coats-of-arms of the boroughs, although interesting, will form but a small part of the general scheme, which it is calculated will cost the county about 200*l.* It is intended by the Council that the other windows in the hall shall be filled with stained glass, representing the arms of the Lords-Lieutenant, the High Sheriffs and the chairmen of Quarter Sessions and of the County Council who have filled those offices since 1837. The cost of emblazoning the arms is borne by the noblemen and gentlemen interested, the County Council bearing the expense of fixing, protecting and insuring the windows. The work on the south window is practically complete, and is a source of considerable interest to visitors. In the centre light the arms of the four Lords-Lieutenant have been fixed—viz. Thomas Henry Baron Foley, George W. Baron Lyttleton, Frederick Earl Beauchamp and George William Earl of Coventry—while in the two side windows the arms of the High Sheriffs from 1837 to 1884 have been fixed as far as practicable. The borders and geometrical glazing for panes which are not to be filled

with arms are also executed. Two of the High Sheriffs, namely, for the years 1867 and 1876, appear to have borne no arms, and it is proposed to place the crest and motto borne by these gentlemen, with their names, in lieu of arms in the panes reserved for those years. The consent of their representatives has been obtained and the cost promised.

The arms of the Sheriff for the year 1866 have not been supplied, and one other High Sheriff has not yet consented to provide arms. The sub-committee hope, however, that they may be forthcoming on a further appeal. The panes for which no arms or crests have been supplied will be dealt with in accordance with a resolution of the standing joint committee, at the cost of the County Council of 3*l.* per pane. It has not been possible to trace the present representative of Mr. John Richards, High Sheriff in 1844, and these arms will have to be provided at the cost of the Council. So far as the two side-lights in the northern window are concerned, one will be devoted to the arms of the High Sheriffs from 1885 to 1906—there are thirty-two panes in each window—and the remaining side-light will be reserved for future purposes. All the High Sheriffs' arms to be placed in the northern window have been obtained, with the exception of those of the Sheriff for 1891. The pane allotted to this year will be treated in the same manner as that for the year 1866 in the south window. The arms of one other Sheriff in this window may not be forthcoming, but he has furnished his crest, and is willing to pay for the treatment of the pane in whatever way the committee may decide. To sum up, out of the sixty-nine emblazonments required for the panes in the High Sheriffs' windows from 1837 to 1906, all but four have already been obtained, and one of these will probably be forthcoming.

The south-west window has been reserved for the arms of the chairmen of Quarter Sessions and the north-west window for those of the chairmen of the County Council. Up to the present time the Council has been presided over by only two chairmen—Mr. G. W. Hastings from 1889-92 and Mr. J. W. Willis Bund from 1892. With regard to the south-west window, it has been found that unless the Council go back further than 1837 they would have only five coats of arms for decorative purposes, and it has been proposed to go back as far as 1800, and thus obtain eight more coats, viz. William Welch, 1795-1817; William Earl Beauchamp, 1817-23; Benjamin Johnson, 1823; Earl of Mountnorris, 1823; Thomas H. Bund, 1823; Other Archer Earl of Plymouth, 1824-8; Sir Christopher S. Smith, 1828-33; Thomas Beale Cooper, 1833-6.

### GLOUCESTER CATHEDRAL.

A REPORT prepared by Mr. F. W. Waller for the Dean and Chapter of Gloucester Cathedral in February 1906 pointed out that the following reparative work was then most urgently needed:—West pinnacles of the nave; south-west turret of the south transept and clerestory windows of the nave, north side; great central tower, including roof and first bay of the choir adjoining the tower; roofs of the nave and south aisle; roofs of the north transept, north aisle and south cloister; exterior stonework of the south and north aisles and of the west end of the nave. Mr. Waller also directed special attention to the lighting of the cathedral, and stated that as so many services and recitals were held in the nave, this had become a very important question; the present system, by means of gas jets, causing injury to the stonework apart from the discolouring.

Since Mr. Waller's report, repairs have been fully completed in connection with the pinnacles at the west end of the nave, the west window, the south-west turret and the interior of the south transept, and also the stonework in the west walk of the cloisters. The most urgent and important repairs in connection with the choir vaulting adjoining the south-east angle of the tower itself at that point have almost been completed. This latter has proved to be a very difficult and extensive work, and one needing exceptional care to bring to a satisfactory conclusion, as serious settlements had taken place in the facework of the tower and in the groining above, resulting in the fall of part of the stonework, to which attention has been previously called. A very careful examination will now be made of other parts of the stonework and groining of the choir, including that beneath the tower, as further repairs are undoubtedly needed.

Scaffolds have been erected on the east and south sides of the great central tower, and a closer inspection shows the urgency of the work. The erection of such scaffolds requires exceptional care, the upper stages of the tower

being of slight construction and entailing a large expenditure both in material and labour. It is hoped to complete the repair of the upper portion of the east and south sides of the tower before the winter, so as to enable the higher portion of the scaffolds to be taken down. The north and west sides of the tower are in the same condition, and similar scaffolds will have to be erected to enable the repair to such two sides to be carried out.

With regard to the question of lighting in the nave, Mr. George Embrey, the county analyst, has been consulted and has made an analysis of scrapings of stone taken from the small pillars in the nave triforium over the existing gas-jets, and the analysis shows that decomposition of the surface of the stone must result, and in fact has already commenced, and that consequently the use of coal gas in such a building as the cathedral should be condemned. The Gloucester Corporation have laid an electric cable into the cathedral free of charge, and the Dean and Chapter are anxious as soon as the necessary funds are available to carry out the work of lighting the cathedral by electricity, or at least the lighting of the nave, which Mr. Embrey's report shows is a very urgent matter.

A report has also been made by Mr. Waller on the condition of St. Mary's Gateway, which, on examination, has been found to be in an almost ruinous condition. The necessary steps have been taken to protect and support this most interesting building, but the cost of keeping it in position and of carrying out such repairs as are necessary for its future protection will be considerable.

A list of contributions paid and promised to the restoration fund to date is appended, amounting to 6,658*l.* 2*s.* 7*d.*, and the Dean and Chapter wish to express their most grateful thanks to the many generous donors, and especially to the Provincial Grand Lodge of Freemasons of Gloucestershire for their munificent donation, which is to be applied in payment of the cost of repairing the pinnacles, &c., at the west end of the nave. A large sum, which may be estimated at 5,000*l.*, in addition to that already subscribed, will be required to enable the Dean and Chapter during the next three or four years to carry out the whole of the urgent repair work, including the electric lighting, and they therefore have to earnestly appeal for further donations during such period.

The expenditure up to the end of July 1907 is as follows:—Two large pinnacles at west end of nave, 745*l.* 19*s.* 8*d.*; small pinnacles and other work at west end, 55*l.* 8*s.* 3*d.*; south-west turret of south transept, 283*l.* 18*s.* 10*d.*; lightning conductors to pinnacles and turret, 60*l.* 9*s.* 4*d.*; choir vaulting and south transept (to date), 305*l.* 11*s.* 3*d.*; west walk of cloisters, 170*l.* 1*s.* 2*d.*; great central tower (to date), 360*l.* 0*s.* 8*d.*

### SOCIETY OF ARCHITECTS.

THE following are the nominations for officers and Council, 1907-8:—Professor H. Adams, R. G. Bare, J. Bartlett, Geo. E. Bond, F. W. Chancellor, F.R.I.B.A., J. B. Corby, F.S.I., T. W. Cotman, J. W. Dyson, H. V. Milnes Emerson, H. E. Hawker, F.S.I., Cholton James, F.R.I.B.A., W. J. Jennings, J.P., F.S.I., Col. F. S. Leslie, R.E., Ellis Marsland, H. W. Matthews, C. H. Mead, T. R. Richards, E. J. Sadgrove, F.R.I.B.A., Anthony Scott, W. A. Scott-Deakin, F.R.I.B.A., T. F. Tickner, F.R.I.B.A., Percy B. Tubbs, F.R.I.B.A., B. R. Tucker and R. F. Vallance, F.R.I.B.A.

It is proposed to organise a visit to Letchworth on Saturday, September 21, for the purpose of seeing the Garden City and the Urban and Small Holdings Exhibition now being held there. The visit will be open to members and students of the Society and their friends, and ladies are invited.

The price of tickets will be approximately as follows:—(a) For a half-day visit, starting at 1.45 p.m., including return fare from King's Cross, tea and exhibition, four shillings. (b) For a day visit, starting at 11.10 a.m., including return fare from King's Cross, lunch, drive round the estate, tea and exhibition, seven shillings. Those who propose taking part in the visit are asked to communicate with the secretary at once, indicating which time they prefer, (a) or (b), and stating approximately the number of their party. The visit can only be organised if a sufficient number send in their names before Monday, September 16.

Roman Relics consisting of over 100 pieces of pottery, apparently portions of burial urns, have been discovered during excavations on the site of Wareham (Dorset) Castle.

## NOTES AND COMMENTS.

It may be remembered that two or three years ago an effort was made by Mr. LANE to obtain examples of pictures by modern artists for a public gallery in Dublin. The Irish National Gallery is occupied with older works from which students cannot derive much profit. Mr. LANE's efforts were rewarded by several gifts and promises of others. But there was no gallery available for modern art. The term had nearly expired in which the pictures should be received. The public libraries committee therefore some months ago secured a lease of premises in Harcourt Street, at a rent of 100*l.*, for fifteen years, but with a right to surrender at the end of five years or any subsequent year. The question remained, from where was the rent and the money for the upkeep of the gallery to be obtained. At least 500*l.* a year will be required. The penny in the pound is barely sufficient to support the libraries. The only way out of the difficulty seems to be to derive the money from the borough fund. It has to be seen whether the Local Government Board will sanction the arrangement.

A REPORT has been presented to the French Fine Arts Department by the Chef de la Sureté, with the approval of the Prefect of Police, concerning the measures necessary for the protection from vandalism of works in the galleries of the Louvre. First is the formation of a brigade of thirty agents, the next is the erection of a barrier along the walls in front of the paintings. Any artists who work in the Louvre and who are possessed of a card of admission can be allowed to enter within the enclosure on making application to the officer in charge. It is considered to be wise if the small rooms, which are connected by a long corridor, were closed, as it is difficult to give them the close attention which is desirable. If they must be retained then it would be well to have detectives in the corridors in order that the slightest attempt to injure a work shall be at once prevented. It is recommended that the rule "Défense de toucher" should be strictly enforced and that the slightest infraction should be followed by punishment. Lastly, it is advised that the number of special guards should be increased. A great many lovers of the Louvre are of opinion that the throwing open of the galleries to unfortunate people who come there for the sake of warmth in winter or as a resting-place in summer should not be unrestricted. With all its wealth Great Britain charges for admission to picture galleries on certain days in each week. In other countries there is a similar rule, and it is quixotic on the part of France to be unique in dealing with so important a matter.

THE construction of reservoirs in connection with waterworks offers many risks which cannot all be foreseen. It is not certain that some of those lately carried out in this country will answer all the expectations of the engineers and local authorities. The same difficulties are found in the United States. Last month the Board of Water Supply of New York awarded the contract for the Ashokan dam in the Catskills to MACARTHUR BROS. Co. and WINSTON & Co. for 12,669,775 dols. This was not the lowest bid, as the John Peirce Company submitted a tender of 10,315,350 dols. In announcing the award Commissioner CHADWICK made the following formal statement:—"The question regards the construction of a dam which shall hold water, which involves a special form of construction, requiring expert knowledge and experience, and the details of which must be rigidly insisted upon. The cost of the work, as separately and independently estimated by the chief engineer, two designing engineers and an assistant engineer, is shown to be over 2,000,000 dols. more than the bid of the lowest bidder. These estimates of the engineering department are confirmed by the bids of four of the five bidders, each one of whom has had

more or less experience in this particular kind of work. In an analysis of the bid of the lowest bidder his figure on masonrywork, with which he is familiar, are approximately correct, according to the best evidence obtainable, but in the items of excavation and embankment his figures are over 2,000,000 dols. less than the next lowest bidder. In regard to their bid, Mr. PEIRCE, of the John Peirce Company, the lowest bidder, states that in the matter of excavation and embankment for reservoir construction, his company has had no experience, that they were dependent upon others for their figures, and that upon investigation he can procure no figures on these items to protect their proposal, and that upon rechecking his figures he finds that the estimate is too low to do satisfactory work for himself or the city. Therefore the estimate of the engineering department and four bidders out of five is practically confirmed by the statement of Mr. PEIRCE himself, and there is no other conclusion to be reached, in the light of this evidence, than that the bid of the lowest bidder is much below the necessary cost, besides being concededly based upon lack of knowledge and experience as to excavation and embankment items. To best secure the efficient performance of this work it is necessary that the Board of Water Supply should take into consideration every phase of the question, the elements of which are financial standing, knowledge, experience and such a margin for profit as will secure willingness and ability to continue the work to its conclusion with essential speed, the absence of any one or more of these elements being vital. Your committee therefore recommends, in view of the report of the chief engineer and the reasons set forth therein, and the answers to questions submitted to each one of the three consulting engineers, Messrs. FREEMAN BURR and STEARNS, which are herewith submitted, and which concur, supported by such additional thought and judgment as it itself has been able to bring to bear upon this subject, that contract No. 3, for the construction of the Ashokan dam, be awarded to MACARTHUR BROTHERS Co. and WINSTON & Co., at their bid, which, on the assumed basis of quantities amounts to 12,669,775 dols., the committee having satisfied itself as to the financial standing, knowledge, experience and ability of the said company to do the work."

## ILLUSTRATIONS.

SANDROYD SCHOOL, COBHAM.

THIS group of buildings has been erected on an elevated site near Cobham, Surrey, for Messrs. C. P. WILSON & W. M. HORNBY, and comprises a complete boarding school, with dining-hall, chapel, play-rooms, cricket pavilion, swimming bath, laundry, electric-power station and playing fields for eighty boys. The building is of local red bricks with Bath stone dressings, and the roofs are covered with sand-faced red tiles. The building is considered the most up-to-date boarding school of its kind in England, and no detail has been overlooked to make it so. The general contractors were Messrs. MARTIN, WELLS & Co., of Aldershot. The whole building was heated on the "Wreck" system by Messrs. HADEN & Co. and the consulting engineers for this and for the whole electrical work were Messrs. O'GORMAN & COZENS HARDY.

The architects were Messrs. TREADWELL & MARTIN, of Charing Cross House, W.C.

THE MAPPIN ART GALLERY, SHEFFIELD.

# UPTON.\*

would be pardonable for the casual visitor to suppose that the town of Slough was also the parish of that town, and he would expect to find in it an ancient parish church, or at any rate a successor to an ancient building. As a matter of fact, Slough is a comparatively modern town, whose growth has been continuous with the progress of the railway. Slough is in the parish of Upton-Chalvey; the mother church is that of St. Laurence, Upton, a most interesting structure. As a consequence of modernity, there is little of interest in the town of Slough, and perhaps the chief point is the fact that it is the home of the Herschels. M. Arago, the great French astronomer, writing of what was then the village of Slough, "C'est le lieu du monde où il a été fait le plus de découvertes," referring to the work of Sir William Herschel. The great observer came in April 1786 to Slough from Datchet, when he took the precaution to cut down all the trees, in order to allow free ocular communication between himself and the heavenly bodies. His astronomical researches were shared by his sister Caroline, who lies buried in Upton churchyard, while Caroline herself died in Hanover. The house in which they resided, the Windsor Road, although the front portion, bearing the title Observatory House, is a modern addition. It is occupied by the Herschels, and a small portion of the old telescope remains, the circles on the lawn indicating its position.† But the object of our visit is the very beautiful church of St. Laurence, Upton. Built originally about the year 1058, it was enlarged in 1250, the tower raised and the nave tiled about 1400. After this the nave was extended some 10 feet. In 1835 the church was in disuse and was pulled down, a sham Norman building, St. Mary's, having been erected in Slough in that year. This pseudo-Norman is gradually disappearing by rebuilding as funds permit. Bishop Wilberforce called it "a barn-like edifice," and acquired the plate, bells, registers and even the name of the church. It was desired to supersede, for it was known to be Laurence's for a time. To return to Upton Church, which seems to have been doomed to destruction, but Mr. W. K. a local farmer, gave 50*l.* to the parish on condition that the old church should not be destroyed. In 1850 it was saved by Mr. Ferrey, a south aisle added, and it was restored by Bishop Wilberforce in 1851. The restoration was far from being a conservative or preservative one, but might be expected from the date at which it took place. The church is a most interesting example of a Norman church; the north wall of the nave, the chancel and the tower are Norman of an early character. On the north wall of the nave may be seen an earlier opening which is now blocked up, as at St. Peter, Iver; this has been called Saxon, although it does not present any specific features of work of that period. The quoins of the Norman tower are to be seen about 18 feet from the present ground level, and the position of the original north doorway of the church is indicated by its position in the north wall. Perpendicular windows were inserted in the nave in the east wall of the chancel, but the latter was removed in the restoration of 1850, and replaced by two nineteenth-century Norman lights. At the same time the north wall of the nave was destroyed and rebuilt in that style of Norman which always offends the taste of the lover of ancient architecture. The south doorway is of this date, and the material of the old wall was used in building the new one, and some of the stonework of the old windows was inserted in the process. The narrow chancel arch, which was about 4 feet 3 inches wide and 12 feet high, was pulled down and the stones re-erected, together with those of the blind arches on either side, at the east end of the south aisle. The tower was also lowered by about 10 feet, and the present cap placed on it. A Perpendicular window on the nave north wall was also displaced by two round-headed windows of the objectionable type. It was said that "a beautiful rood-screen was found in fragments to the tower, fragments of which had since been made into a frame for the Commandments in the new church." Mr. Myers, whom I am quoting, thought that if the screen had been entire it would have been one of the finest in the county. Its date was about the fourteenth century. The register dates from the first day directed by

read by Mr. Theophilus Pitt, F.C.S., at a meeting of the Norwood Athenæum.

Professor Alexander Stewart Herschel, D.C.L., F.R.S., Professor of Physics and Experimental Philosophy at the College of Science, Newcastle, died at Observatory House on June 18, 1907.

the Act of Parliament of 30 Henry VIII., viz. October 23, 1538.

Near the north door is a curious tombstone "To the memory of Sarah Bramston, spinster, a woman who dared to be just in the reign of George the Second." Miss Mary Russell Mitford says of Upton Church:—"We visited the old church at Upton, whose ivy-mantled tower claims to be the veritable tower of the 'Elegy.' A very curious scene did that old church exhibit—that of an edifice not yet decayed, but abandoned to decay, an incipient ruin such as might probably have been paralleled in the monasteries of England after the Reformation, or in the churches of France after the first Revolution. The walls were still standing, still full of monuments and monumental inscriptions; in some the gilding was yet fresh, and one tablet especially had been placed there very recently commemorating the talent and virtues of the celebrated astronomer, Sir John Herschel. But the windows were denuded of their glass, the font broken, the pews dismantled, whilst on the tottering reading-desk one of the great prayer-books, all mouldy and damp, still lay open." Such was the state of many an ancient church, not only at the time Miss Mitford wrote, but even some forty or fifty years later.

ST. LAURENCE, UPTON: NORTH DOORWAY.

The removal of whitewash from the walls revealed a great deal of coloured painting, including scenes from Our Lord's life, as well as some consecration crosses; the colouring which appears now has been retouched. The circular font is Norman; it has twelve round-headed panels, and was returned to the church from the new one, whither it was taken when the old church was abandoned in 1837. There is also a Norman piscina of pillar shape now in the chancel, as is a portion of an alabaster figure representing the Blessed Trinity. It is one of the anthropomorphic representations of the Eternal Father which sometimes occur in Mediæval work. He is holding the Son between His knees, and doubtless the image was surmounted by the Holy Dove, as representing the Third Person of the Blessed Trinity. There is also an interesting carved wood blind arch of the thirteenth century with dog-tooth ornament and foliage. Now at the east end of the new south aisle, it was formerly on the north side of the chancel arch. There are traces of gold and colour upon the wood, as also upon the alabaster image just mentioned. Of the monuments the most interesting are the brasses to members of the family of Bulstrode—Edward Bulstrode, Esq., his wife and children, 1599.

Upton Court is a very charming house on the south side of the church. It belonged to the canons of the Augustinian priory at Merton, and at the Dissolution passed into private hands; amongst others it was owned by the families of Hungerford, Eaton, Lane, Lascelles and the Earldom of Harefield. Among its tenants have been Mr. Nash, Mr.

More, Mr. Jennings, Mr. G. A. Sala, Mr. Nelson, Sir Douglas Forsyth (the Oriental traveller), Mrs. Drummond and the present occupier, Mrs. Burton. George Augustus Sala says of it:—"I resided five-and-twenty years ago in a dear old house called Upton Court—a weird and ancient mansion with high-pitched thatched roof and dormer windows, a very antique manor-house of the Tudor period, I should say." Again he says:—"How often on calm summer evenings, from the garden of my old house at Upton, have I looked between the two tall elms across the busy farmyard, athwart the fat meadows with their solemn cows, along the steaming meads of Datchet, across the bright white Thames, and watched the distant vision of Windsor's castled steep—its shadows bluer than David Roberts ever painted the dome of St. Peter's towering in the far-off Campagna—and I have seen the Round Tower all at once turn fiery red with the last rays of the expiring sun. Then the shadows of night have come down upon it, down, down, down, and then in tower after tower, and along the façade of the terrace, the windows have been lit up, and from the number of the illumined casements I have speculated upon the brave doings and grand company in the Castle." He further describes the Court as having a lake in front; this has been filled up and a lawn takes its place, a garden all run to exquisitely picturesque wildness and a rosary with eighteen varieties of roses. To these must be added a ghost who wore a white night-gown richly frilled, with a large stain of blood on the left breast. She always walked on Friday night, and her footsteps crunched the gravel paths as she went, according to the servants. Gipsies! says Mr. Sala. Mr. Myers says that "formerly two of the outer doors of Upton Court opened upon a sort of half quadrangle. The fabric is pretty nearly full-timber frame, and inside it contains some very sturdy beams. One, in particular, passes through two floors and then forms a roof beam. There is one very large room, which was possibly the refectory; in it is a large chimney, and connected with it there is a secret room, the existence of which can be plainly discovered by tapping the walls. In the room now used as a drawing-room are two recesses, which, no doubt, were formerly cells of the monks. There were several interesting and valuable examples of foreign glass in the building, principally Dutch."

#### LIVERPOOL CATHEDRAL.

THE walls of the Liverpool Cathedral are rising slowly, but surely and solidly, above the soil of St. James Mount. The building of a cathedral is not a work to be hurried. Destined to last through the ages, scrupulous and painstaking care must be devoted to every detail and soundness and solidity form the stamp on every brick and stone. Some impatient critics, says the *Liverpool Courier*, have contrasted the slow rate of the work with the rapidity of construction of such buildings as the new Cotton Exchange and the Dock Board offices. The comparison seems to bring into contrast the methods of English Mediæval building and the modern mode exemplified in the skyscrapers of New York or Chicago. The two are as the poles apart. In practical fact no such comparison is possible, for the style of building is fundamentally different. The modern buildings instanced have a framework of steel with cross sections, and upon this skeleton you can run up a building as quickly as workmen can be crowded upon the structure. A cathedral upon such a plan as Liverpool's is an assemblage of buildings, massive in all parts and with no such skeleton framework embracing the whole. Even with the best appliances that modern ingenuity can devise the process of erection must in the nature of the case be slower than in the steel-framed structures built for business purposes. Any such comparison is futile.

As a matter of fact the progress of the cathedral is entirely satisfactory to those immediately concerned. The foundations, gigantic works in themselves, were completed in the spring of last year, and in July the superstructure was commenced. To-day very considerable progress has been made with the lady chapel, which will be the first portion completed, while the main wall of the cathedral choir is simultaneously rising. The first steps were taken last week in fixing the base of one of the massive piers which will rise 80 feet in the air, while the bases of other piers are already in position. A glance at these ponderous masses of masonry will indicate the vast size of the tremendous piers, not built around a steel shaft, but of solid rock resting upon the solid rock beneath. The lady chapel will be complete and ready for use in three years.

Of its total height of roughly 120 feet the structure now reached about 33 feet. Within the last fortnight sills for the clerestory windows have been fixed at the corners of the eastern vestries placed in position. There is now there is some indication of the beauty of the completed edifice with its Gothic ornamentation and design, and passages, steps and arches have all that appearance of combined solidity and grace so charming in ecclesiastical architecture. The main wall of the choir now rises 9 or 10 feet, and the doors of the vestries are well on. It is in the lady chapel, however, that the visitor will find the greatest evidence of progress, and very interesting find it to watch a cathedral in the making.

Visitors to the site have been rather numerous, and it is to be feared that their presence has to some extent hampered the operations. Some care has to be exercised with strangers. To what length the audacity of the hunters may go is shown by a sensational incident, before published, which took place on the day the foundation-stone of the cathedral. A well-dressed man, apparently of perfect respectability, was detected in an attempt to chip off a piece of the foundation-stone. Needless to say, he was removed with all haste from the premises. The stone is now covered in a wooden frame, and the example of the enthusiast is not to be followed. Apart from such parties, it is found that visitors delay the operations by engaging the workmen in conversation as to the structure, or pursuing inquiries upon all sorts of details. In consequence of this it has been found necessary to curtail to some extent the visiting privileges. At present an average of some fifty persons visit the site during the week, while on Saturdays, at a time when work has ceased, large parties of Sunday scholars are taken by their teachers over the site.

Another point in connection with this matter is the question of liability for accident. A tour of the site occupied as it is by masons at work, with large quantities of hoisting stones and gang planks spanning deep holes, is unattended with danger. The Employers' Liability Act may possibly apply in case of accident, and steps have been taken by the contractors to cover themselves against it. Each visitor has now to sign his name in a book on the page of which is printed the following:—

"I, the undersigned, hereby acknowledge that I have obtained the permission of the Liverpool Cathedral Committee to visit the work in connection with the building of the Liverpool Cathedral at my own personal risk, and in consideration of so allowing me to inspect such work I undertake not to make any claim against you, or anyone in your employment in respect of any injury I may sustain from any whatsoever during the time I am on the premises."

Having signed this declaration and being provided with a ticket of admission obtained from the Cathedral House, the visitor is at liberty to inspect the works.

Apart from the actual structure of the cathedral building, there is much to interest him, and perhaps the first point to engage his attention will be the huge masses of uncut stone which are piled up on every hand. There is about 50,000 cubic feet of stone on the premises, weighing some thousands of tons. This is all sandstone and brought from the quarries at Woolton, Runcorn, Helsby and other hills. Some of it, of a harder kind, comes from the Dean, and is used for the steps and landings. This stone is carted to the works daily at the rate of some three or four thousand feet in the week. It is dressed on the site by masons with their labourers, some 160 men, who are constantly at work in their sheds chipping and shaping the stone. Stone saws are at work dividing the masses of stone into seven large cranes electrically driven transfer huge blocks from place to place. Some of the cranes travel on a metal roadway and convey the blocks with wonderful speed and certainty. All this is done in what is necessarily a very circumscribed area, and the visitor will find it necessary, therefore, to exercise caution. Mallets and crowbars are at work all around him, the cranes are swinging great lumps of rock through the air, and he will have to frequently the lines along which the travelling cranes are moving. Proceeding towards the lady chapel he will traverse slippery gangways over the yawning foundations and descend sloping planks beneath a network of scaffolding. As may be imagined, some care is required in making such a tour, but it will nevertheless be found of stimulating interest. Here is the cathedral ground under one's eyes, a fabric which will be a glory to the Church and a source of worthy pride to all who look upon it, however humbly, to raise it.

## BIRMINGHAM AND ROMAN BRITAIN.

THE Transactions of the Birmingham Archæological Society, of which volume xxxii. has just been issued to subscribers, contain an exceptionally interesting paper by Mr. G. Bernard Benton upon "Early Earthworks, and Hollow Roads of the Upland of Barr and Sutton Fields." The history of Birmingham as a town is comely modern, says the *Birmingham Daily Post*, but it is upon the border of a district which was of considerable importance, both in Saxon and in Roman times. A new "Dictionary of Birmingham," now out of print, says:—"We have no record or traces whatever of there being inhabitants in this neighbourhood before the seventh century, though there can be little doubt that in the time of the invasion of the Romans some British strongholds were situated a few miles of the place, sundry remains having been found to show that many battles had been fought near it." It is also generally known that Icknield Street derives its name from an ancient Roman, and not improbably, highway which crossed the country near the Hockley Hill, and of which portions are still traced on Park on one side and the foot of Weatheroak Hill on the other. Beyond this, however, the average citizen of Birmingham little dreams of how important the late neighbourhood must have been during the time of the Roman occupation. Mr. Benton, however, touching the subject from the point of view indicated in the title of his paper, says:—"This road, the great Icknield Street, from St. Davids to Northumberland, communicated by branches (which must have been in Birmingham) with Cirencester and the South coast, and by Worcester and Gloucester with the other Channel ports. Of other smaller roads one is that which Queen Henrietta followed from Walsall, Tamebridge, Sandwell, Smethwick, and Warborne, the Icknield Port Road, in fact; one connecting Birmingham with Roman Coventry; another, a street, with Roman Tamworth. It was this latter road, running to Salford, the decay of which in the valley of the Aston Brook led in the fourteenth century to the formation of St. John's, Deritend. It had branches by Lane to Boldmere, by Erdington to Sutton, and by Shepherd's Green, where its ancient surfaces were discovered in the garden of Wood End House, paved with pebbles, accurately curved and accurately positioned, 2 feet 6 inches below the surface, for the formation of a "road under the ground" here, which we have always misunderstood as a subterranean passage. Its last branch which I regard as the Roman course of the road to Northworth Lane. The Wolverhampton road was rediscovered in the eighteenth century, "breaking away on your way to leave Birmingham," for until this discovery was made while the coaching book was in the Press) the road which had been attracted to Birmingham by the iron and its manufactures were actually wont to clamber back to the confines of the coalfield in order to resume their journey through Walsall to Wolverhampton.

*Fortress at Castle Bromwich.*

THE attention which has been given to the Roman roads has, Mr. Benton urges, obscured the significance of the other great roads which are numerous in the upland and salt districts. Speaking in particular of the Ridge Way or Ridge Road, which he is convinced was originally planned in straight lines from Castle Bromwich to Barr Beacon, he pictures as follows the fortress of the former place commanding the crossing of the river:—"Everyone has been impressed by the commanding position of the church at Castle Bromwich—the castrum of (Wido de) Brame-wic. I wonder how many of the river have felt in ascending the hill that they were entering the main gate of a fortress. The ancient road of the Tame by the Chester Road seems to have been the mill, or by way of the island which the weirs form. The river itself in ancient times flowed uniformly at the foot of the hill, itself a notable ridge, extending from Wood End to the little island dun of Water Orton, forming one of the most remarkable series of natural moats to be found in the country. Arrived at the further bank, the wayfarer was compelled to turn back, being imprisoned between the water and a precipitous bank on his right; if he were an enemy he thus exposed his side to the weapons of the garrison above. This position was continued until the present course of the high road was reached, and here he found himself at the left clavicle of the gate, about where a

bench now stands, while to his left was a slight expanse of level ground with the Gate Well, now the Well of Saint Catherine. Turning in to the right the course of the highway is still dominated by ramparts until near the church access was gained to the interior of the fortress. If we now go right through the camp and turn to the left through the village, we find a lane on our left descending to the river. For some distance it is but little below the ground level, until near where a lateral gate of the fort should be it turns slightly to the left, and approximating more nearly to its ancient depth, it descends from 9 to 15 feet into the hillside. We are now in the ditch, which continues to get deeper until the ground opens above the river; here the road, emerging upon the surface, turns to the right and finishes the descent as a traverse; but the cutting itself turns sharply to the left and fashions the steep hill face into a tree-encumbered precipice with the river gurgling at its base. Now if we climb that dangerous bank we find ourselves in the ditch below the ancient rampart of the water-front. We may follow this rampart till it is broken by a coomb, which possibly formed another gate opening upon a meadow below; then below the tumulus we continue along the sandy bank until we again find ourselves at the clavicle of the gate. The great mistake which has hitherto been made by archæologists who have examined these works has been to regard this half as the whole of the camp. If we now follow the roadway again for about 100 yards, a line of trees will be perceived in a meadow on the right below the church. These occupy a low mound of soil claimed as a road by the peasantry. It occurred to me at once that this was a ditch which had been filled with rubbish. Its slight curve out toward the river suggested the right clavicle of the camp gate. I proceeded to follow it with increasing confidence until it suddenly lay open at my feet—a great cutting through the clay, some hundred yards in length, 10 or 15 feet deep—and beyond again the filling and planting scarcely disguise the continuation to a low lying moat or pit which occupies the north-western salient. From here a ditch, now filled in over drain pipes, conducts the drainage to a moat upon the river. This ditch must once have served to prevent an enemy from running in from the west, between the front and the water. The road approaching the mill from the west was squeezed between this moat and the river bank. The south-western face of the camp proper is represented near the high road by a broad sunk ditch, but between this point and the river angle time and dismantlement have done their work so well that little remains which would catch the eye of a casual observer."

*British Bricks and Roman Mortar.*

REFERENCE is made in Mr. Benton's paper to numerous traces of earthworks in the neighbourhood of King's Standing and Welchman's Hill, where the Ryknield Street crosses the Ridge Way. He mentions an inquiry which was addressed to him by a small farmer in the neighbourhood as to "when folk made bricks very thin—call 'em bricks; they were more like kitchen quarries for shape, but awfully badly made; slapped together anyhow, warped and curved like." "It seems," says Mr. Benton, "that in the gardens of the old Bell House cottages, where he once lived, he discovered a wall 2 or 3 feet below the surface. It was built of these British bricks in hard white mortar. On my suggesting that I had seen such bricks bearing the marks of boots and hooves, he exclaimed, 'Men and children had run on what I found with no shoes on; lots on 'em.' He at a later date enlarged this statement and called his wife to corroborate the footprints. It seems that the Roman mortar broke his tools, and he gave up all attempt to remove the wall." It is interesting to note that this spot is exactly midway between the pretorian site of the fortress of Castle Bromwich and the Castle Field of Welchman's Hill, and is also midway between the ancient camp of Salford Hill and the Manor Hill at Sutton.

*Passages of the Tame—Perry Barr.*

AFTER pointing out that "every ancient passage of the Tame proves upon close inspection to have been commanded by works, the construction of which leaves no doubt that they were made by the legions," Mr. Benton dwells in some detail upon the indications of a line of dykes and pits connected with a static camp near the Holdford farm (now absorbed in Kynoch's estate), "large enough to contain one of those great consular armies which assembled when all the legions in Britain raised to double strength, with their auxiliaries, were mustered for some great enterprise." "To form this castrum a new bed was cut for the

Tame, which was thus constrained to form a broad and deep moat at least 2,230 feet in length, the original camp being a square of this measurement facing north. Within this moat, and parallel with it, were constructed two long pits, about equidistant from the centre and a furlong apart. Each pit was upwards of 130 feet long and perhaps 40 feet wide. At these points the broad cross-roads of the castrum are distinctly seen 60 feet wide. The bridges crossed the moat to the tongues of land isolated by these pits to which the water was admitted. By a clever arrangement of weirs, water from the moat was let down into the original bed of the stream, which was thus most cunningly made to form an advanced work covering the approaches to the gates and to the exposed north-eastern salient; it was thus rendered impossible for an enemy to attack this face on a broad front. The eastern moat had a length of 1,410 feet to the mill, which I consider was the fabricum; the rectangular pool had cunningly protected approaches, while pits without and a re-entering ditch within covered the road from Witton Ford (still traceable under the ammunition cabins). It is only part and parcel of the profound romance of archæology to note that, all unnoticed, this re-entering ditch drawn by Romans to protect a forge which armed their legions has dictated the curious position of a factory which supplies millions of cartridges to British troops after the lapse of 1,600 years. The south ditch of the static camp was a hollow lane now filled up (it is by this road that the mill is still approached); the gatepits on its north side are still faintly traceable. The pretorium occupied its normal position in the centre. Its foundations possibly lie under half of the existing house, and extend thence eastward to the ditch which divides the camp north and south. It has been stated by high authorities that even such important cities as Anderida were not walled on their water front, but perhaps we should not trust this theory unless it were proved by excavations carried to great depth that the whole of the accumulation of silt on these lower sides had been probed. However that may be, there seems to have been a wall of great breadth within the north moat at Perry. Some of the farm buildings contain much stone dressed with Roman scappling, and one shows faintly a letter or two of inscription."

"It has been the custom for some considerable time to speak of the (Perry) bridge as Roman. Against this," says Mr. Benton, "I felt originally the strongest prejudice, but I now have not any doubt that the deviation of the high road was made under the Empire, and that the bridge was permanently built in its present position at a time when a magnificent station was set up in the north-west angle of the works; the ruins of this establishment choke the gardens of Perry Pont House with thousands of tons of stone, while all the materials common in the hypocausts and other works of such mansions as Woodchesters have been utilised in the vinery and other parts of the buildings. There are, too, inserted in the numerous grottoes more than a dozen grotesque heads carved in stone, and exhibiting the characteristics of some of the best Roman work of this character found in the provinces. I saw also one small head of a portrait type with beard and whiskers of the Antonine period."

The author of the paper hopes that his research may stimulate further inquiry, and may cause archæologists to pause before consigning to the doubtful "Early Norman period" all fragments of Romanesque workmanship which from time to time come to light.

#### SCOTS COLLEGE IN PARIS.

NO one would have thought that Scotland would be drawn into the *engrenage* of the struggle now going on in France between Church and State. The struggle is, of course, nominally over, as the separation has been decreed. But it will go on for many a long year still, says a correspondent of the *Glasgow Herald*, about the property of the Church confiscated by the Government, and it is by this seizure of Church property that Scotland has been drawn into the matter.

The French Government, with the other Church property, seized the Scots College in the Rue Cardinal Lemoine. Against this the British Government has entered protest, and negotiations for its surrender are being conducted by the British Ambassador and M. Briand, Minister of Public Instruction. To this department the former Ministère des Cultes, or Ministry of Ecclesiastical Affairs, belonged, and it is M. Briand who is entrusted with the difficult task of carrying out the liquidation. The seizure of the Scots

College was to many people the first revelation of its existence. I confess that though I had heard vaguely that there was such an institution I had never seen it and did not know where it was situated.

The history of how it came to be seized by the Government is a somewhat curious one. The Scots College was founded by King Robert the Bruce. At the time of its foundation there was a healthy rivalry between John Baliol as to who should do most for education in Scotland. Baliol favoured English influence and founded the College at Oxford. Robert the Bruce declared in favour of French education, France being the ally against the enemy, England. He accordingly founded the Collège des Ecossois in Paris. The year of its foundation was 1362.

The first building was in the Rue des Amandiers, which was in the vicinity of the quarter where the Scots lived in the Rue des Ecossois. But in the latter half of the seventeenth century the then Principal had the college moved to the existing building in the Rue Cardinal Lemoine. This lies on the eastern slope of the hill on which the Panthéon stands, a stone throw from the beautiful church of St. Etienne du Mont.

It is not a particularly striking building from the exterior. A large barrack-like erection, five storeys high, it stands on the eastern side of the street. Over the main entrance is the keystone of the arch, are the words "Collegium Ecossois," the old spelling of the word "ecossais" being preserved. The windows on the lower floor are barred, as the college was used as a prison during the Revolution and Terror.

The college is still used for educational purposes, known as the Institut Chevalier, a school of the high grade which prepares young Frenchmen for the *baccalauréat*, the French degree of Bachelor of Arts. But if the exterior is plain, even to ugliness, the interior is all the more interesting. A handsome oak staircase of monumental proportions, black with age, conducts to the first floor. It is lighted by large diamond-paned windows with a border of blue glass.

On the first floor is the chapel, which has happily been respected and left exactly as it was 300 hundred years ago. Above the entrance door is the inscription "Hic habitavit Sanctus Dei cum Hominibus." It is not very large, but able to seat from 150 to 200 worshippers. It is oblong, and except at midday, when the sun's rays stream in by the four windows, is but dimly lighted. The windows, like those on the staircase, are diamond-paned and lighted with ancient stained glass. On them and above them is the monogram of King Robert the Bruce, surmounted by the Scottish Crown. The altar is plain, almost to the point of being tasteless, but the effect of the chapel is impressive and artistic in the highest degree.

On the walls are marble tablets with time-worn inscriptions, mostly to the memory of Scottish soldiers who fell in continental wars. The only thing missing from the whole chapel is a large marble tablet on which are inscribed the names of the students of the Institut Chevalier who fell in the war of 1870.

The chapel is preceded by an ante-room, which is less interesting than the chapel itself. It has hanging from the roof a large lustre in gilded bronze, a fine example of the metalwork of the seventeenth century. But the most interesting thing in the ante-room is the sarcophagus of dark marble set into the wall near the entrance to the chapel. Here, in a silver casket, reposes the body of James II., the last of the Stuart kings. On it is an inscription "Memoriae Augustissimi Principis Jacobi Magnae Britanniae, &c., Regis, 17 October, M.D.C.C. the opposite side of the room is a large tablet in black marble to the memory of Frances Jennings, Duchess of Tyrconnell.

In this room formerly hung two portraits of the Pretender and his father. These have, however, been removed to a small room, which the Principal of the Institut Chevalier uses as a study. This is somewhat to be regretted, as the light is not particularly good for the pictures are not seen to the best advantage. The Pretender is represented at half length, but the portrait of the Young Pretender is a full length one. He is shown bareheaded on a promontory in gold-chased armour, with plate, greaves and arm-pieces. The broad blue ribbon of the Order of St. Louis stretches across his chest. Below him a fleet is seen riding at anchor. Toward his right arm is pointing as if giving orders for the engagement.

The Scots College at one time possessed a large collection of historical records, viz. the cypher correspondences of the Pretender and his father.

d between the two Pretenders and the Jacobite leaders England and Scotland. These were in the college at outbreak of the French Revolution, but since then no of them has been found. One story states that they removed to a convent in Normandy, another that they sold as waste paper. In any case they are hopelessly unless some clue to their whereabouts exists in the res of the Vatican. They were first deposited at the e in 1701, when Lewis Innis was principal. Hume hem when he visited Paris in 1748.

I this, however, does not explain how a Scottish insti- like the college should have got involved in the ut conflict between the French Government and the h. It came about in this wise. Though, according to iginal charter, if the college was founded "for the al education of Scotsmen with a view to increasing the ctual influence of France in Scotland," the greater er of students were students of theology, and perhaps time were exclusively so. The result was that when, g the French Revolution, the property of the Church was cated, the Scots College was also seized. When eon I. established the Concordat with Rome the Scots ge was set free with the rest, that is to say, the French nment still claimed it as its property, but allowed the es to be devoted to their original purpose, as they then (erroneously) supposed to be, that is the educa- of young Scottish priests. The management of the ge was handed over to the *économé* of the Catholic nary of St. Sulpice, and all the existing archives were rferred to his keeping. The college itself was let, and nds derived from this and other sources was devoted e education of young Scottish priests, chosen by the ate of Scotland. The other source of income of the College is derived from the rent of a farm at Grisy, Paris, which is the property of the foundation.

en came the present conflict between the French nment and the Church, which ended in the denuncia- of the Concordat. The property of which, under the rd, the Church had the use again came back to the nment. In consequence of the original error made g the French Revolution, the Scots College shared the of the rest. The Seminary of St. Sulpice was closed he students expelled, the Scottish students with the

is against this that the British Ambassador has entered st. It declares that the original purpose of the college general and not exclusively religious. That it became s a mere accident, which in no way affects the original er. The application of the revenues of the college to y theological—and Roman Catholic—teaching is uned- edly contrary to the intentions of its founders. In rt of this contention much evidence has been collected. the Reformation in Scotland the principal and pros- were laymen, and many famous heretics studied , including Buchanan, the Freethinker; Mair, a revola- ry Protestant; and Barclay, the Quaker.

the middle of the eighteenth century the Papal Nuncio, ng to the Pope, denounced the Scots College as a hot- f Jansenism. This deplorable state of things, he de- d, was due to the teaching of one Thomas Innis, who een prefect of the studies at the end of the seventeenth ry. There is, therefore, no doubt that in being devoted sively to the teaching of Roman Catholic students enues of the college had been "side-tracked" from original purpose.

. Briand, the Minister of Public Instruction, has met British Ambassador in the most friendly spirit, and asks proof to be given him that the foundation was not ely Roman Catholic one to surrender the revenues to original purpose, that is to say, the general education ng Scotsmen in the French capital.

ie matter has been taken up by Sir Thomas Barclay, ell-known international lawyer in Paris. He proposes money should be raised in Scotland to purchase the e from the French Government. It is valued at 400,000 francs). As, however, the French Govern- only holds the property in trust, and has hitherto ed the revenues derived from the letting of the college e farm at Grisy to the purposes (as they conceived of the foundation, this sum of 16,000l. when paid to would still be held in trust for the purposes of the e. The purchase would merely give the purchasers ee disposal of the building, while the amount paid by to the French Government, and held in trust by the, would form the nucleus of an endowment fund. The e would therefore be free of debt and have a revenue

of 480l. (the interest at 3 per cent. on 400,000 francs worth of French Government Rentes), plus the revenues of the farm at Grisy.

Sir Thomas Barclay proposes that the building should be restored to its original use, and that the Scottish students should be lodged there as formerly. He thinks that the matter should be taken up by the four Scottish Universities, whose principals should *ex officio* be trustees of the college. Students of all kinds would be admitted, art students, students of music, &c., as well as those studying for the liberal professions. It would be a new link in that *entente cordiale* between France and Scotland, an *entente* that dates back nearly seven centuries.

## SUSSEX ARCHÆOLOGICAL SOCIETY.

THE sixty-first autumn meeting of the Sussex Archæological Society, held on Monday, will be remembered as one of the most enjoyable outings that that body has ever organised. The district visited—Eastbourne and Pevensey—says the *Sussex Daily News*, is peculiarly rich in relics of the past, and apart from the archæological interest of the excursion there was the pleasure of the long drive through quiet country lanes with the rolling Downs never long out of the picture. When it is added that most glorious summer weather prevailed, it will be seen that nothing was lacking to complete the success of the day. The party was an unusually large one, numbering no less than 230, nearly double last year's record. The large party was drawn from all parts of the county, and assembled at Eastbourne railway-station a little after ten o'clock. Brakes and char-a-bancs were in waiting, and in these the party were conveyed to the first object of interest, the ancient parish church of St. Mary.

### St. Mary's Church.

When this building was reached, Mr. P. M. Johnston, architect, who had undertaken to describe its features, had not arrived, and accordingly the Rev. W. Budgen stepped into the breach and gave an interesting sketch of its early history from the day when in 1054 King Edward the Confessor made a grant of a church and its endowment to the abbot of Fécamp, in Normandy.

Mr. Johnston arrived shortly afterwards and continued the story, explaining that in 1160 the work of rebuilding the church was undertaken—an operation which lasted some twenty-five years. The earliest feature of the church as it now stands is the chancel arch. Mr. Johnston drew attention to the remarkable suite of mouldings on the arch—the nebulé ornament of the outer order, and the chevron or zigzag of the inner. The nebulé ornament, he explained, is not very often met with, and this is, indeed, the only instance of its occurrence in Sussex. Other peculiarities noted by the speaker were the remarkable deviation to the north of the axis of the chancel and the step down into the chancel—the latter owing, no doubt, to the fall of the ground towards the north-east. A great number of fish markings in the stone on the arches of the south side of the chancel suggested that they were built with the proceeds of a toll on fish. The nave was of later date, and the style became fully developed Early English, whereas in the chancel it was the earlier, simpler and far more beautiful work of the transitional Norman period. The occurrence of a clerestory was unusual at this early date. Mr. Johnston also drew attention to the almost unrivalled early screen-work between the arches of the chancel, the Flamboyant window in the east wall of the chapel, which he had the pleasure of restoring from a very mutilated state a few years ago, the perfect rood-stair turret on the north of the nave, the second rood-stair in the south-west pier of the chancel, the Decorated font, the Easter sepulchre, on the north and the range of piscinas and sedilia on the south of the chancel.

A hurried visit was paid to the quaint old parsonage house near by, and also to the crypt under the Lamb Inn, presumed to be part of the original thirteenth-century inn. With respect to the former Mr. Johnston stated that steps had been taken to acquire it for use as a sort of church house, but owing to lack of agreement between the parties concerned these had come to nothing.

### Langney and Westham.

The drive was then continued to Langney. The object of interest here was a building which was originally a grange of Lewes Priory and was occupied by a succession

of well-to-do tenants till the Reformation, but is now a farmhouse. The fourteenth-century chapel still remains, and this was inspected with much interest. Another short drive brought the party to Westham Church. Mr. Johnston pointed out three perfect Norman windows in the south wall of the nave, and also drew attention to the transept with its Norman arch—probably one of two, the other having been destroyed when the church was widened. The roof, he said, was of quite exceptional width for a Sussex church—no less than 24 feet. There was a very fine rood-screen, the remains of which are now to be seen at the west of the church. Three piscinas are distributed about the church, each with its little credence shelf. At the conclusion of his paper Mr. Johnston made the sad announcement that the Bishop of Chichester had passed away that morning.

#### *Pevensey Castle.*

At Pevensey Castle the rôle of guide devolved on Mr. L. F. Salzmänn, who described in detail the excavations which are now in progress and the results achieved so far. After an interval for lunch at the Royal Oak, the party returned to the castle, where Mr. Salzmänn dealt with the later history of the building from the time of the Conquest, when it came into the hands of Robert, half-brother of the Conqueror, who threw up the keep mound, probably dug a moat and also repaired the Roman walls.

In 1250 the property came into the hands of Peter of Savoy, who seemed to have built the present castle, so that in 1264, when it was held for six months by the Royal against the Baronial forces, it was comparatively new. Mr. Salzmänn pointed out the design of the building, and explained that the garrison would be a very small one from the modern point of view. The professional troops did not seem to have numbered more than twenty or thirty men at any time, besides which there would have been various tenants of lands in the neighbourhood who owed knight's service, probably commuted for a money payment after the thirteenth century. The towers were for the most part covered with lead, which protected them for some time, but in the end was the cause of their ruin, because it was

the most valuable thing in the castle, and the royal ov decided to strip it off and sell it. In 1573 when the castle was getting ruinous the lead was valued at 253*l.*, while the woodwork was only worth 60*s.*, the iron 5*s.*, and there was no glass left in any of the windows. In 1541, 5*l.* was for 600 loads of the square facing stones, which were used to build Priesthaus. Nothing but the difficulty of getting the stones at a higher level seemed to have preserved the castle. Canon Cooper expressed the thanks of the party to Mr. Salzmänn and Mr. Johnston for their papers, and also appealed for support to the fund which is being raised to secure the Barbican House, Lewes, as the home of the Society. The purchase price is 2,000*l.*, of which 900*l.* has been raised.

#### *"Priestholes" at Glynleigh.*

A hurried visit was paid to Pevensey Church, where Mr. Johnston pointed out the many features of interest, and also expressed the regret of Archdeacon Sutton that, owing to the death of a relative which called him away, he was unable to conduct the party over the church. The party drove to Priesthaus, where, in the absence of Mr. Alexander Campbell, Mrs. Campbell with the assistance of Mr. Norman Innes and Mr. Edwards, entertained a number of the visitors to tea, the remainder being similarly entertained at Glynleigh by Mr. and Mrs. Cunliffe Smith. Mr. Johnston gave a brief address on the latter house which, he said, dated back from the sixteenth century, the only unusual feature being the turrets, the upper parts of which, it was suggested, may have been used as "priestholes" in the days of Queen Elizabeth and the Stuarts. The last object which attracted the attention of the party was an apparently dilapidated outbuilding of a farm at Otham which, however, proved to be the remains of a chapel of the period 1290-1310. It was built, Mr. Johnston explained, by the Premonstratensian canons, who decided to found a house in Sussex, but found the place so unhealthy that they decided to abandon it and moved to Bayham, where they built the well-known abbey. From Otham the party drove to Polegate station, where they took train to their various destinations.

### CARNEGIE LIBRARY, BIRKENHEAD.

SOUTH BRANCH CARNEGIE LIBRARY (ROCK FERRY), BIRKENHEAD.

[J. R. Newton, Architect.]

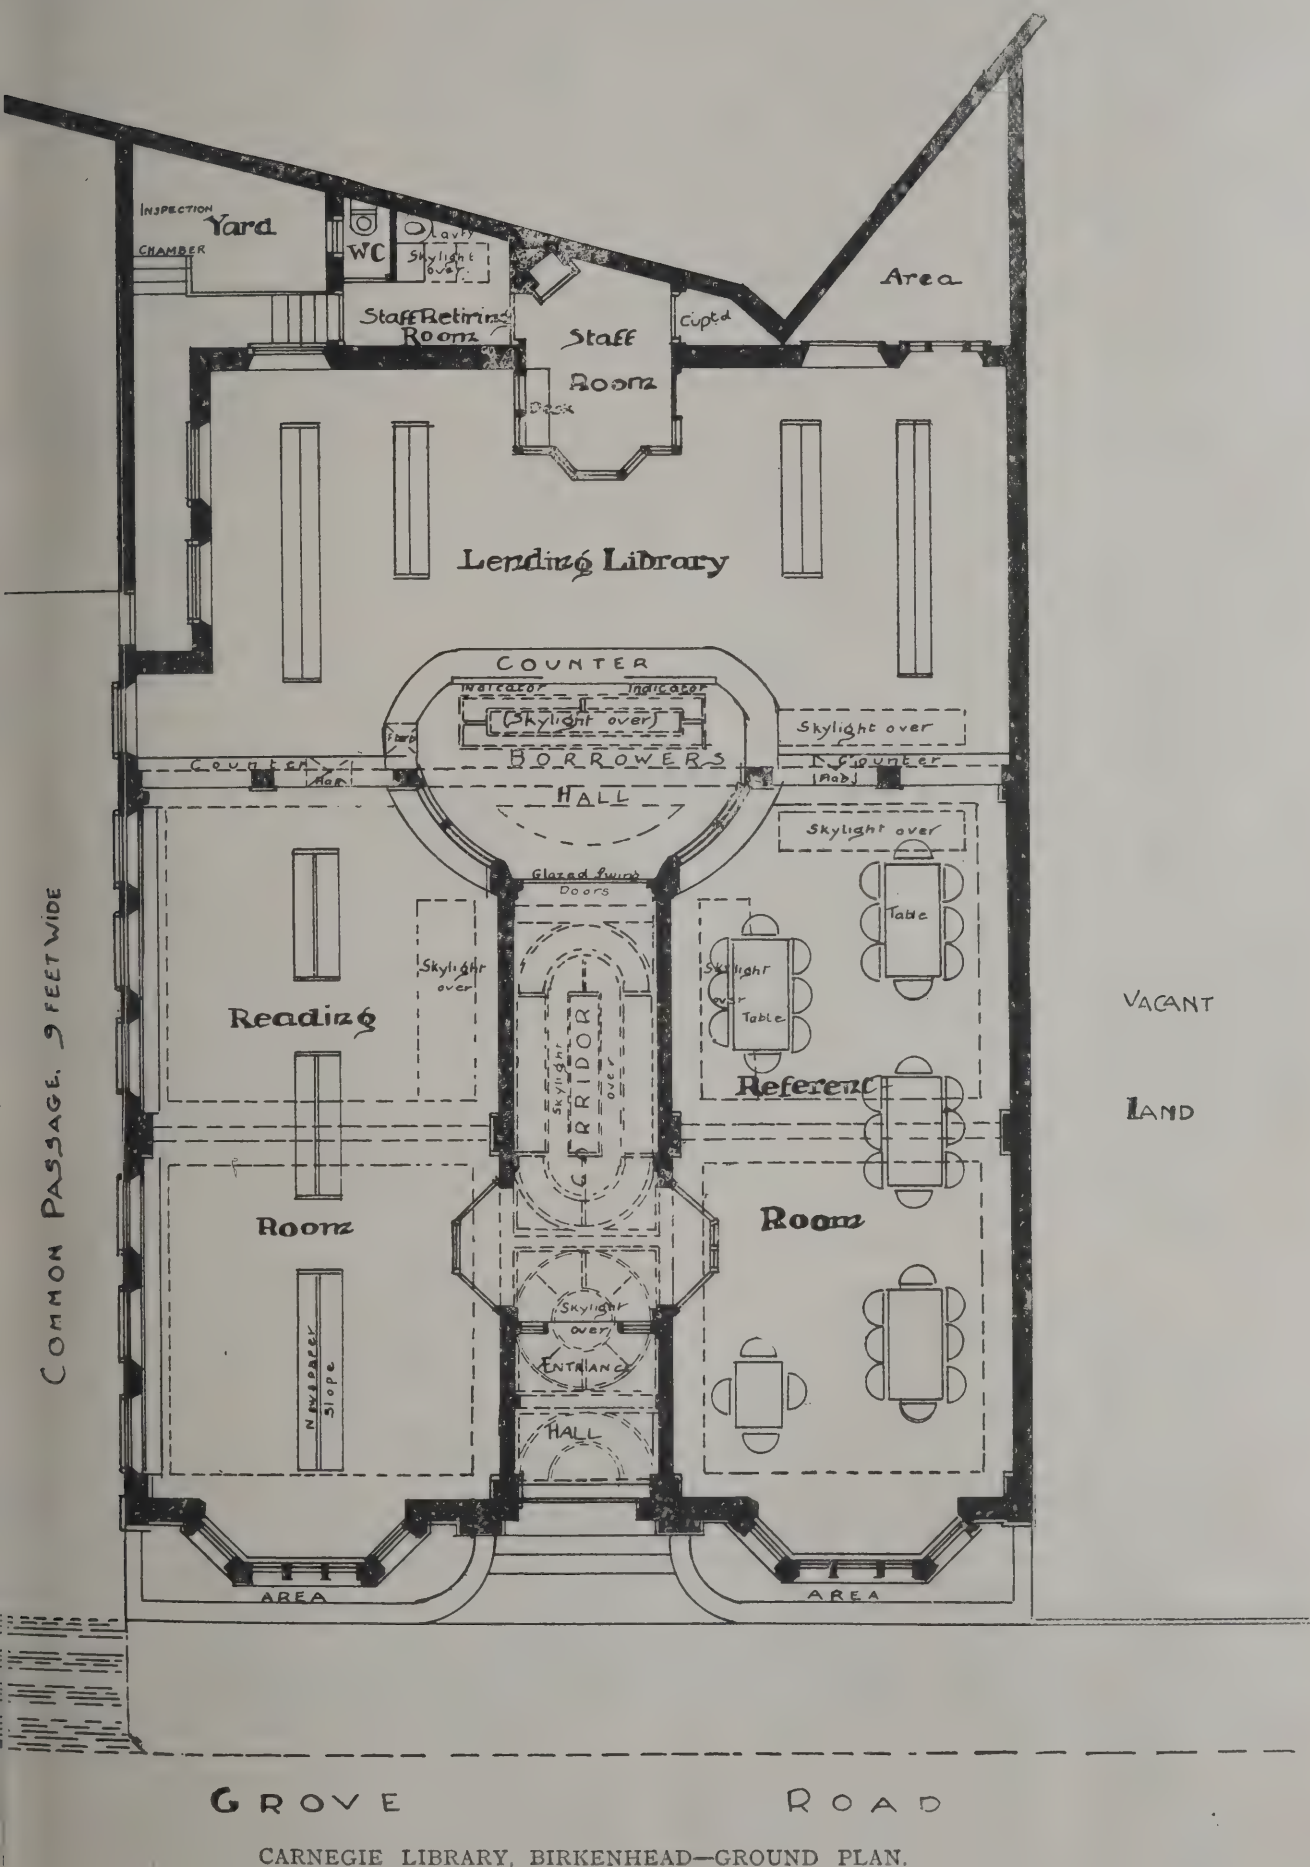

THIS building is to be erected on the site of the present library in Grove Road, but the area of the site will be as large again, additional land having been purchased for this purpose. The entrance is to be in the centre of the Grove Road front. It will be observed from the plan that there is no light upon one side, and only such as can be obtained from a passage on the other side. The two rooms—reading and reference—are therefore arranged at each side of the central corridor, with bay windows, so as to obtain the maximum amount of diffused light from the front.

The light thus obtained would not be sufficient to light the whole room, and roof lights have therefore been employed. Another consideration of great importance is the supervision of the entire building by one assistant; the lending department is consequently placed at the rear, while the staff-room is in the centre. A glance at the plan will show that the assistant at the counter or his desk can have the fullest supervision of each room without leaving his place. The reading standards and tables are placed longitudinally, to facilitate this supervision.

the borrowers' hall is to have a domed roof, glazed with leaded lights, and the entrance corridor will have decorated plaster ceiling with leaded lights let in as is. The whole of the joinery will be of hardwood stained and polished, and the floors will be laid with maple in pattern. The exterior of the building will be built with white stone and red Ruabon brick, with West-

morland green slates for the roof. The style chosen is French Renaissance, bay windows being used in the reading and reference-rooms so as to obtain the maximum amount of light from all directions. The entire building will be heated with hot water on the low-pressure system, and each room is to be separately ventilated. The architect is Mr. J. R. Mewton, 59 Hamilton Square, Birkenhead.

## BURNTISLAND CHURCH.

ON Sunday next the parish church of Burntisland, in Fife, will be reopened after renovation and decoration. Historically and architecturally the building is interesting. It was built in 1592-4, as the successor of the Catholic church at Kirkton, which dated from the year 1234. It is a square building with a four-sided tower and octagonal belfry rising from the converging lines of its roof. The style of its architecture is Dutch, there being in those times considerable intercourse between the Low Countries and the Fife coast. Its design is unique in Scotland, and it is said to be an exact reproduction of a church standing to this day in Amsterdam. Prominent Dutch artists decorated the panels of the gallery with pictures characteristic of Holland. Like many other ancient ecclesiastical edifices its interior has suffered at the hands of ignorant though possibly well-meaning decorators. Its massive masonry pillars, with the stone arches which spring from them to support the roof were treated to successive coats of paper and paint until they looked positively unsightly, and the beautiful panel paintings were hidden beneath layers of paint. Recently a movement was started to restore the interior to something like its original aspect. The pillars and arches have now been cleaned and the masonry laid bare. Under the direction of Sir Rowand Anderson a scheme of decorative panelling in Italian style has been applied to the ceiling, which bears in the four largest panels an epitome of the church's history, thus:—1234, Erection of old church at Kirkton; 1592-4, erection of present Burgh Church; 1601, Bible translation proposed at Assembly presided over by James VI.; 1907, Burgh Church renovated. One of the panels in the front of the gallery has been cleaned, showing a picture of a Dutch galley, from whose broadsides cannon are seen protruding. It is believed that with care the whole of the pictures could be restored to their original beauty, but there are no funds with which to carry on the work, which is to be left in abeyance meantime.

In 1601 there was held in the church a General Assembly of the Scottish Reformed Church. At that assembly King James VI. was present, along with all the leaders of the church, including Andrew Melville. King James VI.'s seat, built of oak, with diamond-shaped panelling, and partly encircling one of the pillars, still stands. It is now used as the seat for the town councillors when they are "kirked." At the same assembly there was introduced the first public proposal for the translation of the Bible. The translation was agreed to. Eighteen months later King James went to England, where he got the English bishops to make the translation, instead of the Scottish churchmen. Ten years afterwards, as the result of that assembly decree, the Authorised Version as we now have it was published. Charles I., born in Dunfermline Palace, has also visited the church, which has seated Oliver Cromwell, Archbishop Laud and other dignitaries of Church and State. Mr. T. A. Wallace, town clerk of Burntisland, is defraying the cost of restoring the pillars and arches, the congregation being at the expense of the decorative work, the total outlay being fully 600*l*.

## GENERAL.

The Rev. Canon Rupert H. Morris, D.D., F.S.A., has been appointed editor of "The Archæologia Cambrensis," in place of the late Mr. Romilly Allen.

Mr. Atholl Macgregor, Ardchoyle, has given a sum of money, amounting to nearly 2,000*l*., towards the building of a lady chapel at the east end of Perth Cathedral, to be designed by Mr. Pearson. Some further offers of money are announced, to be used towards the completion of the west end. A sub-committee of the Chapter has been appointed to consider and report upon the whole question.

The Late Mr. George Allen, who during several years was the publisher of Ruskin's books, was originally a carpenter. But as he showed some skill in drawing at the Working Men's College he was taught by Ruskin to etch and engrave. He helped to catalogue the Turner drawings. Afterwards it was settled that all the business arrangements for the production and disposal of Ruskin's books should be entrusted to him.

A Maison de Retraite for French artists (painters and sculptors) is in course of erection at Montlignon, from the designs of M. Nénot. The whole of the cost is borne by Madame Jules Comte. There will be not only residences, but ateliers for the use of the inmates.

Mr. W. Laurier has published a comely volume, "The Cathedrals and Churches of Northern Italy," by Mr. T. Francis Bumpus. The book contains eighty plates, many of them in colour, and a coloured frontispiece by Griggs. Among the numerous cathedrals and churches described are those of Verona, Vicenza, Padua, Ferrara, Bologna, Ravenna, Modena, Piacenza, Bergamo, Milan, Pavia, Asti, Vercelli, Novara and Turin.

The Petition "to erect halls, &c., at Saughton Place" for the Scottish National Exhibition of Industry, Science and Art came up at Edinburgh Dean of Guild Court on Tuesday inst. Lord Dean of Guild Wilson, who presided, said the Court were prepared to grant a warrant, but they did not like to see that all the "principals" were bolted and nailed. This undertaking was given, and the plan passed.

The Restoration of Holyrood Chapel remains undecided. It is understood that the St. Andrew Society have been moving in the matter, and that a committee of a certain nature have taken certain steps. A memorial, it is believed, has been forwarded to the trustees, Sir John S. Maxwell and Lord Balcarras, enjoining them to advise His Majesty on the subject; and this request is supported by the opinion of architects and builders in Edinburgh. They do not accept the ruling of the gentleman called in as trustees. The memorial is signed by the Earl of St. Andrews, honorary president of the Society. It is possible the question may become a legal one.

The Rev. J. Still, rector of Ketteringham, asked the Norwich Consistory Court on Tuesday, for a faculty to allow somewhat extensive repairs to his church. "The rector said, 'was in a bad condition, and a new one must be provided; the walls would have to be underpinned, the large buttresses at the east end would have to be taken down and rebuilt, and other work would have to be done.' The court would involve the removal of a monument to Sir William Peach, to which the family raise no objection. The entire cost (about 1,500*l*.) would be defrayed by the heirs of the Boileau family. Citation was issued.

The Dundee Presbytery have adopted the following resolution:—"That in view of the Town Council's request, the clerk be instructed to communicate to the Kirk Session Mr. Chalmers's report and the correspondence between the Presbytery and the Town Council, with the recommendation (1) to accept the Town Council's offer to restore the church in the manner proposed by them, believing that what might be preferable to have the Steeple Church rebuilt suggested by Mr. Chalmers, it is at present inexpedient to press for such a scheme, and that the repairs proposed be made upon that church would be sufficient for many years to come; and (2) to satisfy themselves as to the cost and specification of the whole work, and to see to its being carried through with all convenient speed."

At a Special Meeting of Lockerbie Town Council on Saturday, Mr. W. Cuthbertson, Lauriston Place, Edinburgh, was appointed burgh surveyor in room of Mr. W. Stewart, who has received a similar appointment at Ayr. There were seventy-five applications.

A Manchester Merchant who died recently has bequeathed to the Northern Counties Supplementary Hospital for Chronic and Incurable Diseases all his water-colour drawings, pen-and-ink sketches, etchings and engravings, with the request that they be hung around the wards so that they may give some pleasure to the inmates.

An Edinburgh Sculptor is of opinion that a good likeness of Mr. Carnegie, which he is in a position to supply, should be welcomed by library directors "who wish to give Mr. Carnegie the recognition he is so justly entitled to for his generous gifts to their respective cities, and thus to preserve the present and future generations that will visit the Carnegie libraries 'to store their minds with noble thoughts by looking upon a correct likeness of the great philanthropist.'" Dunfermline Town Council has established a precedent by declining to take action in the matter.

The Stockport Town Council have appointed a sub-committee to deal with the question of unhealthy areas, and to carry into effect the powers obtained under the Housing of the Working Classes Acts. The medical officer of health of the borough recently reported that there were over 100 closed-in courts in the town. Dr. Smeeth, the chairman of the health committee, said that the infant mortality in Stockport was 186 per 1,000, as compared with 144 in London, 144 in Bradford and 155 in Birmingham.

# The Architect.

## THE WEEK.

has lately been made known through documentary evidence that BUFFON, the author of the Natural History, during a period of twelve years an amateur iron-master. On his estate he found iron, and in 1768 he commenced to erect works. The furnaces and other works were made of slag-bricks. His principal forge was circular on plan, although the experience of that time was in favour of a square building. The Government inspector of the time reported that BUFFON had produced malleable iron of excellent quality and some also. The ironworks were not profitable to the proprietor. He expended 300,000 livres upon them and conducted the works during twelve years, but he had to abandon them in order to avoid increasing his loss. His experience enabled him to write a chapter on iron. He had received any encouragement from the Government but it is not unlikely that many modern improvements would have been anticipated. But he found, on the contrary, that the State derived more benefit from his ironworks than the owner.

It appears that in the offices of the Ministers in Paris there are numerous pieces of furniture which possess unusual historic or artistic interest. Ministers come and go so quickly in France, there is the risk that those works will not receive uniform treatment. The Société des Amis du Louvre, of which several wealthy and generous amateurs are members, consider that the furniture should be deposited in the museum. For that purpose they have offered a large sum of money to enable the pieces to be reproduced—originals afterwards being placed in the Louvre. As large as is the building, it will be difficult to find room for the additions, and it may be necessary to remove objects of inferior importance or which have become too familiar to be interesting. It may be mentioned in connection with the Louvre that *POUSSIN'S Deluge* has been satisfactorily restored by M. DENIZARD, and that the trace of the lacerations is to be discerned.

If the forthcoming Franco-British Exhibition in London, from which so much is anticipated on both sides of the Channel, is to be a success there must be harmony among those who have voices in the arrangement. It is therefore to be regretted that M. RODIN, sculptor, should have already resigned his membership of the committee. Of late years he has often visited London and taken part in various exhibitions, but it may consequently be supposed in France that his presence in this country is unlimited. Various speculations have arisen about the cause of the resignation. It is allowable for men to imagine that because M. RODIN is an innovator he cannot approve of the importance of works which were produced according to traditional methods. The committee desire that all types of French art should be exhibited, and that national as well as independent ideas should be brought under the eyes of visitors to the exhibition. It is only in England that French art has to be displayed, and the committee of which M. RODIN was a member intend in course of time to realise that vast task.

Among the 1,381 students at the evening classes of the Sheffield Technical School there are 163 who are counted as "architects and building trades." Next to engineers, turners, fitters and pattern-makers form the largest section. Among the students who have passed through the civil engineering courses are registered as "architects' assistants." It has been found that several of the students attending the classes are drawn from the ranks of assistant engineers, and pupils on railways and waterworks, assistant

engineers and assistant surveyors to corporations, urban and rural district councils, building and sanitary inspectors, &c. Formerly such students had to rely for their professional equipment on what they could learn during their articles, and from the practice of a single principal. In Sheffield metallurgy occupies the foremost place on account of its connection with the industries of the city. It has now been practically conceded that in connection with the Imperial College of Science at South Kensington, Sheffield is to be taken as the national centre for the study of steel metallurgy.

THE Eiffel Tower in Paris seems to be destined to serve for experiments in colour. Originally it was painted in orange. Four years afterwards red was preferred and endured for six years. In 1899 it received a coating of golden yellow. The law about painting exterior works every three years is not applicable to structures in the clear air of Paris, for the appearance of the structure has remained unchanged during eight years. For the first time it has been resolved to try the effect of two colours. From the base to the third platform ferro-brun will be applied. It consists of an oxide of iron with chrome yellow. From the third platform and upwards silver white will be employed. The painting is expected to occupy three months and will cost 3,000*l*.

THE late Professor L. F. VERNON-HARCOURT, who died on Saturday in his sixty-eighth year, had a wide reputation as a consulting engineer. A glance at his book, "Achievements in Engineering during the last Half-Century," is almost enough to suggest the wide range of his knowledge and interest in all branches of his profession. After an University education he became a pupil of the late Sir JOHN HAWKSHAW. In his office there was a possibility of acquiring a knowledge of every kind of engineering construction; and Mr. VERNON-HARCOURT by accident, or preference, became connected with harbour and dock works. In 1882 he received the appointment of Professor of Civil Engineering at University College, London, which he held for over twenty years. He wrote books on harbours and docks, rivers and canals, water supply and other subjects. He was a member of the Suez Canal Works Commission, represented this country at the Navigation Congress at Milan, and served upon the international jury upon canal lifts. He was proud of his profession, and he said that "if engineers in the future continue, as in the last half-century, increasing and extending the benefits resulting from their works, they will justly be regarded as ranking among the greatest benefactors of mankind."

THE auditors of the Local Government Boards of England and Ireland now appear to scrutinise the accounts of the local authorities in a more microscopic fashion than formerly. The Dublin Corporation will have to submit to several surcharges. Under the Libraries Act the amount is 1,767*l*. One of the building surveyors of the Corporation was suspended for negligence without pay, but he received 144*l*, which is another surcharge. The waterworks committee had an outing, and the expense connected with it has been surcharged. An association acted as an examining body, but under the Libraries Act teaching only is recognised, and the amount was disallowed. The question is, "How are the surcharges to be met?" Some of the members of corporations and borough authorities are working men, and their tenure of office often involves loss to them. If responsibility for outlay about which opinions differ is to fall on individual members very few will be ambitious of the office. In Dublin it appears the salary and allowances made to the Lord Mayor, amounting to 2,455*l*, are illegal. Works committees have in most places control of the largest proportion of the expenditure, and it becomes a serious consideration should any of their acts be questioned by an auditor.

## GHEERAERTISING BRUGES.

By JOHN A. RANDOLPH.

WHAT may be called the Gheeraertising of Bruges is going on apace in that fascinating city. We have deliberately coined the word, as it explains fully the objects of the "powers that be" in Bruges and of private residents fortunate enough to own ancient houses there of any pretensions, whether of Gothic or Renaissance style, for the restorations—at least those of public buildings—are based on the old "Bird's-Eye View Map of Bruges," by MARC GHEERAERT, discovered at Lübeck (above all places) some years back by Mr. WEALE.

The new front of the Governor's residence on the Grand' Place, though fine in its unfinished state, with the Post Office alongside, is probably not based on the plan above referred to, and we think the Post Office building loses somewhat in character by the too uniform and deep colour of its brick and by the blue limestone employed for the windows and dressings, the more so as it contrasts rather unfavourably with the white stone building of the Palace; but perhaps when the whole of that front is at length finished—evidently not in this generation—the other corner will be constructed to match. Tenders were issued last month for the reconstruction of the Rue Breydel portion towards the Bourg, and it was about time, for the shallow houses and shops there had been pulled down about five years, and nothing done to make the place presentable. The prospect of visitors from all parts for the "historic week" and the exhibition of the Golden Fleece evidently roused the authorities, lest they should get a bad reputation for their slowness in carrying out much-needed public work. If they had simply taken the pains to erect a tidy and high hoarding in front of the "venerable ruins" in that thoroughfare, and paid attention to the completion of the Grand' Place front during those five years, there would have been "no complaints," but only half that side has been completed since the disastrous fire there in 1878.

In the public works line Ghent can give Bruges a very long start—and a handsome beating into the bargain.

Among the restorations of public buildings, though the intention is good, we regret to see history wiped out by the restorer with a view to bringing them into line with MARC GHEERAERT. Alongside the church of Notre-Dame, for instance, is the Gruythuis, once a charming town residence of a great Bruges family, with a triangular roof till the restorer came on the scene and erected over it, on shafts, another roof—a little more pointed—with a pierced parapet round its base and a diminutive staircase turret, to bring it back to its incongruous aspect of 1562. The main building, too, has been somewhat meddled with to secure uniformity, and the structure is now seen from the roadway, some wretched little hovels having been swept away that hid it from view; but they had nice little gables, and made a picturesque bottle-neck approach to the Dijver.

On the Dijver, nearly facing the Nepomucene bridge, a curious excrescence on a corner house front has been stuck on, and it is supported, over the pavement, by a couple of columns *en guise d'arcade*. The effect is more quaint than pleasing.

The west front of Notre-Dame Church is being rebuilt entirely (and set back a few feet), they say, from the original design. The entrance to the Rue Ste Cathérine and the approaches of the Hôpital St. Jean will gain a few feet in consequence. A railing has been put alongside the north aisle of the church between awful examples of stone columns.

At the hospital some very good restoration work has recently been effected, but the work was not quite complete in July, and apparently it is intended to wait some time before finishing the undertaking.

The pictures have been removed from the Académie to the Musée des Beaux-Arts at the École Bogaerde, and the space available seems inadequate; but the Académie has been practically rebuilt during the last few years, and is only half its former width on the Place Jean Van Eyck. In the last year or two, likewise, the elegant slightly curved equilateral roof to the delightful turret has given place to a pierced parapet and a disappointing two-stage flèche with apparently heavy detail. We must confess to unmixed disgust at this uncalled-for spoiling of such a (formerly) charming structure, whether it has been Gheeraerted or not. The Académie is totally unrecognisable from what it was before it was touched by the restorer. In the Rue de l'Académie alongside, the huge brick gable, practically a modern affair, will shortly give way to an extension of the building, as the whole of its interior has been demolished.

St. Jacques's Church front has been restored and the parvis opened out, partly at the expense of the garden of the Hôtel du Commerce, and St. Giles's Church sacristy has been pulled down and a Gothic brick one erected. The fine central shaft and vaulting of the old sacristy disappeared with the rest. That church, too, has been "restored."

Of the houses now being refronted in many places in the town we can speak with greater satisfaction, and we congratulate the authorities on their decision to insist on the preservation of the old bricks from demolished old houses for use in the new fronts, as their durability is undoubted and their colouring of the beautiful half-pink half-yellow tint; and white stone dressings are being more used than formerly, to greater artistic advantage.

Equally destructive as to the Académie has been the unfortunate transformation of the once charming Gildes Arquebusiers of St. Sébastien, near the Rampart. The long building, with stepped gables at the ends and a delightful turret, has been completely transformed—its detriment—with the addition of a "pavilion" style body stuck on one of its fronts, a toy corner turret at each end of the main body, and the singularly happy main turret uncharacterised and rendered finikin and thin—altogether a most miserable and mischievous transformation, which ought not to have been tolerated by the most ardent admirer of MARC GHEERAERT and the artistically inclined Brugeois.

It is devoutly to be hoped no sacrilegious hands will be laid on the glorious belfry—the noblest tower of its kind; but really, after what we have seen here in the way of history-destroying restorations, one fears the worst may yet come to pass.

Of the new Bruges that is arising, we are optimistic though some Ostendish houses disfigure the neighbourhood of the entrance to the Rue d'Ostende. However, a very fine Bruges-style house has been erected at the corner of that entrance, facing the Rue d'Ostende, chiefly of old bricks.

Some of the buildings of the new Installation Maritimes are also in the old style, but there is, unfortunately, a sprinkling of the very reverse among them.

Passing, favourable mention may be made of a new turreted house by the Minne-Water, and of the model Béguinage, while the restoration of the "Potéris" chapel front and adjacent seven gables is pleasing.

Mr. T. E. Collett has been appointed consulting architect to the Manchester Corporation on the subject of the possibility of adapting the old Infirmary buildings for uses as a reference library, art gallery and municipal offices. The special committee had previously passed the following resolution:—"That the consideration of the reports of the special committee *re* Royal Infirmary site be deferred, while the object of securing an opinion from an absolutely disinterested architect free from local circumstances, who is to be commissioned to report upon the possible adaptability of the Royal Infirmary buildings to the purposes of a reference library, art gallery and municipal offices."

# THE GOTHIC OF NORTHERN ITALY.\*

THE volume on Italian churches by Mr. FRANCIS BUMPUS represents seven weeks of travel. As readers are aware, he already has written about abbeys and churches in England and Wales, France and Germany, all of which are allied in different ways. From his acquaintance with Gothic he was cognisant of the majority of examples of the style in Italy and a little of that inspiration which created the Norman buildings, and he therefore hesitated before accepting the publisher's offer to write about Italian churches.

The volume displays the characteristics of the author. English painters who took subjects from architecture, and are now almost extinct as a race—WYKE BAYLISS was the last of them—in representing foreign churches have felt that architecture by itself can appear to be more than the men who created it, and accordingly took care to introduce worshippers in various poses, as if to suggest the subserviency of the great arts to other interests. They were not always successful in recording ceremonies; DAVID ROBERTS, especially, followed a ritual of his own, which was very grandiose. Mr. BUMPUS in his treatment is suggestive of ROBERTS, PROUT, WILD, READ, HAIG and other painters than of the ordinary architectural draftsman. He does not care for empty churches. He has a fellow-feeling for mortals in their endeavour to worship; and his churches are therefore not the mere skeletons of the guide-books or the skeletons of architectural anatomists, but the shrines in which humanity is at once most humble and most exalted. His sense of scale is not determined by the proportion of the part to the whole, but by the relative importance of the parts. There is consequently an expression of sympathy when he has to describe a building which suggests infinity by its greatness as compared with the men who bend in devotion within it. For instance, describing Milan Cathedral, he says:—

There was an immense concourse of people present, there was no impression of a crowd. The church was so long, not even full; there still seemed room for a multitude to come in. In ordinary buildings when they are filled to their utmost capacity the architecture disappears, the mind and eye are occupied only with the men and the architecture. "But the Duomo at Milan can never be thus put to rest. Fill it full of human life, it would still be some-thing greater than them all. Men, however numerous they may be, would be but appendages to its mountainous mass. As the sky is more than the stars, and the wooded hills more than the trees, so is Milan Cathedral more than the amount of humanity that can be gathered within its walls."

Mr. BUMPUS was rewarded for his sympathy by being able to witness a greater variety of ceremonies than fall in the way of ordinary travellers during a longer period. At Ratisbon he was present at the ordination, the ceremonies commencing at eight o'clock in the morning. The hymns were sung in a style which suggested a combination of mediævalism and modernity. The impression made on him is expressed in his own words, and they deserve to be recorded not only as indicating the power of sound, but as enabling us to understand the spirit in which Mr. Bumpus sets about describing church buildings. He is not a critic who like an Indian after scalps seeks out faults in order to demonstrate his superiority, but a man who is not ashamed of his emotions, for he knows that the touch of nature or art can make us all akin:—

The conclusion of every piece a silence like that of a bell upon the church, as if some celestial vision had been before the living eyes and hushed into stillness the pulse of human feeling. The effect of this invisible was beyond anything I have ever heard or ever

expect to hear. The air seemed stirred with the trembling of angelic wings, or as if the gates of heaven had been opened and a wandering breath from the songs of seraphs had been borne to earth. A few sounds which, under ordinary circumstances, would have been merely a passing luxury to the ear, heard on this solemn occasion and beneath a noble vault, were like a purifying wave, which, for an instant, swept over the soul, bearing away with it all the soil and stains of earth, and leaving it pure as infancy. There was, it is true, a reflux tide; and the world, displaced by the solemn strain, came back with the echo; but, though we cannot keep the heights we are competent to gain, we are the better for the too brief exaltation.

Professor FREEMAN considered it was wise for the student of architecture to enter Italy from Germany, and to begin with Trent. It may be said that Mr. BUMPUS follows that route, although he has some remarks on churches at Vagara, Bergamo and others of the north. He felt the surprise of most architects when, on entering the Trent Duomo, he found before his eyes a building which recalled some of those he had seen in Germany and France. It is wonderfully suggestive of Norman work, and at the same time the piers appear to be lighter than was usual in that style. It is no wonder Mr. BUMPUS says he was fascinated by it. At Verona it was not long before he visited the Campanile. He offers some interesting remarks on those structures. Only under special circumstances would he recommend the adoption of the tower in England. He says:—"Let the portraiture of the campanile be by all means transferred to the sketch-book, but do not let the more substantial image of it be attempted elsewhere in England than in a town. With what success this has been achieved those who know the early pointed campanile of St. James the Less in Upper Garden Street and the neighbouring Byzantine one of the Roman Cathedral at Westminster are able to judge." He was attracted by the fine limestone of Verona, which has been called *bronzino* from its metallic sound when struck. He also refers to some of the architects which the city produced. One was FRA GIACONDO, who was once described as an old and new library of all that was good in science. Like other clever men, he seems to have wandered from city to city, and appears to have been royal architect in Paris. SAN MICHELE was likewise a native of Verona, and it is believed his portrait was introduced by TITIAN in *The Assumption*. Mr. BUMPUS witnessed the ceremony of confirmation in the cathedral, which differed from the customary practice, for instead of the children being arranged at the altar rails they were placed in files along the nave, and the bishop confirmed them all standing. Besides the cathedral he finds much to admire in the churches of Sta Anastasia, St. Peter and St. Zeno. The last he considers to be the grandest specimen of the Lombardo-Romanesque basilica in existence. Concerning the brickwork of North Italy, Mr. BUMPUS remarks:—

Important as is the brickwork of Northern Germany, upon which I have dwelt at some length in my volume on the architecture of that country ("The Cathedrals and Churches of the Rhine and North Germany"), it cannot be compared in general artistic interest with that of the North of Italy. Much as there is to find fault with in the construction and general system of design of the Italian buildings of the Middle Ages, it would be idle to deny to them those highest merits which mark the work of civilised, delicate and refined artists. German architecture, after the end of the thirteenth century, was uninteresting and unrefined beyond that of any other country, and the ascending scale would take us from it through England and Spain and the North of France, on to the greatest perfection which was reached in some of their works by the best Italian artists. In saying this I by no means give the palm to the Italian artist, far from it. But his work has certain tender graces, especially in its detail, which has never been surpassed; though at the same time no English architect is wise who proceeds, as so many have done, to study it without first of all having studied, to such an extent as to be thoroughly penetrated with, the spirit of the inimitable old

*The Cathedrals and Churches of Northern Italy.* By Francis Bumpus. With eighty-one illustrations (nine of which in colour). (London: T. Werner Laurie.)

churches of his own country. There is some charming brickwork in the fourteenth-century Gothic church of St. Fermo Maggiore, close to the Ponto Navi, but it displays one of those features of sham construction to which I have drawn attention both in Italy and in Germany, *i.e.* the screen wall carried up high above the roofs, but of no possible use.

It is not to be expected that an enthusiast for Gothic can enjoy the work of PALLADIO, which for most architects is the chief attraction of Vicenza. Mr. BUMPUS, however, avoids sneering at what appears to be mere flimsiness of construction, better adapted for stage purposes than for ordinary use. But he considers that "every candid critic must admit how inferior in interest and association are his artificial compositions to the sometimes less artistic but genuine and durable erections which the Italian Mediæval architects, supplying the wants of their day with the materials nearest to hand, have left as illustrations of brick and marble in the Middle Ages." He finds metal more attractive in the severe old cathedral and in the church of St. Lorenzo. In Padua the paintings of GIORIO and other early artists allure many visitors from bestowing attention on the architecture. Yet there is no place which is more of a demonstration of the failure of an excess of wall decoration than Padua. Mr. BUMPUS, like other travellers, was subjected to the reaction which seems to be inevitable when eyes are wearied with pictures without intervening spaces, for he cannot conceal his admiration for the interior of Sta Giustina, although it is of an almost commonplace type of Italian Renaissance. The building might easily be considered as especially favoured, for time seems to have little effect upon it.

The first impression which Venice makes on a traveller is one of those exquisite pleasures which, unfortunately, are not to be repeated. It is very difficult to avoid echoing what many others have said when one is endeavouring to describe such an interior as St. Mark's. "The first impression conveyed," says Mr. BUMPUS, "is that of a cavern of gold encrusted with precious stones which are at once splendid and sombre, sparkling and mysterious. Cupolas, vaults, architraves and walls are carved with little cubes of gilt capitals of unique form, among which the rays of light sparkle like the scales of a fish. Where the gold ground terminates at the height of the columns, commences a clothing of the most precious varied marbles, porphyries and alabaster, relieved by pure white marble, sculptured in panels, string-courses and the like. The various marbles are arranged in broad upright bands, alternating so that one colour enhances the effect of the one next to it." The majority of the churches of Venice are examples of Renaissance architecture, and have been often described. Mr. BUMPUS therefore is content to allow St. Mark's to be the sole representative of Venice in his pages.

The cathedral of Ferrara was an early victim of restoration, and the contrast between the west front and the interior is almost suggestive of two different buildings. From examination of an old engraving Mr. BUMPUS arrived at the conclusion that in the seventeenth century the cathedral "had its several great vaulting bays subdivided into two lesser ones supporting a triforium, comprising two triple arcades under semi-circular arches, and a clerestory curiously lighted by two tiers of very small round-headed windows." Now it presents quite another appearance. But as long as the west front is respected the cathedral must be considered as one of the few satisfactory examples of Italian Gothic. In describing Bologna Mr. BUMPUS offers remarks on the planning of Dominican churches with their wide naves. He also gives a photograph of the restored reredos of St. Francesco. The church was suppressed and used as a Custom-house; in 1866 it was again secularised, but once more it serves as a church. The great church of St. Petronio, which at one time took precedence of the cathedral, has been for several years a subject of litigation. In 1857 the POPE, to

whom Bologna was subject, offered 13,560*l.* to completing one of the façades. The money was paid. When the Italian Government took possession of the old city the Government refused to receive any obligation to realise the papal offer. After spent at law it has been decided that the Government is liable not only for the 13,560*l.*, but for interest. The result suggests the independence of the judges. Considering the modern price for such work such a sum is inadequate. MICHELANGELO in his young days willingly accepted twelve hundred ducats for one of the kneeling angels on the tomb of St. DOMINIC, and for the statue which surmounts it was paid only eighteen ducats. But able sculptors are no longer to be found in Italy who are ready to work on similar terms.

Ravenna is described at some length, for although it may not present many Gothic buildings, those of the date are remarkable, especially to lovers of rhythm. It is rich in basilicas. Thus to Mr. BUMPUS the memory of Sta Agatha recalls BUTTERFIELD'S porch in St. Matthias, Stoke Newington, and at St. Andrew's Holborn. From Ravenna Mr. BUMPUS passed to Lombardy, where architecture of a different form awaits the traveller. At the present time England appears ripe for a change in the style of church building. Mr. BUMPUS, like a great many other students in England, is eager to see experiments in Italian Romanesque variety which the late Professor E. A. FREEMAN first to recommend. But Mr. BUMPUS admits that Romanesque churches are not faultless. "The walls," he says, "are frequently monotonous, interiors are but ill-lighted, in some places others flooded with a glaring light; the distribution of the decorative element is not always happy, pillars and capitals being overcrowded with various patterns, intermingled with empty, unadorned spaces. They impress us too powerfully with the unsettled character of the minds of those who designed them. The character of the religious and the heavy armour of the warrior are to be traced in them." The cathedral of Modena is the first example he describes and it is most remarkable. "La Ghirlandina" he considers to be the loveliest of the campaniles of Northern Italy. The cathedral of Modena is one of the noblest examples of its class, but the architects could not have realised the characteristics of the style when they allowed CORREGGIO to paint the cupola with figures which the Lombards would certainly not tolerate. Modern inquiry has, however, exploded the legend about the payment of the artist in copper, and his death from the effort to carry the starving family; indeed, the character of his work is suggestive of the "Fawn of the Renaissance" having been a happy man. The view of the cathedral of Modena proves that the cathedral authority has not been realised that unadorned Romanesque becomes more effective. Another fine example is St. Michael, Ferrara, in which the sculpture of the west front is unlike anything found in a Christian church. Most of the figures are doubtful orthodoxy, and probably the sculptors were under the influence of a different belief. Less remarkable is the so-called shrine of St. Augustin, which stands in the cathedral, but which is now once more the church of St. Peter. VASARI says it was executed by two Siennese sculptors in the fourteenth century. They must have had a weakness for forgery or a sort of versatility which enabled them to work in a style accepted three centuries earlier, for the number of the figures have a surprising air of belonging to a time preceding that of NICOLAS PISANO. The interior of the cathedral of Pavia reminded Mr. BUMPUS of WREN'S St. Paul's; but WREN was never supposed to have visited Italy. Milan Cathedral forms the contrast to the volume, and to Mr. BUMPUS it becomes much more than a vast building constructed of marble. He says that

While awaiting the commencement of the Divine service within the dusky choir of the Duomo on this beaut

turning, the angels of architecture had many lovely and precious things to tell, and unfolded the inner meanings of arches and arches, roof and windows, lights and shadows. As I listened, every now and then it seemed as if they were telling things that I had always known before, and I felt that the whole building was, as it were, a Sacrament, that every outward and visible form had an inward and spiritual meaning which gave new dignity and power. And when a solemn introductory piece was played upon the organ, I felt that the angels of music too were there as witnesses to the consecration of the beauty of melody and harmony to the service of the temple, and by their presence giving a solemnity and pathos which would not be found in such a degree without them.

From the extracts we have given it will, we hope, be evident that Mr. BUMPUS's book has the great merit of sincerity, for most of his chapters are records of the impressions he received in or before the buildings. It is therefore, unlike the majority of books in which the same subject has been treated, and the pages can be read with pleasure, both by those familiar with Northern Ireland and by those who have yet to make acquaintance with that delightful region. There are a great many photographic illustrations which are very clear, and taken from good points of view. There are also some sketches in colour and a few among them seem suggestive.

### BALTINGLASS ABBEY.

A PAPER on the history of the Cistercian abbey of Baltinglass, co. Wicklow, was read by Lord Walter Russell at the visit to the ruins of the members of the Kildare Archæological Society. His Lordship stated that the original name of Baltinglass was Bealach-dubhthaire, meaning Dubhthaire's road or pass, its present name being a corrupted form of "Bealach Chonglais," or "Cunglass Road," a name which it obtained from a hunting master, which, according to an ancient manuscript called *Dinn-Seanchus*, occurred during the reign of Conary-Mor, monarch of Ireland from B.C. 109 till his death in 140. Cuglass, who was the son of Donn-Des, a king of Leinster, held the position of Master of the Hounds to the monarch Conary-Mor, and on one occasion he proceeded to Tara with the hounds, and seeing a wild boar he set in pursuit of it. The boar, taking a southerly course, was hunted to Bealach-Dubhthaire, where, being hard pressed, it sought refuge in a cave, and with the intention of driving it out, Cuglass and the hounds followed it, but not one of them issued forth again . . . until the year 1140, when the abbey of Baltinglass (or Baltynglass, as the documents more correctly write it) was founded. The mother house in Ireland of the Cistercian Order was the Monastery of Fontenay, which was founded in 1142 by Donough, Chief of Uriel, in Louth, who died in the year 1151. A daughter of Mellifont was Baltinglass Abbey, founded either in 1148 or 1151 by Dermot-na-Gall MacMorris, king of Leinster, whose death occurred at Ferns in 1171. From Baltinglass Abbey sprung four other monasteries—Jerpoint, in co. Kilkenny; Abbeymahon, in co. Cork; Kesh, in co. Kildare; and Abbeyleix, in Queen's County. In 1163 Maelisa O'Laighnain, who had been Abbot of Baltinglass, died Bishop of Emlly. In 1324 Thomas, second Earl of Kildare, received a grant from the Crown of 20% in payment of his expenses for placing a son at Baltinglass and at Dunlavin to resist the inroads of the O'Byrnes, of Ranelagh. In 1375 the Abbot of Baltinglass petitioned the King's Council in Ireland that he should be excused from having to attend Parliaments, explaining that his abbey was dependent upon the Abbot of Kesh, who was accustomed to attend Parliaments and to answer for those abbots dependent upon him. By a Statute of Kilkenny, October 28, he was exonerated from future attendance. In 1380 writs were sent to the Abbot of Baltinglass and to other monasteries enforcing a decree that no Irishmen should be admitted into religious houses situated in the Pale. On June 30, 1541, as Eustace (or FitzEustace), of Harristown, co. Kildare, was granted the site of the abbey of Baltinglass and all its lands and possessions, being at the same time created Lord of Baltinglass. The abbey and its Wicklow possessions eventually came into possession of an officer who rendered much active service under the Crown—Sir Henry Bagenal, Kt. About the year 1617 the abbey posses-

sions passed into the hands of Sir Charles Wilmot, Kt., by a grant of James I. In 1624 they were leased for a thousand years to Sir Thomas Roper in consideration of a sum of 3,000*l.* paid by him to Sir Jas. Carroll. The town of Baltinglass was created a borough in 1663. The castle of Baltinglass stood in a small field adjoining the abbey burial-ground on the south-east side. It was demolished about the year 1882 by the Rev. John Usher, rector of Baltinglass, to supply materials for the building of a glebe-house and new church. During the course of its destruction a cannon ball and the seal of a Papal bull were discovered within the walls, the latter having engraved on it on one side two bearded heads, and over them the initials "S.P.A.," "S.P.E.," and on the other side "Alexander P.P. III." These articles are now in the possession of Mr. J. R. Dagg, of Holdenstown, near Baltinglass.

### WELSH SCHOOLS.

**B**UILDING regulations have been issued by the Board of Education, being the principles to be observed in planning and fitting up new buildings for public elementary schools in Wales. There are some differences from the regulations for English and Scottish schools already issued. The following are extracts:—

#### Section 1.—General.

Before an architect is instructed to prepare plans for a new building for use as a public elementary school, careful consideration should have been given to various points which have an important bearing on the character of the building which is required in the particular case.

The principal factors to be considered are the respective numbers of boys and girls for whom it has been determined that provision is necessary. The distribution of these scholars in respect of age is also very important in its bearing on organisation and consequently on planning; the type of building required will probably depend to some extent on the manner in which the local education authority have exercised their discretion as to the exclusion of children who are under five years of age, and the nature of the accommodation required in the upper departments of ordinary public elementary schools will be affected if higher elementary schools are provided in the locality.

It must be remembered that a head teacher can seldom undertake effectively the responsibility for more than five to six hundred scholars, including the supervision of the teaching staff required for that number. This, therefore, is the greatest number of scholars for whom provision can wisely be made in one and the same department, remembering that each department must have its own head teacher, who is responsible for the general control and supervision of the instruction and discipline of that department (article 8 of the Code).

The number of departments on any one site will depend upon the total number of scholars for whom provision is required, but it will be very seldom that more than three departments (or four, if one of them is for boys and girls of seven to nine or ten years of age) could properly occupy parts of one and the same building. When a school comprising departments for boys, girls and infants is attended by all the children of the area for which it is available, it is not unusual to find that the average attendance in each department is much the same; and this fact will be a guide in planning a building for these conditions. But it is desirable to have a certain margin of places in the infants' department in order to meet the greater variability of the attendance at different seasons.

All these considerations should be kept in mind in deciding how many places should be provided in the several departments of a large school. But in every case the local circumstances must be carefully considered, and if children under five years of age are excluded, or if many of those who reach the age of twelve years are transferred to schools of a higher grade, or if other special circumstances exist, the proportions above suggested must be considerably modified.

The number and circumstances of the scholars who will attend in each department (if more than one be contemplated) and the number and qualifications of the teaching staff to be employed in each, will determine approximately the grouping of the scholars for teaching, the number of rooms which should be provided in the building and the number of places in the several rooms. The rooms must be grouped compactly and conveniently so as to secure proper organisation and supervision; every building in-

tended for use as a public elementary school, must be planned so that the children who will attend can be seated in the best manner for being taught. It is important to remember that the number of places provided in any room depends not merely on its area, but also on the lighting, the shape of the room (especially in relation to the kind of desk proposed), and the position of the doors and fire-places, which should be arranged so as to allow the whole of one side of any room to be left free for the groups of desks.

For large departments containing from 350 to 600 places the most suitable plan is that of a central hall with the classrooms grouped round it; as a rule, such a department would require from seven to ten classrooms. Smaller departments may be planned conveniently with the classrooms opening from a corridor, and a similar plan may be adopted even for larger departments. For small schools a schoolroom with one or more classrooms will be sufficient. There should always be at least one classroom, except in special cases.

Where the site is sufficiently large, open and fairly level, the most economical plan is that in which all the rooms are on the ground floor, and this arrangement is preferable on educational grounds. It is desirable that a building for use as a public elementary school should be on not more than two floors. A building on three floors is open to many objections, though it may be necessary in special circumstances, as, for example, on a site where land is very costly, or where it is otherwise impossible to get adequate area for playgrounds.

#### Section 2.—Central Halls.

When there is a central hall it should have a floor-space of not more than 4 square feet for each scholar for whom the school is recognised; about  $3\frac{1}{2}$  square feet for each scholar will be sufficient. The hall must be fully lighted, warmed and ventilated.

(a) A single central hall may be provided for the joint use at separate times of two departments, provided that it is so placed as to be readily accessible from the classrooms of each department.

(b) Where outdoor space is not available physical training should be given in the central hall or corridor. This purpose should be taken into consideration at the time when the building is planned. Since fixed gymnastic apparatus is unsuitable for children under fourteen years of age, a separate gymnasium is not required and cannot be approved.

#### Section 3.—Corridors.

Large schools not built with a central hall must be provided with a wide corridor giving access to the rooms; and two or three of the rooms ought to be divided from one another by movable partitions only, so that on occasions one large room may be available.

A corridor should be fully and directly lighted and ventilated, and from 8 to 12 feet wide, according to the size of the school.

#### Section 4.—Schoolrooms.

Where a schoolroom is the principal room in a school which has neither central hall nor corridor it should never be designed for more than 100 children, and a room of even smaller size is desirable. The width should vary according to the kind and arrangement of the desks.

No schoolroom lighted from one side only can be approved. The gable end should be fully utilised for windows, and there should be no superfluous windows opposite the teacher.

When a school consists of a single room, that room should not contain more than 600 square feet of floor-space.

#### Section 5.—Classrooms.

The number of classrooms should be sufficient for the size and circumstances of the school.

(a) The classrooms should not be passage-rooms from one part of the building to another, nor from the schoolrooms to the playground or yard. Both schoolrooms and classrooms must have independent entrances. The rooms should be arranged so that each can be easily cleared without disturbing the work proceeding in any other room.

(b) A classroom should not be planned to accommodate more than from fifty to sixty children, but in special cases somewhat larger rooms may be approved. In the absence of supplementary light the measurement from the window-wall in a room 14 feet high should not exceed 24 feet 8 inches. Except in very small schools classrooms should not be planned for less than twenty-four scholars.

(c) The proportions of classrooms should vary with kind and arrangement of the desks; but a long and narrow room should always be avoided, and a room approximating to a square is most satisfactory.

#### Section 6.—Desks.

Seats and desks should be provided for all the children, graduated according to their ages and placed at right angles to the window-wall. The seats should be fitted with writing-tables.

An allowance of 18 inches per scholar at each desk seat will suffice except in the case of the dual desk, the length of each group should therefore be some 18 feet of 18 inches, with gangways of 18 inches between groups and at the walls. In the case of the dual desk the usual length is 3 feet 4 inches and the gangways 4 inches.

(a) In an ordinary classroom five rows of long desks or six rows of dual desks are best, but in a schoolroom providing for more than 60 children there should be more than four rows of long desks or five rows of dual desks.

If a schoolroom is 18 feet wide, three rows of long desks or four of dual desks may be used; if the width is 22 feet the rows may be four and five respectively.

Long desks should be so arranged that the teacher can pass between the rows. Where dual desks are used this is not necessary, as the gangways give sufficient access. The teacher should be able to pass behind the back row of desks.

(b) The desks should be very slightly inclined to the angle of 15 degs. is sufficient. The objection to dual desks is that it has a tendency to make the children look at the teacher. A raised ledge in front of a desk interferes with the writing. The edge of the desk when used for writing should be vertically over the edge of the seat.

(c) Single desks are not necessary in an ordinary elementary school.

#### Section 7.—Accommodation.

The accommodation of the school, i.e. the number of places for which the school is finally recognised, should depend in part on the arrangement of the desks, and must be approved by the Board.

No central hall or corridor, and no classroom, kitchen, laundrywork, handicraft, drawing or science room, should be counted towards the accommodation.

When the building to be erected is for the use of a school, the plans of the schoolroom (if any) and of the other rooms must show an average of not less than 100 square feet of floor-space for each place proposed to be provided.

### COLOUR IN ARCHITECTURE.

FROM the beginning of the world there has never been a true or fine school of art in which colour was despised. It has often been imperfectly attained and judiciously applied; but it is one of the essential elements of life in a school of art that it loves colour, and one of the first signs of death in the Renaissance schools that it despised colour. Observe, it is not now the question whether our northern cathedrals are better with colour or without. Perhaps the monotone grey of nature and time is a better colour than any that the human mind can give. The simple fact is, that the builders of those cathedrals laid upon them the brightest colours they could obtain, and that there is not in Europe any monument of a true school which has not been either painted all over or vigorously touched with paint, mosaic and gilding in the prominent parts. Thus far Egyptians, Greeks, Arabs and Mediaeval Christians all agree; none of them when in their right senses, ever think of doing without paint. The Venetians thoroughly sympathised with the Arabs in this respect, for their intense love of colour led them to lavish the most expensive decorations on their dwelling-houses; and secondly, that perfection of the instinct in them enabled them to render whatever they painted in this kind as just in principle as it was gorgeous in appliance.

Messrs. William Collins, Sons & Co., Ltd., of 71, Abchurch Lane, London, E.C., are publishing a series of novels by the best authors. The issue of this new right series makes it possible for every one to obtain for a small sum a real library of the best books by the authors of modern times. Each volume is clearly printed in bold type, nicely bound in cloth with gilt back, and sold at the price of 7d. net.

## SOUTHWELL MINSTER.

as long been known to the watchful eye of the guardians of this venerable structure that a settlement was taking place in the walls of the north and south transepts. Some fifty years ago the south transept gable was stiffened with heavy iron braces, but this was not considered necessary in the case of the north transept. The cracks caused by this settlement have been filled up with cement and kept under observation, and it was found that this pointing has become loose and in some places has fallen out, and further that a crack has appeared in a window-sill which was only inserted during the reconstruction of 1851, clearly shows that further movement is taking place, which might at any time develop into a danger. Some of the alarmist reports which have been current as to the safety of the fabric are, however, exaggerated. It has, nevertheless, been considered prudent, in view of what has occurred at Winchester and elsewhere, to take immediate steps to strengthen the foundations and render the superstructure secure. The south transept has been shored up with massive baulks of timber, and the old Norman foundations are being removed in sections and replaced by a solid mass of cement concrete, some 6 feet deep and 12 feet wide, resting on the ground on which the minster is built, and directly supporting the ancient superstructure. The south transept is now prepared for the shores, but it will not be proceeded with until the work on the north transept has been completed. When this is accomplished there should be no danger to the safety of these parts of the ancient edifice. Work is being carried out by Messrs. Cornish & Co., of North Walsham, under the direction of Mr. J. Caroe, the architect to the Ecclesiastical Commission, who are responsible for keeping the fabric in

two men can be employed at a time. But arrangements are being made for a night shift. The pit in No. 2 pier is down 24 feet from the road level. There are twenty-four men employed on the bridge and the expenditure to this date has been 772*l.*—(Signed) W. S. WILSON.

## COTTAGE, BURNHAM BEECHES.

THIS cottage has been built at the rear of "Highlands," Farnham Common, and the owner intended it to be used by a gardener or chauffeur. It is rough-cast (whitened) outside, with wood and ironwork finished with "indestructible" green paint; the roof is covered with Somerset Trading Company's Bridgwater patent red tiles. The architect is Mr. Jno. Wornell, of Farnham Common, Slough, Bucks, and the builders Messrs. Burfoot & Butler, Slough.

COTTAGE, BURNHAM BEECHES. (John Wornell, Architect.)

## AYR AULD BRIG.

Report to Messrs. Shaw and Welsh, hon. secretaries, Ayr Auld Brig preservation committee, dated September 11, 1907. S. Wilson, the engineer, states:—The pointing of the arches and three piers is completed; the roadway the length of the bridge has been removed and the four piers have been repaired and strengthened with a covering of concrete as formerly described. The cross walls at the ends and the central spandril walls are all finished. The motor has proved satisfactory, and the grouting of the piers 1 and 2 is done. The pit in the No. 1 pier is to the full depth of 39½ feet from the road level, the concrete has been laid, and the excavation for underpinning is going on. This is necessarily slow work, as only

## NOTES AND COMMENTS.

A CONFERENCE of members of the municipal corporations of London and the home counties will be held at Letchworth to-day on "The Housing Lessons of Garden City," over which the Lord Mayor of London will preside. Dr. T. J. MACNAMARA, M.P. (parliamentary secretary to the Local Government Board), is to speak with reference to the Government's promised Housing and Town Planning Bill, to be introduced next session. Mr. PERCY ALDEN, M.P., will move a resolution dealing with the practical lessons of the Garden City experiment with regard to housing and town planning. The Lord Mayor will be supported by the aldermen and sheriffs of the City Corporation and others.

THE credit of designing the earliest cloud-piercing office building is not to be given to the late W. L. JENNEY, of Chicago, unchallenged. Already there are several RICHMONDS in the field, and in a country which is prolific of new ideas, and when almost every second man has his stock of notions, that is not surprising. It is now said there is no question but that Mr. JENNEY actually built the first tall building in Chicago, the Home Insurance Building, but others claim that Messrs. BURNHAM & ROOT had planned, though not erected, that mode of construction at a prior time. Other candidates for the honour have presented their claims. In one case Mr. BUFFINGTON, of Minneapolis, seems to have the best foundation for his contention, as he is the only possessor of a United States patent for that mode of construction, and has actually filed suits against owners of some tall buildings for having infringed his idea. Latest developments, however, bring out that his claims are combated by Mr. F. W. FITZPATRICK, of Washington, who asserts that the BUFFINGTON patent is invalid because it was not that gentleman's own conception, he having "absorbed" it from Mr. FITZPATRICK, who was then, in 1883, his chief assistant, and who had elaborated the scheme of tall construction with an engineer named STROM. Whether the scheme of construction was the invention of any one individual, or, as contended by some, a natural evolution, a logical solution of the problems before them, a conclusion arrived at by many architects and engineers simultaneously, it seems that the architectural profession deserves the greater praise, though the matter is so essentially an engineering one, for its introduction and perfection.

THE third divisional volume of "The Modern Plumber and Sanitary Engineer," edited by Mr. G. LISTER SUTCLIFFE (The Gresham Publishing Company), has appeared. It contains three sections, viz. "Hot-water Services," by Mr. A. HERRING SHAW; "Warm Air and Ventilation," by Mr. HAROLD GRIFFITHS; and "Sanitary Plumbing and Drainage" (incomplete), by Mr. E. THOMAS SWINSON. In addition to plates, there are about 140 illustrations, all drawn in a style which practical men can appreciate. The following extract from Mr. SHAW's treatise if generally known might save some apprehension among nervous tenants:—"Unpleasant noises are occasionally observed in hot-water supply systems, especially when the temperature in the boiler is greatest. Various causes, enumerated below, may be responsible for these:—(1) Boiler too large for the requirements, steam being generated more rapidly than it can quietly escape; it therefore makes its way through the flow-pipe into the cylinder, and thence forces its way through the expansion pipe, driving out large quantities of hot water in 'geyser' form. (2) Escape of air which has been imprisoned in the boiler by the flow-pipe passing into the latter and forming an air space, or by the uneven setting of the boiler, the flow-pipe end being lower than the opposite end. This fault may develop after the fixing of the boiler, owing to insecure setting. (3) Partial stoppage of the circulation pipes (generally due to deposit of lime), which greatly retards the flow of

water to and from the boiler and causes large quantity of steam to be generated. (4) Dips in the circulation pipes, forming air traps, which greatly affect the circulation of water between boiler and cylinder." The extract will suggest the comprehensive system adopted for book and the recognition of what to many may seem trifles.

AN interesting paper on Heraldry, or rather the Arms in relation to books, was read by Mr. C. DAVENPORT, F.S.A., at the Librarians' Conference, Glasgow on Tuesday. He maintained that the English coat-of-arms is the oldest of all, for two golden lions passant on a red ground appeared on a seal of King JOHN in 1180. The third lion, which was derived from Aquitaine, was introduced in the great coat of RICHARD I. The fleur de lys was assumed by EDWARD III. The first royal coat-of-arms used in binding was in the reign of HENRY IV., and it occurred on a loose cover now in the library at Westminster Abbey. HENRY VII. used the same coat, but also as supporters the red dragon of Cadwallader, and the white greyhound of "De Beaufort." The latter was omitted by HENRY VIII. in 1528, and the lion rampant was substituted. With the advent of JAMES VI. of Scotland to the Throne of England, in 1603, he brought the ancient Scottish coat (first used in 1170) into the English coat, as well as the harp of Ireland. The Scottish coat was "Or, a lion rampant with double tressure flory-counter-flory, gules." JAMES VI. bore the English coat in the first quarter, the Scottish in the second and the Irish coat "azure, a harp stringed argent," in the third quarter. The harp had been given to Ireland by HENRY VIII. as a mark of appreciation of the Irish love of music. JAMES also altered the supporters by abolishing the red dragon in favour of the unicorn—one of the ancient Scottish supporters. The supporters (the lion and the unicorn) have remained the same ever since.

## ILLUSTRATIONS.

CARLTON HOUSE, REGENT STREET.

CITY OF MELBOURNE ADMINISTRATION OFFICES.

WE illustrate in this issue the main elevation of Swanston Street and plans of the two principal floors for the new administrative buildings for the Melbourne town hall. It is proposed to commence the erection of these buildings immediately, and Messrs. GRAINGER, KENNEDY & LITTLE, whose design was awarded first prize in the recent competition, are engaged in the preparation of the contract drawings and specification. The building will occupy the site of the old police courts. The existing buildings will be forthwith demolished and all the materials cleared away. The new buildings will be erected on concrete foundations with bluestone (basalt) base, faced generally with Sydney sandstone. The elevations are to follow the general lines of the architecture of the present town hall. The floors and the partitions will be of reinforced concrete, and the construction generally will be of fire-resisting materials. In the main corridors and staircase it is proposed to utilise Australian marble for facings, whilst some of the choicest Australian timbers—cedar and blackwood—will be utilised for joinery and fittings. The building is to be lighted and heated by the elevators worked by electrical energy; a supply of which will be obtained from the City Council's main power station. The plan of the first floor shows the connection between the old and new buildings by means of a bridge. It is estimated that the cost of this portion of the work will be about 50,000/., and upon completion of the drawings tenders will be called forthwith.

CATHEDRAL SERIES.—SOUTHWARK: NORTH TRANSEPT.

## THE PALACE OF WESTMINSTER.

the report of the committee of the House of Lords, which appeared in *The Architect* of the 6th inst., there references to the reports of the Commissioners of Fine Arts. The most important is the seventh, from its containing the scheme of the committee appointed to select subjects for painting and sculpture for the future decoration of the Palace of Westminster. The members were Prince Albert, Marquis of Lansdowne, Lord John Russell, Lord Lytton, Lord Mahon, Mr. T. B. Macaulay and Mr. Henry James, the historians, Sir Robert Harry Inglis, a distinguished member of the House of Commons, with Mr. Thomas Wyse, also a member, and who was believed to be familiar with art as applied to the decoration of buildings. As the report of the committee is now to be printed with difficulty, we have been advised to reprint it without it the Lords' report becomes less clear:—

Your committee have first to observe that the general plan on which subjects were proposed to be selected has been defined by the Commissioners in their Sixth Report to Her Majesty in the following words:—"In accordance with the principles which have already guided us in deciding on the plan of decoration in the House of Lords, viz. with reference to fresco-paintings, stained windows and statues proposed for that locality; and also in the selection of subjects proposed for St. Stephen's Porch, St. Stephen's Hall and the royal approaches: we conceive it to be the duty of this Commission, for the better guidance of present and future artists, and in order to maintain a character of unity and harmony worthy of such a building, to determine a complete scheme for the future decoration of the Palace. We are of opinion that, in determining such a scheme, the special destination of each portion of the building should be attended to; that, in the selection of subjects, the chief object to be regarded should be the expression of some specific idea: and the second, its illustration, by means of the well-known historic or poetic incident adapted for representation in painting."

The duty which has devolved on your committee being thus defined, their labours have been directed to the selection of subjects in accordance with the principle above explained. They have, for the present, given their attention to subjects for painting; a considerable number of names of distinguished persons to whom statues might with propriety be erected having been before proposed, and of these we have been selected by former committees for particular localities.

St. Stephen's Porch, containing two compartments, one measuring 26 feet high to the point of the Gothic arch, by 12 feet 8 inches wide; the other measuring 18 feet 3 inches high to the point of the arch, by 11 feet 4 inches wide.

In this porch will be four pedestals, on two of which it has been recommended to place the statues of Marlborough and Nelson; and your committee were of opinion that the subjects of "Peace" and "War" would be appropriate in the two compartments intended for painting.

St. Stephen's Hall, containing on the side wall eight compartments, each measuring 14 feet 5 inches wide by 8 feet 8 inches high; and two end compartments, one measuring 20 feet 9 inches high to the point of the arch, by 12 feet 6 inches wide; the other measuring 17 feet 6 inches high to the point of the arch, by 11 feet 3 inches wide.

An opinion has before been expressed, by the Commission generally, that as St. Stephen's Hall stands on the spot where the House of Commons was, during many centuries, the habit of assembling, it should be adorned with statues of men who rose to eminence by the eloquence and abilities which they displayed in that House. Twelve personages selected on this principle were accordingly named in the report of the Commission to Her Majesty.

Your committee conceived that the walls might properly be decorated with paintings illustrating some of the greatest events in our constitutional, social and ecclesiastical history, from the time when the Anglo-Saxon nation embraced Christianity to the accession of the House of Stuart; and the following subjects would be well adapted for this purpose:—

1. In the State (for the side compartments).—"A Sitting of the Wittenagemot," "The Feudal System—the Homage of the Barons to William the Conqueror," "The Origin of the House of Commons—the first Writ brought down to the City of London," "The Termination of the Baronial Wars at Stanley and Oxford crowning Henry VII. over the dead body of Richard III.," "An Early Trial by Jury," "The

Signing of Magna Charta," "The Abolition of Villeinage"—a Lord on his Deathbed, attended by the Clergy, manumitting his Villeins," "The Privileges of the Commons asserted by Sir Thomas More against Cardinal Wolsey."

II. In the Church (for the end compartments).—West end: "The Conversion of the Anglo-Saxons to Christianity—the Preaching of St. Augustine." East end: The Reformation—Queen Elizabeth receiving the Bible in Cheap-side."

The central hall, containing four compartments, each measuring 17 feet 7 inches high to the point of the Gothic arch, by 12 feet 7 inches wide, and three small panels underneath three of the large compartments, each measuring 5 feet 5 inches high to the point of the arch, by about 4 feet 6 inches wide.

Your committee, bearing in mind that this hall is the central point of the whole building, were of opinion that the nationality of the component parts of the United Kingdom should be the idea here illustrated, and would be appropriately expressed by representations of the four patron saints, St. George, St. Andrew, St. Patrick and St. David, in the four compartments intended for painting, and that in the three small spaces underneath three of the compartments the heraldic emblazonings of the Orders of the Garter, of the Thistle and of St. Patrick might be introduced.

Corridors from the central hall, consisting of the Peers' corridor, the Commons' corridor and the central or public corridor.

Your committee were of opinion that the corridors which join the two Houses might properly be decorated with paintings illustrative of that great contest which commenced with the meeting of the Long Parliament and terminated in 1689. It will be seen that the subjects have been selected on the principle of parallelism, and that an attempt has been made to do justice to the heroic virtues which were displayed on both sides.

The Peers' Corridor, containing eight compartments intended for painting, each measuring 9 feet 6 inches wide by 7 feet high:—"Charles I. erecting his Standard at Nottingham," "Basing House defended by the Cavaliers against the Parliamentary Army," "The Expulsion of the Fellows of a College at Oxford for refusing to sign the Covenant," "The Burial of Charles I.," "Speaker Lenthall asserting the Privileges of the Commons against Charles I., when the Attempt was made to seize the Five Members," "The setting out of the Train Bands from London to raise the Siege of Gloucester," "The Embarkation of a Puritan Family for New England," "The Parting of Lord and Lady Russell."

The Commons' Corridor, containing eight compartments intended for painting, each measuring 7 feet 9½ inches wide by 6 feet 6 inches high:—"Charles II. assisted in his Escape by Jane Lane," "The Executioner tying Wishart's Book round the Neck of Montrose," "Monk declaring for a Free Parliament," "The Landing of Charles II.," "Alice Lisle concealing the Fugitives after the Battle of Sedgemoor," "The Sleep of Argyll," "The Acquittal of the Seven Bishops," "The Lords and Commons presenting the Crown to William and Mary in the Banqueting House."

The central corridor, containing six compartments each measuring 8 feet 9 inches high by 7 feet wide.

The paintings in St. Stephen's Hall, and in the corridors which join the two Houses, illustrate the gradual progress of our institutions during the interval which elapsed between the introduction of Christianity and the Revolution. It has been thought that the central corridor might with advantage be adorned with paintings exhibiting in strong contrast the extremes which are separated by that interval. With this view, six subjects have been selected: in three Britain appears sunk in ignorance, heathen superstition and slavery; in the other three she appears instructing the savage, abolishing barbarous rites and liberating the slave.

"The Phœnicians in Cornwall," "A Druidical Sacrifice," "Anglo-Saxon Captives exposed for sale in the Market Place of Rome," "Cook in Otaheite," "English Authorities stopping the Sacrifice of a Suttee," "The Emancipation of Negro Slaves."

The Upper Waiting-hall.—The subjects for six (out of

\* "The holy fathers, monks and friars, in their confession, and specially in their extreme and deadly sicknesses, burdened the consciences of them whom they had under their hands: so that temporal men, by little and little, by reason of that terror in their conscience, were glad to manumit all their villeins."—Sir Thomas Smith, *Commonwealth*, book iii. c. 10.

† See Woodrow, *Church History*, book iii. c. 9, s. 9.

eight) compartments in this locality have been before proposed to be selected from the following poets:—Chaucer, Spenser, Shakespeare, Milton, Dryden and Pope. The choice of such subjects being left to the artists appointed, or to be appointed, to execute them after they shall have been approved by the Commissioners.

The House of Peers.—The subjects for the six compartments intended for painting and the selection of historical personages proposed for statues to be placed in the eighteen niches, as well as the decorations for the stained windows, have been determined by former committees.

The Peers' Robing-room, containing three large compartments, two measuring 20 feet wide by 10 feet 6 inches high, the third measuring 22 feet wide by 10 feet 6 inches high, and six smaller compartments, each measuring 7 feet by 10 feet 6 inches high.

Your committee being desirous to vary the proposed decorations, and conceiving that Scripture subjects—as affording scope for the highest style of design, and as being especially eligible on other grounds, should by no means be excluded—considered that the above-named locality, in which the principal compartments intended for painting are of considerable magnitude, would be well adapted for such subjects. Your committee were of opinion that the illustrations should have reference to the idea of justice on earth and its development in law and judgment, and that the following subjects would be appropriate.

In the single large compartment on the west side. (1) "Moses bringing down the Tables of the Law to the Israelites."

In the two small compartments on the east side (2) "The Fall of Man," and (3) "His Condemnation to Labour."

On the south side, in the larger compartment (4), "The Judgment of Solomon," and in the two smaller (5) "The Visit of the Queen of Sheba," and (6) "The Building of the Temple."

On the north side in the larger compartment (7), "The Judgment of Daniel," and in the two smaller (8) "Daniel in the Lions' Den," and (9) "The Vision of Daniel."

The Royal Ante-chamber, containing in the upper part of two of the walls six large compartments (three on each side), measuring 13 feet wide by 10 feet 9 inches high. Twenty-eight upright narrow compartments, measuring 5 feet 7 inches high by about 2 feet 6 inches wide, and twelve panels for carved work, four measuring 6 feet 9 inches wide by 2 feet 9 inches high, and eight measuring 2 feet 2 inches square.

Your committee considered that the six large compartments in this locality, being at a considerable height, might be filled with copies in tapestry of the defeat of the Spanish Armada; taken either in part or altogether from the designs of the tapestry originally existing in the House of Lords, which your committee conceived it is of great importance to preserve as far as possible to the nation.

That the twenty-eight upright compartments might be appropriately filled with portraits relating to the Tudor family:—(1) "Henry VII.," (2) "Elizabeth of York," (3) "Arthur, Prince of Wales," (4) "Catharine of Aragon," (5) "Henry VIII.," (6) "Anne Boleyn," (7) "Jane Seymour," (8) "Katharine Howard," (9) "Anne of Cleves," (10) "Katharine Parr," (11) "Edward VI.," (12) "Queen Mary," (13) "Philip II.," (14) "Queen Elizabeth," (15) "Louis XII.," (16) "Princess Mary, Queen of France, Duchess of Suffolk," (17) "Charles Brandon, Duke of Suffolk," (18) "The Marchioness of Dorset," (19) "Lady Jane Grey," (20) "Lord Guildford Dudley," (21) "Princess Margaret, Queen of Scotland, Countess of Angus," (22) "James IV.," (23) "Douglas, Earl of Angus," (24) "James V.," (25) "Mary of Guise," (26) "Mary, Queen of Scots," (27) "Francis II.," (28) "Lord Darnley."

That the twelve panels might be filled with the following subjects in carved work:—

1, 2. "The Field of the Cloth of Gold" and "The Visit of Charles V. to Henry VIII.," in the two compartments on the east and west sides.

3, 4, 5. "The Escape of Mary Queen of Scots," "The Murder of Rizzio," and "Mary looking back on France," in the three compartments on the south side, west of the door, "The Escape of Mary Queen of Scots" occupying the centre panel.

6, 7, 8. "Queen Elizabeth knighting Drake," "Raleigh spreading his Cloak as a Carpet for the Queen" and "Raleigh landing in Virginia," in the three compartments on the south side, east of the door, the subject of the knighting of Drake occupying the centre panel.

9, 10, 11, 12. On the north side, "Edward VI. granting

a Charter to Christ's Hospital," "Lady Jane Grey at Studies," "Sebastian Cabot before Henry VII.," "Catharine of Aragon pleading."

The Royal Gallery.—A considerable space on each wall, measuring 77 feet 6 inches wide, not being subdivided into compartments, your committee were of opinion that such space should be occupied by one large and two smaller subjects, the smaller corresponding in width with the width of one window and measuring 12 feet 6 inches wide by 11 feet 6 inches high, the larger comprehending the width of three windows and measuring 45 feet wide by 11 feet 6 inches high. Of the remaining compartments defined by the architect two on the side walls measure each 13 feet 3 inches wide by 11 feet 6 inches high, four on the same length in the end walls measure 12 feet 2 inches wide by 11 feet 6 inches high; the six remaining compartments, three on each end in the upper part of the walls, measure 12 feet 2 inches wide by 19 feet 7 inches high. The compartments would therefore be eighteen in number.

Your committee were of opinion that the subjects for the Royal Gallery should relate to the military history and glory of the country, and that the following subjects would be appropriate.

In the three upper compartments in the south wall (1) "Boadicea inciting her Army," (2) "Alfred in the Camp of the Danes," (3) "Brian Boromhe overcoming the Danes at the Bridge of Clontarf."

In the three upper compartments in the north wall (4) "Edith finding the dead Body of Harold," (5) "Richard Cœur de Lion coming in sight of the Holy City," (6) "Eleanor saving the Life of her Husband, afterwar Edward I., by sucking the poison from the wound in his arm."

In the compartments next the proposed large compartment on the west wall:—(7) "Bruce, during a Retreat before the English, protecting a Woman borne on a Litt and checking the Pursuers," (8) "Philippa interceding for the Lives of the Citizens of Calais."

In the lower compartments on the north wall:—(9) "Edward the Black Prince entering London by the side of King John of France," (10) "The Marriage of Henry at Troyes, with the Princess Katharine of France."

In the compartments next the proposed large compartment on the east wall:—(11) "Elizabeth at Tilbury," (12) "Blake at Tunis."

In the remaining compartment on the east wall:—(13) "Marlborough at Blenheim."

In the lower compartments on the north wall:—(14) "The Death of Wolfe," (15) "The Death of Abercrombie."

In the remaining compartment on the west wall:—(16) "Lord Cornwallis receiving the Sons of Tippoo as Hostages."

In the large compartment on the west wall:—(17) "The fall of the Bastille—the Death of Nelson."

In the corresponding compartment on the east wall:—(18) "Waterloo—the Meeting of Wellington and Blücher."

The Queen's Robing-room, containing compartments of various dimensions, adapted for painting and other decorations.

Your committee, influenced by the considerations before expressed as to the expediency of varying the character of the decorations proposed, were of opinion that a series of paintings and other works of art, illustrating the legend of King Arthur, would be appropriate in this locality; and your committee unanimously agreed to recommend to the Commission that the execution and entire superintendence of such decorations should be entrusted to Mr. Dyce, who has already executed a fresco in the House of Lords.

The Guard-room, containing two compartments, each measuring 12 feet wide by 8 feet high.

Your committee conceived that these compartments might be filled with the following subjects:—(1) "Your Talbot defending his Father in Battle," (2) "Isabel Douglas barring the Door with her Arm to protect James of Scotland."

The Lobby of the Guard-room, containing one compartment, measuring 14 feet 5 inches high to the point of the Gothic arch, by 10 feet wide. For this locality your committee selected the subject of "St. Edmund the Martyr slain by the Danes."

The Norman porch, containing two compartments, each measuring 18 feet 2 inches high to the point of the Gothic arch, by 10 feet 10 inches wide.

It was the opinion of your committee that these compartments would be appropriately filled with the two

Following subjects:—(1) "Canute reproving his Courtiers."  
(2) "Queen Elizabeth on the Seaside after the Defeat of the Spanish Armada."

Your committee conceived that the subjects in all the localities mentioned should be accompanied with inscriptions, and, in some instances, with appropriate mottoes; that in the last-named subject the motto might be "Afflavit Deus et dissipantur," and in the subject of Canute, "Nemo dominus nisi Deus."

The Peers and Commons' refreshment-rooms.—The compartments in the two rooms belonging to the Peers might be appropriated to views of places of the chief importance within the United Kingdom. The compartments of the other rooms to views of the most remarkable places in India and the Colonial possessions of the Crown. Space might also be found for subjects connected with rural industry, the harvest, the chase, &c.

The Painted Chamber, being the hall of conference between the two Houses, contains thirteen compartments adapted for painting, two on the east side, measuring 10 feet 4 inches high by 7 feet 4 inches wide; five on the west side, the centre compartment measuring 10 feet 4 inches high by 16 feet 4 inches wide; two compartments next the corners measuring 10 feet 4 inches high by 9 feet wide, and two over the doors, measuring 4 feet 6 inches high by 6 feet 4 inches wide; three on the north side, the centre compartment measuring 10 feet 4 inches high by 14 feet 3 inches wide, and two smaller compartments, each measuring 10 feet 10 inches high by 4 feet 8 inches wide; and three on the south side, corresponding with those on the north side.

Your committee conceived that the subjects for painting in this locality might have reference to the acquisition of the countries, colonies and important places constituting the British Empire; and that the following subjects would be appropriate:—

In the centre compartment on the west side:—(1) "The Marriage of Strongbow and Eva, daughter of Dermot, King of Leinster."

In the centre compartment on the south side:—(2) "Edward I. presenting his infant Son to the Welsh as their Prince."

In the centre compartment on the north side:—(3) "James VI. of Scotland receiving the News of the Death of Queen Elizabeth; or, Setting out for England as James I."

In the two compartments next the corners, on the west side:—(4) "Lord Clive in the Battle of Plassy." (5) "Penn's Treaty with the American Indians."

In the two compartments on the east side:—(6) "The Colonisation of Australia." (7) "The Treaty of Nankin."

In the two compartments over the doors, on the west side:—(8, 9) "Incidents illustrating the Voyages to the North and South Poles."

In the small compartments on the south side:—(10, 11) "Incidents relating to the Acquisition of Mauritius and the Cape of Good Hope."

In the two small compartments on the north side:—(12) "Sir George Rooke planting the Standard of England in Gibraltar." (13) "The Surrender of Malta."

The entrance from Old Palace Yard is also intended to contain some compartments for painting, but your committee conceived that it would be proper to postpone the consideration of subjects for this locality, as it is not yet certain whether paintings can be seen in it to sufficient advantage.

With regard to the technical method in which the paintings proposed should be executed, your committee, although not prepared to offer a general recommendation on this subject, were of opinion that the pictures in the three corridors leading from the central hall and the pictures in the refreshment-rooms should be painted in oils, and that the Queen's Robing-room, St. Stephen's Hall and the Royal Gallery should be painted in fresco. The representations of the four patron saints from their size and situation might be advantageously executed in mosaic (like the four evangelists in the pendentives of the cupola of St. Peter's), thus giving an opportunity for the introduction into England of an art highly valued in other times and countries.

Your committee have further to observe that movable oil-paintings, not coming within the general plan proposed, might be placed in committee-rooms and in other parts of the building.

A Painting by Rubens known as "La Bacchanale d'Enfante," which was stolen from the collection of the Comte d'Hasselt in Brussels, has been discovered and the thief is in prison.

## EXCAVATIONS AT CORSTOPITUM.

MEMBERS of the Newcastle Society of Antiquaries on Friday last visited Corbridge, where for many months there has been a centre of attraction in the Corstopitum excavations, carried on under the supervision of Mr. C. L. Woolley, B.A., of the Ashmolean Museum, Oxford. When the Roman wall was built, from Wallsend to the Solway, there were stations set upon it for the accommodation of the soldiers. Corstopitum was not a fort like Housesteads or Chesters, but was a town, and there is no vestige of the like north of York and Aldborough save at Carlisle, where the site is over-built. Corstopitum is in the open fields and is being readily excavated, thanks to the acquiescence and support of the owner, Captain J. H. Cuthbert, and the tenant, Mr. Reed.

The site of the excavations, says the *Newcastle Journal*, is a little to the west of the town of Corbridge. Corbridge was one of the most interesting places in connection with the Roman occupation. Though not on the line of the Roman wall the town of Corstopitum was used as a sort of base for sending supplies to the soldiers who garrisoned the wall at the various stations. The Antonine itinerary supplies a list of headquarters from Dover to Bremenium in Northumberland. There was a series of roadways running right north through the country, and one of these was Watling Street—or more properly Dere Street—which passed through Corbridge. The road crossed the river Tyne by a bridge obliquely, and reached the wall at Stagshaw Bank, where now is Portgate. Corstopitum was a city in the old days, full of life and activity, and it was one of the most important places in the Antonine itinerary. In those days, it is said, a Roman legate could travel more quickly from the Tyne to the Continent than ever a man was able to journey afterwards until the provision of stage coaches once again demanded the making of passable roads.

The excavators did not start out with the expectation of finding buildings in other than a "plundered" condition, for Corbridge had been used from very early times as a quarry, and much of the hewn stone had been carried away to serve as building material. Wilfrid's church at Hexham is believed to have been constructed entirely from the material obtained from Corstopitum, and much of the church of St. Andrew at Corbridge was similarly constructed. Corstopitum occupied an area of about 25 acres, and stood on the slope immediately above the river, and its suburb was probably very extensive. The extent of the excavations was in the beginning limited by lack of funds, but subsequent subscriptions enabled the work to be extended, and it has progressed indefatigably under the direction of Mr. Woolley. Several trenches were cut in the beginning, and the ancient ramparts of the city were discovered. Most interesting also was the discovery of the basements of several buildings and very heavy foundations of concrete. The remains were found of rooms heated by hypocausts or furnaces, and the walls of one of these houses remained to a height of 12 inches above the floor. These were covered with plaster, upon which frescoes were painted, but the paintings perished on exposure to the air. There were several subsidiary finds, such as are not uncommon in Roman stations, including pottery, ornaments and domestic implements. There were found also lying in a cistern, into which they had been thrown, a carving in stone of a lion devouring a stag, this having evidently been used for a fountain.

Mr. Woolley met the visitors at a table upon which the more portable "finds" had been set out, and explained them in detail. There were styli, a bronze plaque, flint arrow-heads, bones, ornaments, a curious draughts-board, with pieces and a die; a beautiful intaglio and many fragments of pottery. The examples of ware, he said, occupied a very large part of a potter's shop found close by, the shop-keeper having evidently had extensive dealings in these things. There were fragmentary inscriptions of the Sixth Legion, which were of interest as showing the part played by that legion in the building of Corbridge, particularly in the later period. The draughts-board was made of stone, the squares being roughly cut upon the surface. There was a fine example of a bronze ring-brooch or safety-pin, which might almost be described as Celtic rather than Roman; and the same statement applied to the bronze plaque, enamelled. There was a perfect example of Roman glass, supported by a bronze chain, which had evidently been a lady's scent-bottle. Mr. Woolley displayed what he called a "comic decanter," in ware, and several examples of potters' marks, one being on the rim, which was unusual.

A bundle of copper coins—"minimi"—were exhibited, these having been found lying in the gutter at the roadway, where they had apparently been left in a bag or box. A bronze eagle had probably come from the top of a helmet, and there was a bronze signet. A beautifully engraved intaglio had a snail cut upon it; and there were flint remains which, taken from beneath the Roman strata, seemed to give confirmation of the theory that there had been a settlement there in the neolithic age.

The inspection of the explorations was begun at the south end, where the excavators had exposed the approach to the bridge that crossed the Tyne there at a time when its course was straighter than it is to-day. The abutment had disappeared, but the road that was carried across the river—incorrectly named Watling Street, and more properly Dere Street—had been laid bare at its varying levels, and Mr. Woolley said it was intended to trace the line of the road northwards with the object of seeing whether it ran through the town or, as he believed, skirted its western edge. There were three road levels formed at different periods.

The inspection progressed to the magnificent foundations of the southern house, with its concrete corridor, its door-step and its apartments, and its finely preserved hypocaust. Near at hand was the cistern that had contained the sculptured lion and stag. Mr. Woolley explained the difficulty of assigning a date to the buildings, the floors having been built and overbuilt, each floor being less skilfully made than that which preceded it—a sign of degeneracy. The lion and the stag had been thrown into the cistern with other material to bear a floor that had been built above it. Between two floors a coin of Carausius had been found. The terracing of the town upon the slope was illustrated, and then the visitors were conducted to the higher ground, where the potter's shop had been unearthed. The different kinds of ware had been found in the very positions in which they had been when exposed for sale; and the money found in the till showed that the Samian pottery was manufactured 200 years later than had generally been supposed. The lock and key of the shop door were found, where they had fallen when the place was destroyed by fire. Near at hand was the spot where the hoard of copper "minimi" had been found; and the circumstance that they were found in the gutter led to the assumption that they must have been dropped there at the time of the abandonment of Corstopitum; otherwise, Mr. Woolley submitted, they would not have lain there long. They were mostly coins of the fourth century—of Constantine and his successors. The ground plan of the buildings, so far as the foundations have been exposed, was explained in a lucid, interesting way by Mr. Woolley.

The work, of course, is just beginning, and the excavators have before them a task which will last five years. It is being carried out by the Corbridge Excavation Committee, whose president is the Duke of Northumberland, the secretary being Mr. W. H. Knowles, F.S.A., of Gosforth. A sum of £1,700 has been given in donations and a further sum of 300l. is required. Mr. Woolley has been assisted by Mr. R. H. Forster, and Mr. Knowles is frequently upon the site of the excavations.

#### ARTHURET AND SCALEBY.

A PARTY of members of the Cumberland and Westmorland Antiquarian and Archaeological Society last week visited the Arthuret and Scaleby districts. On arriving at Arthuret Church, says the *Carlisle Journal*, the party inspected the building and the graves of the Grahams of Netherby.

Canon Bower, in a paper on the church, said the parish of Arthuret contained part of what was once known as the debateable land. The church goods therefore in such a neighbourhood would be likely to be scarce and mean. The church itself was in such poor condition in 1609 that it had to be rebuilt by the help of a charity brief granted by James I. In 1868 a faculty was granted to make certain alterations and amendments, including the repair of the windows. The east window, which was dilapidated, was replaced by a new window, and the old one was now standing in the garden at Whoof House and could be seen from the Warwick Road, it having been given to the late Mr. Hope. The bowl of the font in the church was peculiar, being lopsided with a quadrangular base. In conclusion, Canon Bower described the church plate and the monuments, including those of the Grahams of Netherby.

Dr. Barnes contributed a paper on "The Battle of Ardderyd," in which he described the two tumuli near church. These tumuli were separated by the main road from Carlisle. Their position was important as being the road from Scotland to England. On the summit of one adjoining the church was a small camp, which was important having regard to the history of the parish. Dr. Barnes did not think they were sepulchral in origin. They were not mentioned in the Society's Transactions nor in its history. Probably they marked the site of an early battle between the forces of decaying Paganism and of advancing Christianity—the battle of Ardderyd.

Leaving Arthuret, the journey was resumed through Longtown, past Hallburn, and on to Beaconhill Tower, the residence of Mr. Makant, of Bolton.

Mr. J. H. Martindale, in describing the tower, said its probable date was 1584. It was in the possession of the Grahams until 1752, when it was sold to Rowland Stephenson, probably a nephew of Governor Stephenson, who bought Scaleby Castle in 1741. It was still the property of the Stephensons, now Standishs. Proceeding he said, "We are here on an ancient site. In 1890 a double stave was discovered in the field near the entrance gate, which contained the remains of two skeletons and fragments of pottery, which Lord Northesk declared to be early British. There is a short description of the find in our Transactions. The late Chancellor Ferguson says, 'The remains are in the exact state as found, but I am not sure if we can tell them to-day.' The tower before us is one of the latest types of pele towers. It was built by a Richard Graham. There is a date on the wall, 1586, which agrees with architectural details, and I think we may be satisfied the building is of sixteenth-century work. The tower is originally isolated and detached. It is an unusual type in Cumberland and has a good deal of Scottish feeling in its details. The circular gargoyles of the parapet are common in Scotland, but I think the only similar example in this country is in the building of this kind which we have in Newbiggin Hall, Westmorland. The whole treatment of the parapet, with corbels and moulded string in place of the simple oversailing course, is late and Scotch in character. The roof is slated with gables inside the parapet, leaving a walk or pathway entirely round the top. This is not common in Cumberland, although it is frequently found in Northumberland and Scotland."

Later in the afternoon the party arrived at Scaleby Castle, where they were received by Mr. Claude Lowther and Miss Aimée Lowther.

Mr. J. H. Martindale, in a paper on the castle, said this castle is of quite a different type from Breconhill, more extensive and interesting. Mr. Hodgson has told us the site was granted by Henry I. to the influential family of De Tilliols. This family held the important fortresses of Flint and Rhuddlan in North Wales. Mr. T. G. Clark, a great authority on castles, says, "It is not of the eleventh century, though an early castle, and it is treble moated. The county historians give it only two moats. The site is on a level plain with no natural fortification to take advantage of. One moat is perfect, some 500 feet in diameter, and the buildings are placed in the centre of the contained area. I do not think we have any masonry of the earlier De Tilliols remaining. The license to crenellate, dated at the very beginning of the fourteenth century, nearly 30 years earlier than Naworth, does not necessarily imply that the buildings are of the same date; it may only mean the completion of the work or even a legal sanction for confirmation of work done long before. The buildings form a rough square about 100 feet by 85 feet, the south-west angle being slightly depressed, and consists of a long and strong curtain enclosing an area some 70 feet by 80 feet with a tower or keep at the north-west angle. The east curtain had three mural turrets or re-entrant angle bastions projecting beyond the face, and there is one at the south-west angle. The entrance was by a rather narrow gateway in the depressed portion of the west curtain defended by a portcullis. The passage is some 12 feet long. To the north entered from the passage is a guard chamber with loop in external wall. On the south side is another chamber, with entrance from courtyard. The western curtain probably continued in a straight line to the south end of the keep and formed a 'fore building' or entrance to the keep. There remains the jamb and part of the arch of a door from the courtyard which has had a portcullis. In the upper part of the western curtain are several small chambers, the first tier consisting chiefly of garderobes. The second is a fine portcullis-room, 21 feet by 6 feet 7 inches, with arched and ribbed roof, and opening off at

two smaller chambers, the doors to which have the shoulder or Carnarvon arch. This feature may be derived from the Filiols Welsh connection, and gives some clue to the date, say the end of the thirteenth century. This portion of the curtain and a return to the south remains probably its full height, and has a broad parapet wall. Turning now to the tower, it quite deserves the designation of keep in preference to pele. It has always been associated with a curtain wall, is higher and stronger than most pele towers. It has been four storeys in height, and this detail alone indicates early date; the later peles have usually only three storeys. The lowest floor (now divided into two) was a single room lighted by narrow loops, high up, one in the west and one in the north wall. It has a fine barrel vault in stone and the walls are about 8 feet thick. The present door and window to the north are modern. The ancient entrance has been entirely obliterated, but was probably at the south end from the fore buildings I have mentioned. At this end you will see one or two steps *in situ* of the original circular stair which was the means of access to the upper part of the tower. The north and west walls are the only remains of the upper part, and show corbels to support the wood floors. The windows remain in the north wall and have had stone seats. The south end of the tower has been almost entirely destroyed, and any part remaining is covered by modern erections, which if cleared away might reveal the plan. The so-called bastion addition of the late fifteenth century is an octagonal projection in the angle formed by the west curtain and keep. It seems to have been two storeys in height, the lower one being vaulted. The single windows have arched heads, and I think the remains of a fireplace exist in west wall. The second door with portullis before mentioned opens into this building and the upper part seems to have given the only access to room over gateway, &c. A building at right angles on the east wall of keep and inside curtain is a very fine vaulted room 35 feet by 22 feet, now subdivided and ceiled below vault. I think this building is later than the keep, although the vault is very similar in character, but the external walls are much thinner. The upper part was either raised or entirely rebuilt in the sixteenth century by the Gilpins. Large and spacious dungeons were said in the eighteenth century to exist under this hall, and the line of the screens indicated by corbels at west end. The east curtain exists in the outline of the present buildings, and probably the wall is covered by the nineteenth-century casing. It had three mural towers, now altered in various ways, and with windows broken out. This block of buildings was originally built inside the curtain, with windows facing the courtyard, in the fifteenth century by the Musgraves. They consisted of three storeys, the old windows now blocked up. The height has clearly been settled by the curtain wall, so that they did not appear above the parapet. So much for the plan. The external masonry is very fine ashlar, but there are very few heraldic features to assist in fixing dates.

The Bishop of Barrow at the close of the paper proposed a vote of thanks to Mr. and Miss Lowther.

#### ADDITIONS TO EDINBURGH GALLERIES.

THE following pictures and portraits have been added recently to the National and National Portrait Galleries of Edinburgh:—

##### *National Gallery.*

"Scene in Wales," oil-picture by John Crome, painted in 1803 when Crome visited Wales with Mr. Gurney, the Norwich banker, to whose daughter he was then teaching drawing. It is a picture of the same type as "The Slate Quarries," in the National Gallery, London, and was at one time in Mr. Gurney's possession. Purchased.

"Gil Blas and the Archbishop of Granada," oil-picture by W. E. Lockhart, R.S.A., dated 1878, in which year it was exhibited in the Royal Scottish Academy. It was also shown at the Edinburgh International Exhibition, 1886, at the New Gallery, and again at the R.S.A. the year after the artist died. Purchased.

##### *Scottish National Portrait Gallery.*

"William, 9th Earl of Glencairn" (1610?-1664), oil-portrait by an unknown Dutch artist. Glencairn was Lord Chancellor and a very prominent figure in Scottish affairs after the Restoration. The picture was engraved for Pinkerton's well-known book on Scottish portraits. Purchased at the sale of the Duff House collection.

"Robert Stevenson" (1772-1850), oil-portrait by John

Syme, R.S.A.; the famous lighthouse engineer and grandfather of R. L. Stevenson. Purchased from the Gray Bequest.

"Mrs. Scott" (died 1819), oil-portrait by George Watson, P.S.A.; daughter of Dr. Rutherford and mother of Sir Walter Scott. Purchased from the Gray Bequest.

"Professor Sir John Leslie" (1776-1832), drawing by John Henning, H.R.S.A., mathematician and natural philosopher. Purchased from the Gray Bequest.

"Andrew-Betts Brown" (1839-1906), oil-portrait by R. B. Bell, A.R.S.A.; mechanical engineer and inventor. Presented by his family.

"Allan Cunningham" (1784-1842), drawing by J. J. Penston; poet, critic and biographer. Presented by Mr. W. Skeoch Cumming.

"Sir Walter Scott" (1771-1832), marble bust by Sir Francis Chantrey, R.A.; executed from fresh sittings about 1828, when Chantrey presented the marble he had executed in 1823 to Sir Walter. It was subsequently in Sir Robert Peel's collection. Presented anonymously.

#### THE INFLUENCE OF ART.

AN address was delivered by Mr. D. Y. Cameron, R.I.A., at the opening of the exhibition of the Cumberland and Westmorland Society of Arts and Crafts. He said there was scarcely a branch of human industry that was not concerned with art, and those branches which were not should be, and among the many indications of the cultivation of art and the interest shown in art were the exhibitions, such as this, which had sprung up in different parts of the country, and more especially those which dealt with arts and crafts rather than the pictorial art in which he himself was interested. Such exhibitions were not philanthropic, but had a definite purpose. They had grave dangers if they had great advantages, and if exhibition authorities learned the absolute necessity of the most drastic exclusion of anything but the best which they could lay their hands on, all would be well. The benefits arising from those exhibitions were various. As iron sharpened iron, so competition stimulated interest and brought out qualities which otherwise might have remained dormant. In dealing with what ought to be avoided, he warned them against eccentricity and laid emphasis upon the need for reticence and reserve. He reminded them that shouting was not oratory, and that blazing primary colours did not make for those subtle qualities which were the enchantment and glamour of the finest art. A woman in orange and scarlet and green and diamonds was not an ideal of shy, winsome womanhood. What they should seek for was reticence and quiet, pure beauty, which were the essence of fine art. It was grace and beauty which always won and held their affections; chaste beauty of line, simplicity and austerity of design. They should avoid the very suggestion of prettiness and unnecessary ornament, and seek after complete and expressive workmanship, inside and outside, above and below, for the gods saw everywhere. They should insist upon expressive completeness in all things and avoid finicky finish. Those things, and a noble individualism, must be the pursuit of those who would create beauty. In no department of human activity did individuality count for more. Whatever might be the equality dreamed of by some political dreamers it was quite certain that in the domain of art there could be none. In that domain they must ever have the mountain peaks of genius and the light and shade of varied attainment. Clear, strong individualism could only be acquired after long and patient study, and to produce the greatest there must be a combination of head and heart and hand and passion. The great story of the past must be read in its art and ornaments, and its teachings of war and peace must be fully understood. The restless commercial, what he ventured to call the transitional, features of the present must be accepted and conquered, so that the harvest of beauty might be greater in the days to come. The Church and the world both required a new outpouring of beauty. The Church was once the patron of the arts and gathered all the arts under her protection. This had not been the case for centuries past, but he believed the time was coming again when the arts would be gathered together by the Church. Everywhere there was manifest a desire for beauty in the Church, a desire to restore the fallen pillars and buttress the crumbling walls, and to add beauty to the House of the Lord. They wanted generous hearts to pour forth and renew the early beauty, and might the vessels be the consecrated work of the artists and not produced by the

dozen in the factory. Beauty could never hinder but only quicken, and because of this they hoped the Church would give heed to those things and wield its might and influence for all that was lovely and of good report. It would be well if Governments and corporations recognised that funds devoted to the encouragement of the arts were thrice blessed and yielded fruit a hundredfold. Britain was no longer the workshop of the world, and it was only by superiority in design and quality of manufactures that we could hold our own. Every effort was needed in these days of international competition. There was no room for shoddy. Let other nations manufacture shoddy, but let Britain look to perfect manufactures and perfect design and encourage every school which tended to educate the masses in every branch of art. The pursuit of art in its material forms was essential, for in it was the germ of a brighter and better day for their arts and manufactures. It was a joy to all who took part in the work. All great art must be done under the influence of joy. Sorrow did not produce any art. The artist must be always joyful. Referring to the crafts section, he said they wanted the crafts developed. They had often too much of the pictorial. Their crafts must be inspired by the finest feeling for art if they were to retain their place in the world, and it was the department in which they might see the beginning of a better day. They must insist upon completeness of work, no scamping, no shoddy, but the putting of their whole strength and power and design into it. Everything should be made beautiful, so that the articles in common use might truly be a joy for ever. In conclusion, he expressed a hope that this Society might do much for art in this rich Border region, and in the future produce men who would make the district famous. He hoped this exhibition would be well attended, so that the members of the Society might be encouraged in their future efforts.

### THE MILLTOWN COLLECTION, DUBLIN.

THE whole of the collection of pictures, silver, furniture and bric-à-brac presented by Lady Milltown to the National Gallery of Ireland as a memorial of her late husband, the sixth Earl of Milltown, on condition that the collection should be exhibited as a whole and by itself in a suite of rooms specially set apart for this purpose, is now open to the public. At the time the gift was offered there was no space in the gallery for the housing of such a collection, but with the building of the new wing in 1903 it became possible to comply with the terms of the deed.

Viewed as a whole, says the *Irish Times*, the collection is certain to excite controversy. Many of the works of the late Italian schools, for example, are frankly bad both in feeling and treatment, while it can hardly be denied that a good deal of the furniture is unsuitable for a public museum or gallery. But there is another side to the question, and most lovers of art will rejoice at the acquisition of a number of beautiful things, including a superb Reynolds, some interesting French and Italian pictures, and a really fine collection of silver.

As one enters the Milltown rooms from the anteroom one is conscious of a certain charm that does not belong to the ordinary gallery, with its formal rows of pictures, its bare rooms, its air of cold aloofness. Here, in sharp contrast to the other rooms in the gallery, the pictures, not wholly monopolise the attention. The large Reynolds group in the central room—by far the finest work in the whole collection and worth all the rest of the pictures put together—is flanked by two small statuettes on pedestals, beyond which are two tall mirrors. These things are wholly unimportant in themselves from the point of high art, but they serve to throw into relief the fine flowing canvas on which George, first Marquis of Buckingham—he was Earl Temple when the group was painted—is represented with his wife and son. As one sits on the roomy velvet-covered eighteenth-century sofa opposite the picture, itself a fine splash of crimson lake against the low-toned greys and browns of the walls; as one looks round the room with its corner cupboards filled with shining silver, its console tables with their clocks and candlesticks, its rows of stiff chairs of a bygone pattern—everything, in short, that suggests human relationships and a human environment, one feels that it is thus that the savour of pictures is best extracted rather than in the bare gallery where they jostle one another for elbow room, and where discomfort seems inevitable. Looking thus round the rooms one is conscious of a sense of esthetic pleasure, and one is in the mood to

pardon the gallery authorities for the catholicity of their instincts.

The Reynolds already referred to is a portrait group of four whole-length figures set in a landscape background. In the centre, Lord Temple, in red coat faced with black velvet, stands with his hand on the shoulder of his little son, who is posed on a table. The countess, in white gown and powdered hair, is seated on his left, a notebook and pencil in her hand, and gazing intently at her little boy whose portrait she is evidently about to sketch. On the right of the group a black page half crouches, supporting the boy with his arms. This picture, which was painted when Reynolds was still something of an experimentalist and before his esthetic judgment had led him to the policy of keeping all else subsidiary to the artistic unity of the design, strikes one as being a little overloaded. The illustrative element has been allowed to disturb the harmony of the group, and the canvas is too crowded for pictorial success. The result is a certain artificiality and stiffness in the arrangement of the figures, which have a somewhat detached air.

In the same room with this work are four other canvases by Reynolds of a very different type—the famous caricatures done by him when at Rome, including his parody of Raphael's "School of Athens," in which over a score of notabilities of the time, then residing at Rome, and including several well-known Irishmen, are represented. Amongst the personages who may be recognised in this group of figures are Mr. Henry of Straffan, the first Earl of Milltown, Mr. Maxwell, the Abbé du Bois, Mr. Phelps, the Earls of Charlemont, Mayo and Cassilis, and the painter himself. In another caricature the Earl of Milltown and the first Earl of Mayo are shown. The latter, who was nicknamed "Killjoy Lord Naas," was regarded as a bore by his friends, hence the rhyme:—

For who the devil, I should like to know,  
Would sit and be bored by Lord Mayo;  
And who on earth, except his nurse;  
For Lord Mountcashell cares one curse?

In yet another of these curious jests in paint the ninth Earl of Cassilis, the first Earl of Charlemont, Mr. Ward and Mr. Phelps are shown, each wearing the national emblem of his country. All of these canvases are in almost perfect condition, quite free from any darkening or cracking of the surfaces. They are painted with a frankness and simplicity of treatment which is in marked contrast to the "faded" colour of Sir Joshua's later work, and mark a phase in the development of his art of which few records have come down to us. The portraits of Charles, fifth Earl of Harrington, the friend of Lord Byron, by Powell, after Reynolds, and that of the first Earl of Milltown, by Pompeo Battoni, will also be noticed; in the latter is an excellent example of that painter's work.

More interesting, however, to most visitors will be the series of heads in pastel by Rosalba, and the three French pictures of the Watteau type which hang in the first room. These latter are probably from the brush of Watteau's pupil, Jean Baptiste Pater, who imitated his master in the painting of those fêtes galantes in which so much of the mingled frivolity and sentiment of the prerevolution period is embodied. The difficulty of disentangling the best work of Pater from the weakest of Watteau is easily accounted for by the fact that before his master's death Pater painted daily under his supervision, and was inspired by his intimate contact with Watteau's ideals to something of the charm and grace of the poet-painter. Pater's colour is better than his drawing, which latter lacks the precision and brilliancy of Watteau. The smallest of the three canvases in the Milltown collection—a fête galante in a camp—is a charming little composition full of delicacy and even and brilliant in tone. The other two are hardly such good examples of his work, but all are interesting acquisitions, especially in a gallery in which the French schools are as yet incompletely represented. The most famous series of Pater's paintings is in the Royal Prussian palaces at Potsdam. The Wallace collection also includes a dozen delightful examples of his art, and characteristic Paters are also to be found in the Louvre, Buckingham Palace and the National Gallery of Scotland.

Just over the three Paters in the Milltown collection hang two fine examples of the art of Panini—an Italian painter who worked in the first half of the eighteenth century, and who specially devoted himself to painting the architectural remains of ancient Rome. There are four Paninis in the collection, all of this type and a

mirable of their kind. In one the Coliseum is shown, in other the Forum, and the other two represent ruined buildings, with figures and landscape. The designs are careful and the grouping shows taste and a feeling for balance. On the same wall with the Paninis hangs a small painting by Peters, the seventeenth-century Dutch sea-painter, representing a Dutch war vessel which has just cast anchor, giving a salute and hauling down her mainsail. It is a pleasant little composition, and the colour and chiaroscuro both admirable.

The six heads by Rosalba Carriera in this room are resting and delightful examples of the work of a painter who had few, if any, rivals in her own particular line. Rosalba Carriera was born in Venice in 1675. In 1705 she was elected a member of the Academy of St. Luke, Rome and in 1720 of the Academy of Bologna. In the same year she went to Paris where she painted Louis XV., then a boy of ten, the Regent and many of the nobles and ladies of the Court. Her first portraits were done in oils, but it is her miniatures, and above all her crayon portraits, which have won her fame. A friend of Watteau, Largillière and the other Court painters of the period, the brilliant society of the Regency lives in these delicately-tinted pastel heads, in which the tenderness and delicacy of a feminine temperament found its expression. Rosalba's strength lay in the fact that she did not try to rival the male portrait-painters of her day, but to express herself. We may smile now at these "mannered" heads, whose dainty artificiality of pose and treatment is apparent in every line, but they charm us nevertheless. They are a selection from a past age—an age of studied poses and studied grace. The stateliness of the *ancien régime* is reflected in these faint-toned canvases, and we pardon their faulty posing for their charm and tenderness. Most of Rosalba's works are in the Dresden Gallery, including her *chef d'œuvre*, a head of Metastasio; while in Paris there are five of her works, amongst them the half-length crayon drawing of a woman crowned with laurel, which she presented to the Academy on her election to the Royal Academy of Painters. Attention should be drawn to the two landscapes by Goussier, the contemporary of Reynolds, and to the fine landscape by Smith of Chichester. A charming little *pastel* sketch of a boy, which is apparently by John Russell or Daniel Gardiner, is also worthy of notice. The selection of silver, to many people the most interesting part of the collection, we must leave for another article.

In the two inner rooms but little of interest will be found, and it is to be regretted that it was not possible, under the terms of the gift, to make a selection from the collection, and to exclude those works which are obviously unworthy of the traditions of the gallery.

#### MORE CHURCH LIBRARY.

ACCORDING to the Rev. W. G. Clark-Maxwell, M.A., F.S.A., in the tower of the church of More, near Bishop's Castle, are preserved some 250 volumes presented to the parish in 1680 by Richard More, of Linley, with the object of "teaching the minister sound doctrine." The deed establishing the library is probably still in existence, though its present whereabouts is unknown. Directions were given that the books should be kept in the church and read there, and should not be taken out of the church by anyone except Richard More himself, he reserving to himself the right to lend out any of the books for a period not exceeding a month at a time. Richard More presented not only the books, but the presses in which to keep them, probably the same as still exist for that purpose, though evidently altered and (apparently) broken down. There have been made, at different times, if not more catalogues of the books, fragments of which, once pasted to the inner sides of the press doors, were found at the bottom of the shelves; but one cannot definitely pronounce that even the older of these is as early as 1680. In the catalogue lately printed an attempt was made to reproduce the old classification, but the traces of it were found to be too fragmentary and indistinct to be of any use as a guide, and therefore the arrangement adopted has been a purely chronological, the books being set down in the order of the date of their printing, with notes where required of their former owner, &c.

There do not appear to be any books of special rarity in the collection, but a number of considerable interest, the principal among which may perhaps be reckoned part of the Sarum Breviary, printed at Antwerp in 1525. There are also now on the shelves copies of the 1611 Bible, of

Erasmus's "Paraphrase" and Jewel's "Apology and Answer to Harding," but the first was certainly, and the others probably, part of the necessary outfit of every church. The same remark applies to the 1776 Prayer Book, which cannot, of course, have formed part of the original collection. Amongst the names of the former owners of the volumes, those of most frequent occurrence are Thos. Pierson and Christopher Harvey, the latter in a very beautiful handwriting, and usually in the formula, familiar to us from its use by Grolier, "Chr. Harvey et amicorum." Thomas Pierson was, no doubt, "the famous Mr. Pieron, of Brampton Bryan, the founder of lectures in these parts," as the biographer of Gualter Stephens, incumbent for fifty-three years of Bishop's Castle, styles him. These two clergymen, with Thomas Froyssell, minister of Clun, Sir Robert Harley of Brampton Bryan, Richard More of More (the grandfather of the donor of the library), and in a less degree Humphrey Walcot of Walcot, were staunch upholders of the Puritan way of thinking, and it is easy to understand how some of Pierson's books came into More's possession. Concerning Christopher Harvey, we learn from the article in the "Dictionary of National Biography" that he was a poet and author of "The Synagogue," verses in imitation of George Herbert's "Temple," and printed in some editions of that work. We also find that he published in 1647 an edition of Thomas Pierson's "Excellent Encouragements against Afflictions." It seems a probable conjecture that Harvey acquired some of Pierson's books, and that from him they passed, with some of his own, to Richard More. It is quite possible that some of the earlier printed books formed part of the possessions of the dissolved Augustinian Priory of Chirbury, though direct evidence on this point is not forthcoming. This would apply more specially to the Commentaries of Haymo, which we know were directed to be read during meal times in the houses of Austin canons. The purpose assigned for the donation of the library being "to teach the minister sound doctrine," there is a laudable diversity in the theological position of the authors included; not only Calvin and Beza, but Jerome, Thomas Aquinas, Melchior Cano, Jewel, Arminius and Chillingworth find themselves in company on the shelves, and it argues much for Mr. Richard More's confidence in security of his theological position, as well as in the discretion of the ministers of More, that he should have included controversial works on the Roman side, if indeed he was aware of their contents. The books are now well cared for, but have in some instances suffered formerly from damp.

#### THE ORGAN, LICHFIELD CATHEDRAL.

THREE years ago the Dean and Chapter, having through the liberality of the diocese been enabled to put the fabric of the cathedral in thorough repair, and having largely added to its beauty, without and within, passed a resolution both to move and enlarge the organ, so that nothing may be wanting to make the services musically as perfect as possible. One of the chief reasons for which cathedrals were saved at the Reformation was the maintenance of the highest type of a musical service. It has long been recognised that it would be hopeless to attempt any improvement in the present unsatisfactory position of the organ. To solve the question of what is the best position they have obtained and weighed carefully the opinions of architects and the best musical experts in England who know the cathedral well and have had opportunities of judging, and, further, being pressed by a very urgent petition from the organist and vicars choral that the organ may be placed in proximity to the singers, and in an elevated position, they have decided to proceed in accordance therewith; and the Dean has undertaken by his own personal efforts to raise the funds required beyond what the Dean and Chapter can afford out of their savings.

The reasons for their decisions as given below will, it is believed, be accepted as a complete justification:—

1. To have the present organ entirely reconstructed.
2. To move it from the ground floor to an elevated position in the triforium, and thus bring it near to and above the singers.
3. To enlarge it by the addition of a considerable number of new stops, some of them very important and costly.
4. To have new mechanism throughout, new pedals, blowing apparatus, console and "such other accessories as are found in the best modern instruments."
5. To adapt the construction of two bays of the triforium and clerestory behind the chapter-house for its reception.

No tracery will be removed from the windows in the chancel, only the glass from two and the lower part of the mullions of one for the exit of the sound.

The chief organists of England have been consulted by the Dean and Chapter, and there is absolutely unanimous and overwhelming evidence in favour of the proposal. The organ is now placed in a side chapel of the north transept, round a corner, isolated at a distance from the singers, where the sound is obstructed by some massive stone pillars, and also unevenly and only partially diffused over the cathedral owing to the peculiar position of the pipes.

Sir George Martin, of St. Paul's Cathedral, says:—"The tone of the organ should pervade the whole building, not (as at present) only part of it."

Sir Frederick Bridge, of Westminster Abbey:—"The present position of the organ is very bad. I have played on it myself and also heard it. It is a wretched arrangement."

Dr. Monk, of Truro Cathedral:—"The present position of your organ is really preposterous. I heartily hope it may be moved very soon."

Dr. Sinclair, of Hereford Cathedral:—"The present is almost as bad a position from a musical point of view as it well can be."

Sir G. Martin adopted the new site from Truro Cathedral, chosen by Mr. Pearson, in advising on the position of the fine organ to be put in St. Patrick's Cathedral, Dublin, and himself superintended all the arrangements. He has assured us that "nothing could be better; it is a great success every way."

Sir F. Ouseley and Sir J. Stainer both strongly advocated the same position.

Dr. Monk:—"Without doubt the very best place for it."

Dr. Perrin, of Canterbury Cathedral:—"The new position will be splendid."

At the restoration in 1856 Sir Gilbert Scott, when the old organ was removed from the screen to throw the nave and choir together, proposed to erect it in the triforium, but unfortunately his advice was not accepted, and the organ was stowed away in a vacant chapel on the ground floor which was then unused and seemed ready to hand. The late Mr. Pearson, architect, advocated the triforium as the best position; and Mr. Oldrid Scott, architect to Ely, Lichfield and several other cathedrals, does the same. The triforium or clerestory site is adopted for eleven of our cathedral organs, and most of the others are raised on the screen, *i.e.* above the singers. The Dean and Chapter are assured that if they can raise the funds to carry out these improvements and make the additions, they will have "an instrument in tone, mechanism and position equal to almost any church organ in England." Yet further, the removal of the organ will set free for use a chapel of considerable dimensions and beauty now completely hidden, and make the north transept available for worshippers, instead of being, as it is, practically disused in service owing to the close proximity of the instrument. The Dean has been making private appeals to the wealthier laity of the diocese, whom he knows to be specially interested in the beautiful cathedral, and, as on previous occasions, with considerable success. As yet he has not appealed to the citizens, being anxious not to interfere with local claims now before them, such as the Johnson memorial and St. Mary's organ fund; but if he is obliged to do so later, he has no doubt of their ready help. The cost of the work, which is to be completed in June 1908, is estimated at about 4,000*l.*

### GENERAL.

**The Design** by Mr. H. P. Burke-Downing has been placed first in the competition for the school in Pelham Road, South Wimbledon. A design by Mr. C. Harrison Townsend was placed second and one by Mr. A. H. Ryan-Tenison third. Mr. J. W. Simpson was assessor.

**Mr. John Singer Sargent, R.A.**, of 31 Tate Street, S.W., was struck off the voting lists on the ground that he was an alien at the Chelsea Revision Court. The Conservatives made the objection. It was stated that an old servant had given a canvasser information to the effect that his master was an American and had never been naturalised.

**The Chartered Surveyors' Golfing Society** announce their annual dinner at the Trocadéro Restaurant on Monday, October 21, at 6.30 P.M. The chair will be occupied by Mr. George Langridge, president of the Society. Mr. Sydney

A. Smith, of 22 Chancery Lane, London, W.C., is secretary.

**The Magistrates** at Keswick have inflicted a fine on a vandal who had chipped his surname in 6-inch letters upon one of the stones in the inner ring of the Ducal Circle, Keswick, which is a scheduled "monument" under the Ancient Monuments Protection Act. The name has been effaced.

**The Work** of excavating the large tumulus at near Stoke Courcy, Somerset, has been completed, and it is reported that among the discoveries made were contracted interments of the Early Bronze age, accompanied by typical earthenware drinking vessels in two cases by well-made flint implements. Of a central interment, which should have been found on the clay surrounded by a wall, no traces were discovered but scattered bones, but this absence was fully compensated for by the interesting and hitherto unrecorded history of the disturbance had been due to the Romans, who had an unmistakable record of their presence in a typical interment of pottery and a coin of a later emperor.

**The Campanile of Venice** is emerging from its present state. Substantial progress has been made during the past few months, and the new tower now stands nearly 40 metres high. Construction goes on at the rate of about 48 inches per week, and it is estimated that the work will be completed in two years.

**The Ancient Parish Church** of Blandford St. Mary has been for the first time illuminated with lamps. During the last two or three centuries it has been illuminated by candlelight, and consequently no evening services have been possible during the winter months.

**The Carnegie Physics Laboratory**, in connection with Dundee University College, has been commenced. Sir James Anderson, LL.D., is the architect, and the building will cost 12,500*l.*

**Rochester Corporation** have had an offer from Mr. P. Fitzgerald to present, for erection in the High Street, a statue in bronze of Charles Dickens. The Council has decided that the consideration of the matter must stand over for the present owing to the construction of tramways.

**Mr. Scobie**, architect, Dunfermline, was present at the Lochgelly Town Council meeting and discussed plans for the new municipal buildings. The plans were approved, and Mr. Scobie was instructed to have the specifications prepared as soon as possible to allow of the estimates being sent in and the work gone on with.

**The Sea Defence Committee** of the Lowestoft Town Council in their annual report state that they had expended 867*l.* 19*s.* 9*d.* out of an estimate of 933*l.* 16*s.* 2*d.* The following estimate of amounts required by the committee for the half-year ending March 31, 1908, was considered and approved, and referred to the finance and rating committee:—Groynes, north and south beach 100*l.*; maintenance of outfall, 50*l.*; repairing wall, decking slopes, carting soil and repairs to south slopes, 150*l.*; temporary protective works—south beach, north beach and filling-up beach revetment, 200*l.*; miscellaneous (cost of conference), 10*l.*; excess expenditure on capital accounts over sanctions to be defrayed out of revenue proportions for this period, 300*l.* 81*l.* Less surplus, 65*l.* 16*s.* 5*d.*; amount required, 744*l.* 3*s.* 7*d.* The assistant surveyor reported levels to south beach to August 16, showing the beach in about the same condition as the last report.

**The Holly Lodge Estate**, Highgate, the world-famous summer residence of the late Baroness Burdett-Coutts, which is announced to be sold by auction on the 24th proximo by Mr. Joseph Stower, comprises altogether an area of about sixty acres, including eighteen old-fashioned houses with gardens, nursery ground and other premises. The residence, standing practically on the summit of Highgate Hill, is a substantial structure of the Georgian period, with elevations finished in painted cementwork, three storeys in height above the ground.

**Mr. W. H. Peacock**, manager of the Grand Opera House, Harrogate, and the Opera House, York, has completed arrangements for the purchase of the Scarborough Hippodrome, and it is his intention to remodel the existing building and to provide an up-to-date theatre to accommodate 2,000 persons. The theatre will be one of the best in the town.

## THE WEEK.

It was pointed out already that the County Council had arranged to grant leases of parts of the site at which had been purchased solely for the use of the new county hall. The arrangement necessarily affects the designs prepared for the site, and we suggested that information should be fully conveyed to the competitors of any alteration of the Council's views. There are rumours abroad that other modifications will become essential. In view of it is doubtful whether any of the designs are now under the consideration of the assessors for any practical use. The competition will then be more than a mere academical one; although from the character of the designs an effort will be made to choose those which suggest that under more definite plans the authors would have produced a satisfactory design. Another preliminary competition under conditions might be expensive. But it would be better to making competitors suffer loss because the Council did not agree in all things with their proposals.

It was not agreeable for the people of Edinburgh to have an additional twopence in the pound to meet the increased expenditure, but what is less satisfactory is that an increase arises from a cessation of the efforts to the extent of the city. In spite of its interest, its beauty and picturesque, Edinburgh is not a large town. Many among the population consist of the students and relatives of students who are attracted to the city by the reputation of the University, the other schools. But the efforts to provide educational institutions in England must have the effect of keeping families in the south who, under the present conditions, would have temporarily emigrated to the north.

It was pointed out by the treasurer of the County Council that between 1897-8 and 1907-8 the population of the city has gone up 50 per cent., from 1897 to 418,000. In 1907; whereas the rental increased only 24 per cent., from £1,749,000 in 1897 to £2,749,000 in 1907. The increase in rental has been very much smaller in the second period of ten years than in the first. In the first, that is, between 1897 and 1902, it was 16 per cent. In the second half, between 1902 and 1907, it is only 7 per cent.

BUCKINGHAM Burton-on-Trent has gained an universal reputation by its beer and has a history which goes back thousands of years, the town does not appear to be mentioned by the Herald's College, and is without heraldic bearings. The deprivation has not affected the town of Burton, but of late years a grievance has been put out of the subject. In BURKE's "General and in DEBRET's "House of Commons" are given three wavy of six argent and azure, on a chief a pale displayed between two fleur-de-lys or." Corporation note-paper a motto is added, "Honor Alit Artes," but the arms are there "Azure three bars wavy argent" on a chief. This of course is colour upon colour and a heraldic law. The escutcheon is also surmounted by a mural coronet borne after the manner of a duke's rank. This is a piece of absurdity which is highly deprecated. It appears that in a coat of arms of Burton is represented, but is not identical with those of Newark no value to it. There is never much difficulty for an architect or a town in acquiring such an embellishment simply a question of fees. The Burton Council, being unable to realise any connection with the arms and manufactures, have declined to

negotiate with the officers of the red brick building in Queen Victoria Street. But a new spirit has arisen, and it could easily be gratified if some of the wealthy townsmen would undertake to pay the fees which are necessary.

IMPARTIAL travellers who are able to compare English and German towns in Africa give preference to the latter. It is flattering to our national conceit to believe the Germans lack our gift of colonising. But when clean streets and well-designed houses are found in regions which a few years previous were wildernesses, it must be admitted that the Germans can produce results which show an approach to civilisation. The police are well drilled, and it is startling to see a number of dusky musicians on a bandstand attempting German compositions. The new English towns suggest that we believe in developing individuality, and it generally displays itself in patronising shanties where intoxicants are sold at amazing prices. The official report to the Colonial Office from Uganda indicates that the Germans have in those matters a foresight which in English traders is wanting. Germany, we are told, is cutting out Manchester in coloured cloth, and this is due to want of organisation. There is no British wholesale house in Uganda. Orders are in consequence freely given to Germans, and in that way they capture the markets. The absence of a British bank is likewise remarkable. There are demands for British corrugated iron. Nevertheless the stock always appears to be sold out, not only at Uganda, but at Mombasa and Zanzibar. The same state of things presumably prevails in other trades. Probably the German Colonial Office promotes trade in various ways besides issuing documents. However it is accomplished, the success of our rivals is depressing to those among us who are not cosmopolites.

A PAPER on "The Evil and Peril of Cheap Tendering" was read by Mr. W. MAJOR before the convention of Master House Painters and Decorators. He contended that the principle which has resulted in the fair-wage clause for workmen should be recognised when local authorities deal with master painters. Public opinion, he thought, could be utilised for the prevention of tenders which are too cheap, and it was suggested that if lists of tenders were more generally published reputable tradesmen would hesitate about being found in the lowest places. Painting is a complex operation, to which good materials and good workmanship are essential if it is to be successful. It is very possible to deceive people by painting, for at first good and bad work may be easily confounded. The test of time is, however, crucial, and local authorities as well as individuals may be assured that cheap paints, owing to their excessive adulteration, cannot resist the atmospheric effects of this country.

THE French are generally considered to be most accurate in the character of the scenery and properties for every important drama or opera. But one of the professors of the Conservatoire has just pointed out that whenever "Faust" is represented in the Opera House the scenery depicts Renaissance buildings, whereas all the surroundings of FAUST should be in the Gothic style. He is astonished that during all the years in which GOUNOD's work has been performed no architect or archaeologist has protested against the inaccuracy of the scenes. As the Opera House lately changed directors the Professor thinks the time is opportune for a change. GOETHE certainly indicates the character of the scenery. FAUST is first seen in a lofty, vaulted, narrow Gothic chamber. The cathedral is likewise Gothic. But the street scenes should no doubt show signs of the Renaissance, for apparently the time selected was that when Mediævalism was being supplanted by the new learning. In England the buildings are generally suggestive of Gothic.

ved and let in to a new slab of marble, but in way that the shoulders of the goddess appeared horizontal. After several years there was a sus of opinion among sculptors that the figure originally posed in a different way. A slight change de, and we now see that by slightly tilting one e shoulders, the breasts, the drapery have all a ism which is not to be seen in early casts or aphs of the statue.

ther question then arose which, after many discussion, remains unsettled. What kind of was represented? Greek sculptors adhered to types of gods and goddesses. QUATREMÈRE DE maintained that the figure made part of a group VENUS was disarming the war god. Others upposed, Comte DE CLERAC being the earliest them, that the goddess held in her hand the which she received from PARIS; and hence we er that the *Venus* of the Louvre inspired the cent and tinted *Venus* of JOHN GIBSON. It has rthermore concluded that the figure was allied acient VENUS who was represented as inscribing es of heroes or the record of some victory on a which was partly supported by her knee. The ations are very varied. In such a case we y inquire what was the appearance of the statue was discovered.

was to be expected in a time of excitement, when ch officials were afraid that some malicious and d Turk would arise at any moment and deprive treasure trove of marvellous value, it was not e that an accurate account of what they saw be given. TENNYSON introduced one of his ems with a prose note in which he said it was rd to describe a statue in verse, and all who ied will admit the difficulty of suggesting the r of one by a few lines of prose. LOUIS me years after he saw the statue said that st found there was a left arm which was out- d, while the right arm was close to the side and the drapery. BREST'S son said that his father told him that only the left arm remained when the as unearthed, and that it was slightly raised with e in the hand. The son of the finder declared like- at the left arm was outstretched and the hand apple. D'URVILLE, who would appear to be t intelligent of the early witnesses, in a report a year after the discovery, said the left hand was nd held an apple, while the right supported the

A brother officer stated that the left arm was as if to show the apple, while the right was broken bow. In a later account by the last he stated that as were broken. It afterwards came out that an arm and a mutilated hand with an apple was i the niche or enclosure which contained the The fragments were exhibited before a meeting cadémie des Inscriptions, and it was concluded y could not have belonged to the statue in its state. It is also curious that in the early of the scrimmage between the French sailors slanders the arm was said to be lost, and the t is corroborated by MELIARAKES. We may say that the original positions of the arms e ascertained, nor can it be said that they were ted on after the arrival of the statue at the

supposed that an apple was a symbol of Melos. gely the island might be suggested by a woman one. Occasionally on coins there are typical cities, which are appropriate enough for money to pass through the hands of strangers. it is doubtful whether examples are known of hich stood for cities, islands, or countries. a well-known reclining figure known as *The* it is a Romano-Greek work and was pos- ough at the command of some patron who that the boundaries of sculpture should be

The figure found in Melos differs from the

majority of the statues of VENUS, and is suggestive of qualities which that goddess was not supposed to possess. Whether it represents the nymph MELO, as was presumed by EMÉRIC DAVID, or stands for womankind in general, are questions which appear to be impossible to solve. It is evident from the latest account of MELIARAKES that at the time of its discovery no tradition about its meaning had survived, and the peasant who discovered it and sold it to the French was as wise as one of the French Academicians. Perhaps, after all, it is best to consider the statue, like HEINRICH HEINE, as the ever-blessed Goddess of Beauty, the beloved Lady of Melo, who appears to look disconsolately on her devotees as if saying to them, "Do you not see I have no arms and am unable to help you?"

### THE VALUATION OF BUILDING ESTATES.\*

THE Geological Society celebrates its centenary this week. In the history of its early days which was compiled for the occasion a prominent place should be given to what was done towards demonstrating the utility of the science by RICHARD GRIFFITH. WILLIAM SMITH, who was the father of English geology, was able to prepare a geological map of England and Wales from his own observations through the country. GRIFFITH, on the other hand, had the command of a large number of surveyors, and from their observations he produced a map of Ireland on a large scale, or what was thought so at the time. It does not correspond with the later maps of the Geological Survey, but with a science like geology it is almost inevitable to have a difference of opinion with regard to the extent of formations. It is not, however, for his map RICHARD GRIFFITH should be remembered, but for demonstrating that geology can become an aid towards determining the value of land, and in that way could help to solve the terrible rent problem of Ireland.

Every surveyor and land agent knows how closely rent is connected with the various kinds of illegal agitation among the Irish, and with the crimes which are the results. In many parts of the country land was let at a rent which a farmer could not pay unless he supplemented his labour on it by employment of another kind. A tenant who was accepted for a farm soon grew discontented, for he discovered he was less free than an ordinary labourer. And yet his selection created a host of enemies who were envious of his success. As far back as 1824 a Royal Commission decided that it was indispensable to have a fixed and uniform system of valuation throughout Ireland, and that the work should be done under a Government department. The necessity was so obvious there could be little opposition. A valuation department was created, and RICHARD GRIFFITH was placed at the head of it.

It should be remembered that in those days geology was in its infancy. Students were attracted by the great phenomena of the oldest formations, and the most interesting surface of the earth, which was representative of comparatively modern agencies, was neglected. GRIFFITH had, therefore, little help from the SEDGWICKS and MURCHISONS when he arranged soils in four divisions, viz. clayey, sandy, limey, peaty. They were subdivided into other classes, and for the qualities of soils certain terms were fixed which were clearly defined, such as stiff, friable, cold, warm, &c. The colours had also to be described, and other characteristics. In order to arrive at the valuation a scale of prices was fixed for ordinary produce.

At first the valuation applied only to the collection of fields known as townlands. But as the organisation

\* *Tabular Aids to Valuation.* For Ascertaining the Purchase Price of Building Estates; Percentage required to cover Interest and Sinking Fund; Cost of Buildings; Deductions for Maintenance; Comparative Site Values, &c. By G. Tyrrell McCaw, B.A.I., M.A. (Dublin), and F. Oliver Lyons, B.A.I., M.A., General Valuation Office, Ireland. (London: Crosby Lockwood & Son.)

developed the valuation of the different farms or tenements throughout the country was arranged. Owing to the existence of the Ordnance Survey maps, the cost of the valuation department was much less than might be imagined. The results were employed for more purposes than were anticipated. When the Encumbered Estates Act came into operation, the special valuations for which liberal prices were given were generally based on the figures of the Government valuation, or, in other words, a large percentage was added to GRIFFITH'S returns, and that was supposed to represent the true rental value. In many instances investors found that the increased figures were not trustworthy, and the endeavours to obtain rents corresponding with them became a new source of trouble. Every case relating to property which goes before an arbitrator in England demonstrates the difficulty of getting experts to agree upon the value of a building or of a few fields. It is, therefore, not strange that the figures of the Irish Valuation Office should often be disputed. But as the amounts have been ascertained by a scientific system, they are maintained in spite of all opposition, to an extent that is almost incredible with such operations.

It is easy to see in the small work by Messrs. McCaw and Lyons the influence of the Government system in their effort to avoid empiricism as much as possible. In the introductory paragraphs to their tables they say:—

In practically all cases of estimation of value, experience is the only guide. Experience, however, is based on a collection of carefully ascertained facts, and the correct co-ordination of these facts with the new problem to be solved constitutes the skill of the expert. In numerous classes of cases the variations are so great that anything like an actual record of average examples is quite outside the limits of possibility. In other classes, especially where numerous instances occur involving the same principle, a collection of average examples may with advantage be prepared. As a rule, this collection is so multifarious that the mental retention of a sufficient number of common cases is a work of great difficulty. Whenever, therefore, a rough rule cannot be invoked, the records should be epitomised, for from their abridgment it may happen that some scheme can be framed which will prove useful in indicating average values under normal conditions. The tabulation of these empirical data may even lead to the adoption of some general rules; but in any case it must increase the efficiency and expedite the labour of the valuer by suggesting figures which gave good results in circumstances similar to those under review.

With a small book of which one-half consists entirely of tables, and where brevity is observed from beginning to end, it would be impossible in a brief notice to do justice to the authors' system. They prefer squares of 100 feet to cubic feet, which they consider can only supply a rough approximate figure, and they maintain that roofing should be dealt with apart. The system is not to be mastered without careful study. But when it is, the tables will be found to save time, or may be used as a check on tables derived from other authorities. Squares of roofing are worked out according to the ratio between rise and span, and circular and segmental roofs are treated. The tables must have taken a long time to compute, and so far as we have tested them they are accurate. It should be mentioned that the ordinary Irish conditions are ignored. For instance, in dealing with maintenance the authors say:—"Where a heritage contains an extensive garden or curtilage, certain sums for fencing, cleaning, &c., are often disbursed by the landlord in keeping the grounds as well as the buildings up to their full letting value." Now it is a general peculiarity of Ireland that the landlord does nothing in the way of maintenance. Indeed, a witness stated before the Richmond Commission that such an official as an estate carpenter was not to be found in any part of the island.

The publishers have made one of their specialties to consist in books which are adapted to surveyors, agents, valuers and others connected with property in

land and buildings. "The Tabular Aids to Valuation" is a useful addition to their collection, and suggests recognition of modern aids in calculation.

## ST. PAUL'S TO-DAY AND THIRTY YEARS AGO

MR. T. FRANCIS BUMPUS, who on Sunday, September 22, entered upon his thirtieth year as a member of the St. Paul's Cathedral Sunday evening service, writes to us as follows:—

I could not forbear recalling last Sunday evening's changes, spiritual, artistic and ritual, that have taken place at St. Paul's during the three *lustra* that have passed over my head since I became a member of the large choir which leads the simple music that forms so characteristic a feature in the Sunday evening services in our cathedral.

In 1878 Dr. Jackson was Bishop of London, William Church was dean, and Claughton, Great Britain (the present venerable dean), Liddon and Lightfoot were present as residentiary. A "great Chapter" as it has been styled. Shuttleworth (who—that heard it called—his magnificent intoning, particularly in the *Surrexit* and the *Preface* in the Eucharistic Office?), Simpson (the gifted succentor, prince among organists and most courteous of librarians), Povah, Webber, Hall, Milman and Russell (the four last-named were with us, though Mr. Russell has since removed to another sphere of duty) were among the minor canons. Stainer was organist, Sir George Martin sub-organist, the choir, thanks to the indefatigable exertion of the former, ably supported by the Chapter, had been reorganised on its present basis. Penrose was surveyor to the cathedral and under his direction the choral fittings had been replaced as we now see them, in 1872.

The grand peal of bells, whose voices floated over the City for the first time on All Saints Day, 1878, was suspended in the north-west campanile, but the choir regards its flooring and sanctuary arrangements, left in an unfinished state, owing to the hurry with which the preparations had to be made to get it ready for the Thanksgiving Day service of February 27, 1872. The nave and transepts had been denuded of the grey paint with which their stonework was bedaubed centuries before, but the choir still retained this disguise. There was some feeble stained glass of Munich manufacture in the apse and other parts, and a commensally colouring, equally feeble, had been made in the vestments at the east end of the choir. Clayton & Bell had just reset the stained glass in the western window of the choir aisle, and two of the great spandrels in the dome received their complement of mosaic decoration—the one of Isaiah and St. Matthew, by Alfred Stevens and the other of St. Paul, by Watts respectively.

The high altar, though of churchlike aspect, was temporarily apparelled, being surmounted by a canopy of textile fabric and flanked by curtains. It bore no trace of the Edwardian ornaments.

The floor of the choir was merely of boards covered with matting, and gaseliers of the ugliest and commonest type lighted this portion of the building. But the choir was illuminated by four half-circles of gas-jets following the lines of the arches opening into the quarter-dome. On great occasions by the ring just below the western gallery, always looked indescribably beautiful at the arrangement bringing out the grand proportions of the *chef-d'œuvre* to their fullest extent.

The "Decoration Scheme" was in abeyance, and the question "shall St. Paul's be adorned?" was one of the burning questions of the day. Still, while much had to be done, Paul's thirty years ago, the grand old cathedral was coming daily more and more the spiritual home of the living faith of a great people after a long period of stagnation and laxity, while some addition—hardly perceived by the majority—was being constantly made to increase the comfort and convenience of the ever increasing number of worshippers and to augment the dignity and beauty of the services.

To recount all the changes that have taken place at St. Paul's within the past thirty years of my official connection with it would require more of your space than I can encroach upon. I cannot, however, refrain from mentioning the restoration of the crypt and the settling of its eastern portion for devotional purposes.

acing of the white marble pavement in the choir and equipment with the present screen, evolved out of the railings to the sanctuary when it was confined to the ; the cleansing of the walls and pillars of paint, the ion of the reredos and side screens, the improvement e sanctuary generally, the mosaic decoration and ed glass, glorious in *ensemble* if not exactly in accord- with the style of Wren's masterpiece ; the formation e Jesus chapel in the long-disused apse, the completion e mosaic pictures in the eight great spandrels of the ; the installation of the electric light, and the several orations made from time to time in the mode of per- ing Divine service. Could that patriotic lady, Miss Hackett—"the choristers' friend," and whose greatest at was St. Paul's and its services—arise from her grave ehold the cathedral of the present day, how her heart d rejoice.

pon all this I mused last Sunday night while waiting e my place in the surpliced throng which, on the e of seven, and headed by the Cross, streamed (in what ave seemed to those placed at a distance in an end- procession) into the now gorgeously decorated and tuously appointed choir.

## THE SILCHESTER EXPLORATIONS.

VERY large party of members of the Hampshire Field Club and Archæological Society recently visited Sil- cher. The hon. secretary, Mr. W. Dale, F.S.A., at the gate pointed out the length, dimensions of the walls e materials used in their construction. Enormous ers of flints were used, and some persons wondered e they came from, but when the Romans were there e building was going on, and all over the valley the ous flints left by denudation were found in millions. stone used in bands between the flints was a flaggy one from the valley of the Kennett. At the offices e works the visitors were received by Mr. Mill enson, F.S.A., director of the excavations, and who, ale said, had given his valuable services for many e, and had thus saved the Society of Antiquaries a vast use.

t. Dale then read a paper on Silchester, of which the wing summary is given in the *Hampshire Advertiser*:— t varying intervals during the last seventeen or eighteen e, as a club, have visited this spot. We have, how- not kept pace with discoveries as they have been , and on every occasion that I can recall there were amongst us who came for the first time. I should not all surprised if such is the case to-day. Even if it is o I am sure none of you will mind if I remind you as y and tersely as I possibly can what is the interest ed to Silchester, and what light the excavations have n upon the Roman occupation of Britain.

at there was a town in Roman Britain called Calleva batum we know from a mention by Ptolemy and the Antonine Itinerary. That is, Calleva of the bates, a Celtic tribe who occupied these parts, and bly had a town inside the irregular earthwork which round this enclosure and is of pre-Roman age. Of storic remains very few have been found. A few y urns have been unearthed, and a Neolithic cel- y may have been brought in. We shall also see to-day e first time a stag's horn pick, exactly similar to those on Neolithic sites, and which were used for excavating from the chalk. That Calleva was identical with the called, in Mediæval times, Silchester, was evident to isible people, as its position agreed with the distances in the Antonine Itinerary as separating it from other nown places. There were those, however, who dis- even this, but the matter fortunately was set at rest a eeks back by the discovery of part of an inscription ing the words "M. CALLEVÆ," which presently ill see.

e life at Calleva must have been singularly unevent- It is not mentioned in history. No legion was ever ed there. Yet, as Mr. Fox once told us, for more o years there was here a municipality governed very like our own municipalities, the people living in com- ve luxury and refinement, speaking Latin and pro- ing several arts and trades. The plan of the town is ar. Inside the prehistoric earthwork the Romans heir wonderful wall, a mile and three-quarters round, o feet thick and averaging 15 to 18 feet in height. rea thus enclosed, amounting to 102 acres, was marked

out chessboard fashion into streets and squares. In dry seasons these streets and insulæ can be seen in the growing crops, and were noticed by Leland nearly 400 years ago.

What happened after the Romans left we do not know. The city was not sacked or destroyed by fire, for scarcely any human remains have been found. On the other hand, there is distinct evidence that the city became impoverished gradually, for when the west gate was explored it was found that, though originally double, it had been partly blocked up by portions of ruined buildings till it became a mere postern, and on more than one rich piece of tessellated pavement were the marks of fires lighted by some wandering herds- man who had come into camp for the night in the ruins of Calleva. Neither Saxon nor Norman came here. Nor were the walls strengthened and used in Mediæval times as at Winchester and other Roman stations. It has simply been left all through the ages to become the happy hunting ground of the explorer, where we can read the life of the Romano-British without any confusing admixture of the relics of later occupants.

Explorations were begun here in 1864 by Mr. Joyce, vicar of Strathfieldsaye, who uncovered the forum and basilica and some houses, and examined the gates. The foundations thus laid bare were not covered up again, and soon became loose rows of stone. The mounds in the centre are his spoil heaps. The work was continued irregularly by Mr. Hilton Price and others, but it was not till 1890 that the Society of Antiquaries commenced the systematic investigation of the whole of this area, which they have continued every year subsequently, and hope this autumn to bring to a successful termination. Each year an able report of the work has been drawn up, and affords a mine of information to those who will study it. In the Reading museum there is a unique collection of pottery and smaller objects found here, and models of most of the principal buildings of which foundations have been traced, with other details, throwing a flood of light on the domestic life of the Romans in Britain.

I have time only to speak of a few of the more important finds of the last seventeen years. The heathen temple you see to-day is the fourth that has been discovered, and points to the fact that Paganism prevailed. The one small solitary Christian church of the basilican type found in 1892 seems to indicate that Christianity existed in the form of dissent. A good deal was made at the time of the important position of this church in the best part of the town near the forum. But the temple just discovered, apparently dedicated to Mars, was close by on the opposite side of the street. The houses were generally of two kinds. In one the rooms were arranged round a courtyard, in the other principally along a corridor. These houses appear to have been confined to Britain and Northern Gaul, and Dr. Haverfield calls them country houses accommodated to the streets of Silchester. There was a good deal of open ground round each house, in which were often found wells with tubs of wood at the bottom, and rubbish pits used as dustholes. At the bottom of one pit was found more than sixty objects of iron—axes, hammers, gouges, chisels, ploughs, coulter, in fact the whole contents of a blacksmith's shop. The rubbish pits were dust- holes and were fertile sources of objects of interest. Many complete pots were recovered entirely by fitting the broken crocks together, for dust holes and pottery have been associated ever since the day when Job sat down on the ash heap and "took him a potsherd to scrape himself withal." An examination by specialists of these rubbish pits has shown us that the Romans kept dogs and cats and horses, that they apparently indulged in cock fighting, and ate the ox, the sheep, the goat, stag, roe and pig. Botanists have found in these pits not only the seeds of weeds of cultivation, but clippings of the box, seeds of a small medlar, and the stones of the sloe, the bullace, the damson and a plum as large as the Orleans, together with the seeds of the fig and grape, which fruits, it is suggested, were not imported, but grown here. A quantity of uncrushed seeds of the opium poppy gave rise to much speculation, but it is fairly certain they were used for sprinkling on the loaves of bread. Bread thus treated is still prepared by the Jews, and an actual loaf so covered was produced in the rooms of the Society of Antiquaries. Seeds of three poisonous plants, the woody nightshade, the deadly nightshade and the hemlock occur plentifully. It is charitably suggested they were employed for the purpose of making cosmetics.

Of the superstructure of the houses we do not know. It is pretty clear from the thickness of the foundation walls that they were sometimes two-storeyed, and were half- timbered or wattle, and daub plaster was used on the walls

and they had windows and employed glass. Roofing tiles occur plentifully, though the abundance of water-plant remains discovered by the botanists show that sedges and reeds were also used for roofing. The heating arrangements of the winter rooms, by means of hypocausts, were very perfect. The floors of such rooms were made hollow, either by channels or heaps of tiles under which the heat passed and also up the sides of the room by hollow box tiles. The stokehole was outside. Other buildings besides houses have been found. It has not been possible to assign a use to all, but some were evidently used for the purpose of dyeing, which appears to have been the staple industry at Calleva.

Portions of mills for grinding the madder roots were found, and a good many separate hearths evidently made for this trade. There were also the remains of a small silver refinery for the purpose of extracting silver from copper and the removal of copper from impure silver by the process known as cupellation.

Two sets of baths have been discovered. One set evidently belonged to a hospitium or guest house. The others were the public baths of the city. These were of such great interest and so complete that they were left open for two years. They have been most admirably and exhaustively described by Mr. St. John Hope. In the drains of these public baths were found a number of remains. I may mention, among the incidental finds, the tombstone on which is written, in ogham characters, that it was set up to Ebiicatus, the son of Muco, and the fine carved head of Jupiter Serapis. An enormous quantity of coins have been found, one of them the interesting coin bearing the inscription "Judea Capta." I have left far more unsaid than I have said, and can only recommend you to spend a day at the Reading museum. I close by mentioning the tile found here about four years back, on which the maker, probably at the end of his day's work, scrawled the solitary word "Satis." That word I now write at the foot of my remarks, and hope before you leave you will all be abundantly satisfied.

Mr. Mill Stephenson pointed out the work done during the present year, particularly referring to one of the insulae near the middle of the town, where there has been uncovered the remains of a small square temple. The ground plan is quite perfect, and shows a podium about 18 inches high and about 36 feet square outside, with a wide entrance on the east and a cella measuring internally 12 feet by 14 feet. The podium is paved with coarse red mosaic, but the floor of the cella has been destroyed. Against the west wall of the cella is the base of a platform about 3 feet broad for the image of the deity, or for the altar. On and about this were found some of the shattered fragments of the image itself, which was about life-size and of stone. In addition there have turned up considerable fragments of at least three inscriptions, cut on thin slabs of Purbeck marble. One of them has about the beginning the word "Marti," which is suggestive of the dedication of a temple to Mars. Another of the inscriptions is perhaps even more important, since it contains the significant word "Callevae," and so places beyond all doubt the identity (which some have long insisted on) of the Roman town at Silchester with the Calleva or Calleva Atrebatum of the seventh, thirteenth, fourteenth and fifteenth stations of the Antonine Itinerary. He also showed that when a small portion of ground not yet touched had been dealt with, the whole of the area within the walls will have been explored, a work which had occupied eighteen years.

#### CONWAY ABBEY CHURCH.

A PARTY of members of the Llandudno Field Club visited Conway on Saturday and were conducted over the church and castle by the rector of Llandudno. He said that Conway was interesting as the place in which the English and the Welsh influences of the Middle Ages met and mingled. When Edward I. returned from the Crusades he found it was necessary that he should subdue the Welsh, and he sent down an army to Conway. There was at Aberconwy, as the place was then called, a Cistercian abbey and an establishment of the monks of that Order. The Cistercians sprang out of the Order of the Benedictines as a protest against the luxury which the latter, owing to their great prosperity, had begun to enjoy. Austerity was the principle of life of the Cistercians, and they adopted simple vestments and silence was their characteristic. Yet this Order, the Puritans of the Middle Ages, possessed throughout Europe as many as 800 abbeys,

including that at Conway. They introduced the monks known as lay brothers, who worked the fields and became expert agriculturists, their industry in time helping to abolish serfdom from the land. Edward fixed upon Conway as the key to the power in his descent upon Wales he determined that it should be fortified, and his first act was to remove the Cistercian abbey completely away to Maenan, twelve miles from the Vale of Conway. He did this for political reasons. It seemed that he acted from no feeling of dislike or enmity, for he preserved to the monks their property and sent them far away in order that they, being in touch with the common people of the country, should not interfere with his purpose. Edward then raised on the site of the old abbey a parochial church, making use of considerable portions of the original building in the new edifice, and therefore planted in the midst of the country, which hitherto seen only churches of the Celtic character, a complete church of the Latin type. Some changes and additions had been made to this church since Edward's time, but practically the structure is now as it existed at the beginning of the fourteenth century.

The party were guided round the church, and the old Conway exhibited the covers of the old "chain Bible" within which now remains but the fragment of one page of the book that they once protected. In the early years of Queen Victoria's reign, it is said, the parish clerk required pages of the volume to the visitors, and one of the churchwardens confessed to the vicar of fifty years ago that he had bought a leaf of the "chain Bible." The alarmed vicar immediately went to look at the book, and found only one leaf remaining. This is now preserved, with the covers, in a safe.

#### COLOUR ON BUILDINGS.

AT the convention in Liverpool of the National Association of Master House Painters a paper was read by Halsey Ricardo, architect, on "The External Application of Colour to Buildings." He advocated a reversion to medieval methods in civic external decorations. For four hundred years, he said, the element of colour decoration had been fading from our streets, leaving first the buildings, lined with white, and then the men's dresses and in the coloured signs of the streets, but nowadays existing merely in the mayor's coach and the sheriff's liveries. Heraldry, in his opinion, furnished the key towards the external use of colour in our buildings. Municipal and other coats-of-arms should appear on the walls of public buildings, and there should be a considerable amount of lettering, which besides being an almost indispensable form of beautiful decoration, should also serve as a useful local information and the names of illustrious citizens. Apart altogether from the picturesque aspect of the matter, there was the question of preserving the external walls against the destructive attacks of city chimneys, and also the hygienic advantages of periodical cleaning. Washing, white or tinted, was an old and approved method, and it would be an immense step if it became the custom annually to lime-white railway stations, the brick and railway cuttings and wherever the smoky locomotives passed. If people did not care to whitewash the town, they might begin upon the gaol. He suggested some what similar periodical and preservative treatment of buildings like Buckingham Palace and Westminster Abbey. Regarding the educational value of colour, he said that the phase seriously affected the younger generation. The people had grown up amidst the dreary monotone of the buildings, and had, mostly, got the idea that it always must be so and must always be, and that their life, external, must be spent amongst dingy surroundings. But don't let them infect their youngsters with that fatalistic doctrine of Colour—and good colour too—was not difficult to obtain. Their advertisements on the hoardings and walls showed that; and what had been found worth doing for so long a purpose as to puff a proprietary article was surely more worth doing when it meant guiding and educating their children during the most impressionable years of their lives. A school should not be a gaunt, austere building, but made as attractive and gay as colour could do it—inside and out. The strain on the attention of the scholars during the hours of lessons might safely be diverted and rested by having pleasant objects on the walls to look at and making the walls themselves humane and companionable by colour decoration. The children in the East of Europe, and still more so throughout Asia, grew up amidst bright surroundings. Their schools, their mosques,

...ples, wherein they were taught, were the repositories of the finest efforts in colour and coloured ornament, and the result was that the children, under those conditions of healthy eye education—conditions at which they could command in England were they persuaded to do so—grew up more alert and more tractable than ours, and had to struggle with squalor and grim pedantry. There is no sin in bright colour, although it was shunned by any proper people. There was no safety to morals in rooms of drab and mud. Bad taste might be committed and indulged more easily by the timid and ignorant use of low colours than by the courageous attempt to have full ones, and the failure was the more insidious and far reaching because the sillianimity passed for prudence, and naturally, giving no one any sort of satisfaction, must be ranked therefore with the true and counted as such, since virtue (so the sour creed was of its own nature an uncomfortable effort and its reward. They had learnt from some of the modern masters how to deal with colour broadly; let them use that knowledge as a stepping-stone to deal with colour on large faces—not treating their efforts as necessarily monumental or imperishable, but recognising the conditions of use and their material. Then there would grow up a school of house painters and a tradition how the paint could be spread, and in course of time they might hope, in confidence, to see their streets and public buildings looking fresh, clean and cheerful, and, it might be, beautiful.

Mr. J. H. Sibthorpe said that Mr. Ricardo's illustrative allusions to the use of lime-white must, no doubt, be taken as a finger-post pointing in the direction decorators should go. Personally he favoured a colour treatment of the great masses of the face of buildings, and thought architects had erred in lavishing their attention on the border lines rather than on the spaces of buildings. He thought the painting of a man's coat-of-arms outside his house would be neither good taste nor good art. He suggested that our manufacturers should produce some protective finish which, while preserving the decorative colours beneath, would be easily and cheaply renewable from time to time.

Mr. Edmund Kirby (president of the Liverpool Architectural Society) feared that public sentiment would be against covering our abbeys and cathedrals and similar buildings with paint or limewash.

Mr. Orr said that the feeling in Scotland, at any rate, was that it was vandalistic to paint stone buildings.

### QUEEN'S COLLEGE, BELFAST.

ON Friday last the laboratories which have been erected in connection with Queen's College, Belfast, were opened by Sir Otto Jaffe. It was arranged that Lord Kelvin was to perform the ceremony, but, owing to the illness of Lady Kelvin, he was detained in Glasgow. The address which his Lordship intended to deliver was read by his nephew, Mr. James Thompson, and was as follows:—

This is an unique day in University history. I believe I may safely say that never on one day and in one University were seven laboratories opened for scientific instruction and research. The universities of the world are headed by Queen's College, Belfast, in its achievements of to-day. Queen's College, Belfast, is the University of Belfast. The good old honoured name of Queen's College, in memory of our beloved Queen Victoria, will remain for ever with the University of Belfast. But I hope that usage, lawfully participating law, may from to-day forward give to Queen's College, Belfast, provisionally its true name—the University of Belfast. Queen's College is not destined to remain a college of a federated "Queen's University of Ireland," a university which, partly because of its being federal, was never thoroughly and conveniently successful in practice. The University has grown up in Belfast during ninety-five years from the small beginning, about 1815, as the Academical Institution, to the grandeur and completeness in which it now stands forth, fully equipped for all the work of a University. The sooner the University of Belfast is officially proclaimed to be an independent national University the better for Ireland and the better for the world to be benefited by its work. Political antagonisms of all shades of opinion on all subjects may unintentionally conspire to ruin University education in Ireland. They will not succeed. The great development of which the completion is commemorated to-day has come to maturity within six years, from seed planted in 1901 by the Principal Hamilton in his initiation of the Better Equipment Fund. This enterprise has been made a splendid success

by the patriotic liberality of citizens of Belfast and many other well-wishers of Ireland. And now that you have them open ready for use, what are you going to do with them? Your chiefs in the different departments—professors, assistant professors, assistant workers and students—will, I am sure, soon give very good and useful answers to that question. Your seven laboratories extend over the whole field of lifeless matter and of matter associated with life. We may be sure that in none of them will there be any lack of useful occupation. Personally, I need hardly say, I envy most the workers in the laboratories of physics, chemistry and engineering. At the present stage of the era which commenced with Henri Becquerel's discovery of radioactivity in salts of uranium and in metallic uranium, the very thought of physics and chemistry, a now united science, compels us to think of radium in which Madame Curie discovered the element of Becquerel's wonderful radiation. I hope the physical and chemical laboratories of Queen's College, Belfast, will try to find if the radium element does occasionally explode into fragments. If they find that it does, the laboratories will, I trust, hold an official conference with the professors of Greek and logic, and come to a conclusion whether or not it is a convenient fiction to call the radium element an atom. It may remain quite convenient to continue calling radium an element. Indeed, I well remember a time in Belfast when we used to call earth, air, fire and water "the four elements." Whatever may betide, I hope the physical and chemical laboratories of Queen's College will be full of radioactivity until we have more intimate knowledge of radium than we have of iron, with its magnetic quality.

The thought of those early days brings vividly to my mind recollections of the dawn of University history in Belfast. I well remember the joy in the house which my father built for himself in College Square when the news came that King William IV. had conferred on the young Belfast institution (then, if I remember right, about fourteen years old), an honour according to which it became the "Royal Academical Institution" of Belfast. This we may look upon as a first step up towards the dignity of an independent University which we have now in full view. A second step, in which also my father took a keen interest, was the founding of Queen's College, into which, when the institution was about thirty years old, if I remember rightly, its university department was absorbed and made part of the Queen's University of Ireland. I have many happy recollections of Queen's College in the fifties and sixties, when my brother was Professor of Engineering there. What would he not have given for the admirable and useful engineering laboratory of which Queen's College takes possession to-day? I have somewhat later recollections of Queen's College, full of personal and scientific interests, when Thomas Andrews was making his immortal discoveries in it regarding the continuity of the gaseous and liquid states now celebrated throughout the scientific world. I well remember, too, his showing me on a promisingly practical scale of magnitude the electrical transmission of power through a pair of copper wires from one gramme dynamo driven by hand to another taking the work from it. No doubt Andrews showed this to his students at a time when by most engineers and scientific men engineering applications of electro-magnetism were looked on as chimerical fancies of ingenious, non-practical professors or other weak persons. Who can say whether the seed thus sown about 1870 or 1871 or 1872 through University action in the north of Ireland may not have germinated in the Portrush Electric Railway, which has given to Ireland the first historic title to the utilisation of water-power by electric transmission to many miles, instead of to a few yards as shown to the students of Queen's College in Andrews's lecture-room? Flooded with these recollections I need scarcely say that I take a keen personal interest in to-day's commemoration. I warmly thank Principal Hamilton and the authorities of Queen's College for their great kindness in inviting me to take part in it, and I desire to express my deep regret that Lady Kelvin and I are unable to be present.

Professor Hamilton requested Mr. Thompson to accept on behalf of Lord Kelvin a gold key as a token of the regard in which he was held by all connected with Queen's College, Belfast.

Mr. Albert H. Hodge has received a commission to execute three large portrait statues, the subjects being James Watt, Thomas Telford and Henry Bell, for the front of the new Clyde Trust offices in Robertson Street, Glasgow.

## NOTES AND COMMENTS.

AMONG those who regularly visit the galleries of the Louvre there are few who are aware that the great institution possesses a very valuable library. It was formed by order of NAPOLEON, and among the earliest contents were the books which were found in the private libraries of the kings. At no time was it open to every visitor. Admission was only allowed to those who were able to obtain a special permission from one of the Ministers. Under the Third NAPOLEON several select collections were added. Among them were those of VICTOR COUSIN, the Professor of Philosophy, and FIRMIN DIDOT (containing a variety of examples of early printing and other rarities). M. AUDÉOUD, who has bequeathed his fortune for the purchase of paintings, did not forget the library, and has left books, manuscripts and drawings which have a special interest. But so long as the library is a preserve for a few officials the public in general can only indirectly share in the additions. There is, of course, enough to be seen to satisfy any ordinary individual, and as many of the officials are literary men, there must be few works of any value in the library which are not utilised for the ordinary reader.

THE apothecary in "Rob Roy" remarked, "If it werena for hot blood and ill blood what would become of the twa learned faculties?" and when we regard the number of asylums and hospitals which are in course of erection in the country as well as a demand for more capacious law courts we think another learned faculty also profits by human weaknesses. The Edinburgh District Board of Lunacy professed to be somewhat amazed on Monday when they considered the architect's commission on the Bangour Asylum. Mr. HIPPOLYTE BLANC, who has been favoured with so extensive a work, it appeared was paid 8,580*l.*, in addition to 3,000*l.* not included in his account, and there still remained a balance due to him of 2,967*l.* Mr. BLANC was asked by the committee to render a detailed account, which he did. There is, in fact, no mystery in such a case. If a large sum has to be expended on buildings which are indispensable the architect's commission will be proportional to the outlay. It cannot be expected that for a large group of buildings an architect would be content to work for a sum which would be equivalent to what he would receive for an ordinary building. Committees and county councils do not in general believe that the designing of buildings which are or should be plain in character requires much skill. If the Edinburgh Board of Lunacy will inquire they will learn that in England the subject of architects' fees has been several times investigated, and the general conclusion was that any sensible reduction of the commission is not obtainable.

A FORTNIGHT ago an interesting German church was almost totally destroyed by fire. It was founded in the Black Forest, and was known as St. Margen, which was a derivative of the original name, St. Marienzell. A church stood on the site from the beginning of the twelfth century, but by some fatality one after the other succumbed to the flames. The founders were the HOHENBERG family, who wished to rival the ZAHRINGERS, and as the latter favoured the Benedictines the new church was made over to the Augustinian Canons. The district was long troubled by a sort of civil war, and the monks of St. Margen suffered in consequence. In the latter years of the fifteenth century a new monastery was commenced, which was destroyed by fire. In the following century LOUIS XIV., the French king, who had taken possession of Freiburg in 1677, enclosed the site of the church as part of the system of defence by VAUBAN; another and smaller church was erected, but like its predecessors, it was consumed. Next a church was raised in 1716, but on the 12th inst. it also failed to resist the old enemy.

THE French architects are gaining position in America, for it is believed to be preferable to call them directly than to have recourse to American architects, although they may have studied in Paris and call themselves Beaux-Arts architects. Several commissions have been already obtained, and the number will be increased, since M. BOUVARD, the director of works in Paris, has received the appointment of consulting architect for Buenos Ayres. In another field French skill is also about to be invoked. The gardens in connection with the International Exhibition of 1900 are deservedly admired. They were designed by M. VACHEROT, who controls the public gardens of Paris. M. VACHEROT has entered into a partnership with a firm of landscape architects and engineers in New York. He has agreed to spend two months every year in New York. As in M. BOUVARD's case, it will be a very profitable way of taking a holiday. When we consider the admiration which Americans profess for the Old Colonial architecture we think they might occasionally express it by sending missions to English architects or by consultations with them concerning buildings and gardens.

HOUSE, NEAR SHANGHAI, CHINA.

THE art of house-building in the Far East is considerably affected by the climatic conditions of the various ports. In Shanghai one must so arrange one's plan that the occupants may remain comparatively cool in a tropical summer, and at the same time the rooms cosy enough to resist the dispiriting influences of a winter as cold and even more cheerless than that of England.

Under these conditions lofty rooms (sometimes necessarily out of proportion to their length and breadth) and verandahs are insisted upon, and indeed become a necessity—a state of affairs which hardly makes for the æsthetic beauty of a home. Until recently convenient little houses of the type illustrated were practically unknown in Shanghai. They were, however, becoming more and more popular. A colonial, in his love for anything homelike, finds in his villa of red tiles and white rough-cast. The house illustrated has a large semi-basement containing stone wine cellars and kitchen, an extensive block at the rear providing for servants' quarters and stabling. The bedroom has a bath-room communicating with it, the latter being fitted up with all modern accoutrements. It is now being built near Shanghai from designs by Messrs. SMEDLEY, DENHAM & ROSE.

DESIGN FOR CHURCH AND MANSE, WELHOLME ROAD, GRIMSBY.

THIS design was submitted in a competition last February. The scheme comprises a church to accommodate a congregation of 700, a school for 300 scholars and a manse for the minister. The church is so arranged that one can pass from the manse to the schools through the church all under cover. The plan of the church is cruciform with radial seating, keeping the preacher in view from every part of the church. The materials used are red brick facings, with surface decoration of plain tiles. The stone, sparingly used, is red Mansfield, with roof of heavy green Westmorland slates. The clerestory is built in half-timber construction with rough-cast panels. The total cost was estimated at 8,240*l.* The authors of the design are Messrs. A. WINTER ROSE & P. M. STRATTON, A.R.I.B.A., of London.

# THE INVENTION OF THE CORINTHIAN CAPITAL.

SEVENTY years ago an imaginary conversation, ostensibly on the subject of the invention of the Corinthian Order, but which was in reality a defence of invention in architecture, appeared anonymously. It was such as a translation of one of the papyri found in the Vatican Museum, but that was not an uncommon practice in those days. The evidence was too strong of its English origin, and the author was probably George Wightwick, author of the "Palace of Architecture" and other works. It claims the character of his interlocutors by saying:—Callimachus is the reported inventor of the Corinthian capital. With regard to the other interlocutor in the dialogue, history has recorded nothing of him; but whoever he has been he survives in his progeny to the present day. Onophrionus is to be met with in every company and in every age:—

ONOPHRIONUS.—May the immortal gods confound thee, Callimachus, as a traitor to the arts, who, after being educated in their bosom and instructed by their doctrines, dost turnest against them the gifts thou hast received from their hands.

CALLIMACHUS.—You deal in hard words, Onophrionus. I did not think to incur your wrath, even though I did not exactly obtain your approbation. But wherefore do you express so much indignation against me because I have been making an experiment and endeavoured to create a new species of capital that I flatter myself will be allowed to manifest both invention and tolerably good taste?

ONOPHRIONUS.—And can you actually intend that fantastical ornament for the capital of a column? Good taste, Callimachus; really a law ought to be enacted to prevent such experiments as you from playing your freaks and barbarising architecture by the introduction of such intolerable caprices, and such new-fangled devices. I will defy you to point out anything in the least resembling this precious invention.

CALLIMACHUS.—Its want of resemblance to what we have hitherto been accustomed to behold is not necessarily a demerit; quite the reverse, provided the thing be good in itself and adapted to the purpose for which it is designed. Unless, however, you can allege something more reasonable against it, I shall be allowed to consider your objections as dictated by prejudice.

ONOPHRIONUS.—You have the vanity then, forsooth, to imagine that you have all at once struck out of your own mind an entirely new species of capital worthy of being admitted into architecture, and take its place by the side of those antique modes of decoration which have been established by the ancients. I must confess, Callimachus, that I admire your invention.

CALLIMACHUS.—What you have just said is a mere futile evasion. The point in question. My modesty or conceit in the matter is a very secondary consideration; or, rather, you are right to charge me with a fond vanity before you own that what I have originated is faulty in itself and contrary to correct principles of taste. You merely say that it is new; I should now like to have your reasons for regarding it as positively bad.

ONOPHRIONUS.—Were it ever so absurd or extravagant, Callimachus, I do not imagine I should be able to convince you that it is not a masterpiece of excellence—a rare invention that will earn for you never-dying renown. I appeal, however, to common sense.

CALLIMACHUS.—Well then, Onophrionus, fancy me, for once, to be the possessor of that excellent quality. Imagine that I am a comb, Callimachus, to have left us, and that you are an embodied "nous" before you, ready to discuss the matter quite dispassionately.

ONOPHRIONUS.—(Aside.)—This self-satisfied impudence really is altogether intolerable; but I will soon cure him of it. Now, Mr. Common Sense, what is your opinion of this strange odd-looking affair which a certain Callimachus wishes to impose upon us as an original pattern of capital for the capitals of columns? Those in present use, I think, are not good enough for him; oh no! he wishes to abolish the world by something quite new—something entirely his own. Happening, therefore, the other day, to see a basket against which the leaves of some plant were pressed up, spreading themselves around it, he forthwith conceived the notable idea of fashioning it into a capital for the Corinthian order of columns, although it is obviously not adapted to such a purpose; since what can be more preposterous than to place a basket where it would be crushed

by the architrave of the entablature, and to fix a parcel of unmeaning leaves around it? It was indeed very natural for the leaves to grow up accidentally against the basket when it was upon the ground close by the stem of the plant, but how they can be imagined to grow out of the summit of the shaft of the column is past my comprehension.

CAL.—Admirably well argued, Onophrionus. By Jove, I would give something to have that varlet Callimachus to listen to our discourse, that we might enjoy his confusion. Yet hold!—we must admit that, although in the contour of this capital some resemblance may be traced to the general outline of such an object, this neither is nor professes to be a facsimile representation of it. Even you yourself would entertain no apprehension of this solid mass of stone being crushed, or appearing to be crushed, by the architrave above it. I apprehend, too, that the knave will say the foliage cannot possibly be mistaken for real leaves, because, independently of their want of colour to favour such deception, they are so methodically disposed, both individually and as regards each other, as to be evidently mere sculptural embellishment, derived from vegetable forms and regulated by the laws of architectural design; consequently we need not be at all perplexed to account how they can grow in such a situation.

ONOPHRIONUS.—I do not mean to say that this foliage can in fact be mistaken for real leaves; yet notwithstanding that, and however it may flatter the eye by intrinsic elegance of form and by the ingenuity displayed in the whole composition—for I will so far allow it to be not without merit—it offends the judgment. According to you, it is at one and the same time both like and unlike the prototype whence you have derived it.

CAL.—Exactly so: it is sufficiently like to point out its origin, and sufficiently unlike to prevent its appearing a direct imitation instead of a piece of embellishment, the idea of which is taken from what in itself would be inadmissible.

ONOPHRIONUS.—I am glad to hear you make that last confession, because it may spare me the trouble of extorting it from you. Upon what ground, then, can you defend so irrational a practice as that of altering, merely for the sake of novelty, any of the indelible features of our architecture, and substituting for them the chimeras of a fanciful imagination? Architecture totally rejects all such freaks; its laws are immutable. It admits of no other embellishment than what is suggested by propriety, and for which there is an evidently satisfactory reason. It tolerates nothing that is merely arbitrary.

CAL.—I am not exactly sure of that. The principles of architecture are, I grant you, immutable; but there are many of its laws which are altogether arbitrary and conventional, those more especially which relate to embellishment. If you are not disposed to tolerate anything that does not carry with it some appearance of direct utility, or some better apology for itself than being beautiful in its effect and not repugnant to sound taste, I am afraid you cannot be very well satisfied with much that we are now accustomed to admire. Is there nothing arbitrary, I ask, in the practice of channelling the shafts of columns? What obvious meaning or utility, either direct or indirect, is to be discovered in it? You will say that it contributes to variety and beauty; certainly. How again, will you reconcile what you have urged against my capital yonder—namely, that the foliage I have applied to it is an unmeaning embellishment—with your admiration of that which, were it tried by the same rigorous test, and with the same disposition to censure, must be pronounced equally faulty?

ONOPHRIONUS.—Please to explain yourself; for, being no Edipus, I do not pretend to unriddle your words.

CAL.—If my meaning is obscure it is a sign to me that you have a more indulgent eye for long-established caprices than for "new-fangled" ones, which latter alone appear to excite your displeasure. However, that you may not have the advantage of pleading ignorance of what it is I allude to, I request you to inform me what particular propriety there is in decorating the metopes of the Doric frieze with sculpture. Does a structure thereby acquire any fresh accession of strictly architectural character? or is there anything peculiarly flattering to common sense in beholding the figures of men and animals—combatants on foot and horseback—wedged in between the ends of the beams of the roof?

ONOPHRIONUS.—What, then, are you tasteless enough—

CAL.—Not I; you quite mistake me, the reasoning and the objections I am making use of are entirely your own, not mine. You will hardly be so inconsistent as to disown

them now, after having so triumphantly brought them forward a very short while ago by way of convicting me of absurdity.

ONOPH.—But there is a very material difference between the two cases.

CAL.—I am unable to perceive it. If it be contrary to reason to apply foliage to the capital of a column because we are convinced that leaves cannot sprout out there, it should follow as a matter of course that it must be equally so to represent human figures either within the tympanum of a pediment or between the triglyphs of a frieze. I am afraid, Onophrionus, that like many other staunch sticklers for common sense, and nothing but common sense, you suffer yourself to be led by your obstinate overweening attachment to it into the greatest of all absurdities, namely, that of trying matters of mere convention and taste by its rules. Nay, I am not quite sure whether, considering sculptured metopes as mere graphic embellishment to the architecture, they are not liable to some trifling objection on the score of the sculpture not being introduced altogether so properly as it might be. Were I Onophrionus, for instance, I should say that if bas-relief figures are required, it would be better to apply them as distinct compositions of sculpture than to separate them and fit them in between the triglyphs, intermixing them with and crowding the architectural forms on a part whose surface is already sufficiently ornamented by the features appropriated to it.

ONOPH.—Prythee, do not put into my mouth remarks which none but yourself would have the temerity to utter. I am sure they would never have entered into any other head. Still I must own that they are tolerably in character, since the man who has genius enough to improve upon the existing orders of architecture doubtless has that superior delicacy of taste and discernment which enables him to detect faults no one save himself ever dreamt of.

CAL.—The improvement upon which you are pleased to compliment me, Onophrionus, is entirely of your own finding out; I certainly did not flatter myself that I had made the improvement you are so ready to attribute to me.

ONOPH.—But of course you consider your capital an improvement upon that both of the Doric and Ionic order, or do you yourself admit its inferiority, and admitting it, will you still persist in your determination of putting it into execution?

CAL.—Again you mistake me; as little have I admitted its inferiority to the other two species of capitals as I have claimed for it any excellence over them. I shall be very well content should this be allowed to possess sufficient merit in itself and be admitted to equal rank with the others. Surely it will be honour enough to have rivalled, if I have not surpassed them, nay, even to have produced something which, if it at present fall in some degree short of the Doric and Ionic, may in time be improved by others into equal beauty. Much is yet wanting to render it a third distinct order, congruous and consistent in all its parts and impressed with the same character throughout. What I have done is but a mere essay towards the accomplishment of such a purpose.

ONOPH.—A most notable purpose, truly. What a pity it is, Callimachus, that the world has been deprived of your aspiring and inventive genius so long. You should have come into the world some ages earlier, for 'tis now, I fear, too late to think of giving us a new order, we having hitherto been able to do exceedingly well with those we have; and therefore it will be labour to no purpose to attempt to bring another into vogue, especially one that, according to your own confession, is a crude imperfect essay.

CAL.—So in their origin were the orders you now consider inimitable.

ONOPH.—I do not dispute that, but there are limits to architecture; and after perfection has been obtained we must rest contented with it, unless, departing from those standards, we are willing to give ourselves up to all sorts of capricious novelties, whims and fancies. Architecture admits but of two distinct characters—boldness and elegance. Those who brought the art to that perfection which it has now attained were well aware of this; had not such been the case they would undoubtedly have supplied the deficiency. There are, however, some people in the world, Callimachus, who fancy it is reserved for them to discover what it has baffled all preceding experience to attain.

CAL.—Your doctrine, Onophrionus, is certainly a most discreet one, and one which, if acted upon discreetly, would save us poor mortals a great deal of thought and trouble. I am only concerned, for my own sake, that I am unable to

take up with so comfortable a theory, and content with following step by step those who have preceded my profession. In reply, however, to the remark just now made, I must say that I differ from you in asserting that architecture is capable of expressing distinct characters; or, admitting such to be the case, does not follow that there may not be infinite gradations of the same character.

ONOPH.—Well, do we not find such gradations in the two orders we possess? What necessity is there for a third?

CAL.—"Necessity" is not the most appropriate speaking of any of those arts which, however, conduce to the refinement of society and its pleasures, have far outstripped its actual necessities. Perhaps, you merely want to say that you do not think anything would be gained with regard to the art we are now speaking of by imparting to it additional greater compass and flexibility and by permitting a freer range than it has hitherto enjoyed?

ONOPH.—Most assuredly am I of opinion that not. Rather would that freedom and variety which seem so ambitious of procuring for it tend to its decay and finally work its destruction. Do not both reasons and analogy clearly point out to us that it is perfect as it is, and that to alter or add to either of the present orders? In the Doric we have the expression of masculine strength and beauty of the male form; in the Ionic, that of femininity and elegance. Had nature created a third sex, our poets combined the two in the fabulous Erichonius; then indeed we might discover a type for another order, which although neither Doric nor Ionic—that is, neither male nor female—should be conformable to those principles from which architecture may not deviate with impunity.

CAL.—Your imagination is most amusingly personated. To say the truth, there is more fancy in your illustration than in the argument you would elicit from it. I am too, you have appealed to the very worst authority in support of your theory that you could have had reason on your side, and that you have unwittingly opened the door to the most capricious innovations that the wildest imagination could conceive.

ONOPH.—How so, pray?

CAL.—Because the varieties of the human race, individuals in the same nation, are so numerous, that we cannot attempt to express, I will not say all of them, but the principal ones, in the same manner as you seem to do in the two sexes now are, there would be so much latitude in the orders would be subdivided *ad infinitum*. I advise and discard your simile, for however appropriate it may be on a poetical occasion it will prove a most trivial allusion in mere prose.

ONOPH.—Whatever latitude my doctrine might give, I am convinced it could never open the door to such a variety as the specimen you have here produced. This is a mere variety of either of the other orders, but so altogether new.

CAL.—So much the better, then; for I do not think it conform to the doctrine you have laid down. Your fantastic analogies, a column is neither more nor less than a column, and such parts as are merely decorative must always be more or less arbitrary; our chief object, therefore, ought to be that they are suitable in themselves and tastefully combined. With equal propriety might I contend that however they may differ in minor details, only two classes of form ought to be admitted for that columns ought to be so restricted. Instead of this we perceive that an exceedingly great diversity of regards contour, proportions and decoration is admitted for such objects; nor does it appear that the latitude allowed has been productive of any ill consequences. On the contrary, although some are decidedly superior to others, there are few, if any, that can be pronounced positively bad. Nay, what is more, we may frequently perceive an equal degree of merit in those which otherwise exhibit the greatest contrast. Now, I do not mean to say that I admit of a similar degree of variety, except it be in the capital; and there, I think, there is ample room for display of invention and taste.

ONOPH.—Oh! doubtless of all kinds of taste, not the worst imaginable, if every one is to be at liberty to follow an unbounded scope to his particular fancy. Let us allow artists to coin their own expressions without being amenable to any fixed standard or authority, and let them go with impunity to the most extravagant conceits.

—Then of course you take it for granted that all the modes of beauty are already exhausted; that taste henceforth cease to be creative, and that it ought to be itself to working continually with the same stock materials?

PH.—Certainly, if we would preserve it unimpaired from deterioration.

—I, for my part, doubt whether equally fatal consequences would not arise from the timid caution you recommend, as from the temerity against which you are so anxious to guard; since, although we might continue to go on tolerably well for some time with a mere traditionalism of ideas, by being reduced to a passive state, taste would ultimately become inert and deadened, and the things which are the objects of it will lose their original spirit, though their form may be retained. Nay, the satiety that attends an invariable recurrence of precisely the same modes of beauty is, in my opinion, quite as apt to open the way for licentious caprice, as is the allowing oneself some liberty of invention and some exercise of discretion.

PH.—Aye, but if we once remove the wholesome restraint of a definite standard and authority, and leave everything to individual discretion, who is to judge what is right and what is not? This is too much like leaving every man to be his own law-maker.

—By no means do I pretend to say that the degree of liberty I am claiming for myself and others would never be used; as little, too, am I inclined to assert that a line can be drawn indicating where propriety terminates and error begins. Yet it is surely not more difficult to create the productions of architecture by the test afforded by the principles of the art and the conditions they impose, than the productions of any other art where feeling and imagination are at all concerned. Wherefore, then, should we conceive that the architect alone ought to be always leading-strings, as if incapable of taking a single step without stumbling?

PH.—I have no very clear idea what those principles are which are to guide us when we once quit the track of established authorities; or, supposing them capable of being completely laid down, what is to prevent anyone from interpreting them so as to suit his own purpose.

—But the same objection may be urged as regards the other of the fine arts. I know of no immutable, unchangeable law adapted to every minute and particular case, and we are left to decide for ourselves as the individual artist may require, according to our judgment and that of innate good sense—in other words, of taste—which we happen to be gifted. According to your theory of arguing, no artist, be his talent what it may, can be at liberty to follow its suggestions, because he would afford a precedent that will be abused by those who possess equal confidence in themselves with far less ability.

PH.—You are perfectly right there; and were it in my power, I would enact a law to restrain all further innovation in architecture, so as to preserve it in its present state.

—A very notable scheme, Onophrionus. If, indeed, the world could be regulated by weight and measure, what might be accomplished might be feasible; yet even then, I apprehend, it would be found to consult the interests of mediocrity rather than of talent, since it would effectually prevent the artist from distinguishing himself, and keep it down to the level of the former. But, to come to the point at once, pray tell me, there in this new capital of mine that excites your imagination so violently? All that I have as yet heard you say against it is that it is an innovation, which I do not mean to dispute, it being upon that very point that I arrogate to myself any merit for it. Unless, however, you can point out in what respect it is inconsistent and unsuitable for the purpose for which it is intended, so far from putting me out of conceit with myself, it only convinces me that I have reason to be satisfied with the success of my attempt.

PH.—Pshaw! it is quite idle to attempt to reason with you; you are absolutely incorrigible, Callimachus. The thing there you have invented all that you fondly fancy yourself is, of what service would it be? We already have all that we require; as for new inventions in architecture at this time of day, they are mere chimeras. I do not want them, I tell you—we do not want them; we suffer such conceited gentlemen as yourself to pour their fancies upon us with impunity.

## CALCUTTA VICTORIA MEMORIAL.

A CORRESPONDENT in Calcutta of the *Manchester Guardian*, writing on the 5th inst., says that for some time there have been rumours that the foundations of the Victoria Memorial Hall, the huge and costly building by which Lord Curzon resolved to honour the memory of Queen Victoria, had cracked badly. A committee of engineers appointed to examine the foundations have now presented a report which shows that the rumours were quite accurate. The great difficulty for which sufficient allowance was not made was the treacherous nature of the soil in Calcutta and in the Gangetic delta generally. Every heavy structure in Calcutta has sunk, in some cases to the extent of several inches. And this is not surprising, for the only available ground is a stratum of soil which, in the words of the committee of engineers, "rests, or perhaps we may almost say floats, on the blue silt in which some peat and a water-bearing silver sand stratum are sandwiched." As the 4-feet concrete bed laid for the Memorial Hall has sunk unequally it has cracked. In the circumstances the committee of engineers can recommend proceeding with the undertaking only on the condition that the concrete and footings are separated into suitable sections, that the weight of all new superstructures is materially reduced and that structural stability is secured solely by a steel framework.

These recommendations, which completely alter the character of the proposed building, have caused a good deal of ridicule. *Capital* describes the suggested structure as a "mammoth steel birdcage," and urges that the scheme should be abandoned. The project has, it is notorious, never been popular. Money was raised for it by means of which the less said the better. The Government of India and the local Governments have facilities for bringing pressure to bear on a wealthy rajah, and these, it is said and believed, were freely employed. Moreover, it could not be expected that a magnificent palace in Calcutta would afford much satisfaction to people in Madras, Bombay or Allahabad. Mr. Morley would do much to revive India's confidence in his rule if he used his influence with the trustees to secure the substitution of a number of provincial schemes of a utilitarian character for a purely ornamental enterprise in Calcutta.

## EXPLORATIONS IN GREECE.

IN an article in the *Boston Transcript*, Mr. Arthur Stoddard Cooley, Ph.D., gives a *résumé* of the operations of the various archæological explorations in Greece.

The question so often asked by visitors to the excavations among the ruins of Greece and Italy, how the ancient sites ever came to be buried so deeply, has received one striking answer during the past year at our own excavations at Corinth, as well as at Olympia. As is true in other parts of Europe, the past winter has been unusually severe in Greece, causing great suffering and even loss of life and damage to the land, especially from floods and rain. Even in the early autumn there were very heavy and long-continued rains, and at Corinth our excavation was flooded and much soil washed in from the surrounding fields, so that when the water subsided a deep stratum of mud and debris was left, in some places burying the marble pavements and ancient foundations to a depth of several feet. The famous underground fountain house in the market-place was filled up entirely.

The Greek Department of Education, under whose charge are the ancient remains, cleared away much of the debris, and most of what they may have left will probably be removed during our own excavation campaign, under Director Hill, which should now be in progress. The Greek Government also made some excavations in the course of which among other finds was a fine head of an ephebos. They set up some of the prostrate columns of the ancient Temple of Apollo on the hill, discovered by us in 1899, replaced and strengthened the broken architrave block between two of the standing columns on the south side of the temple, and, removing part of the unfinished Kapodistria school-house, which covered the east end of its foundations, they devoted the rest of the building to a museum, to replace the small and inadequate one just west of Plane Tree Square.

A similar occurrence took place at Olympia in January. The little river Kladeos, swollen by rains, overflowed its banks and buried again, somewhat as it did centuries ago, part of the ruins nearly excavated by the Germans in the seventies. But this time the stream excavated a little, and

in the ancient gymnasium brought to light helmets and other objects. Fortunately no damage was done to the excavated portion of the gymnasium. The red wooden bridge across the river was carried away. According to the plans of the State engineer of Elis, approved by the Minister of Education, the bridge will be rebuilt about 500 feet further up the stream, and a new road will be constructed, starting from the railroad company's hotel and passing some 160 feet north of the Altis. This new road will fill a long-felt want, connecting the district of Gortynia with Pyrgos, and will obviate the passing of travellers through the excavations themselves by transferring the route to the other side of Kronion Hill. Measures will also be taken to keep the Kladeos in its bed and prevent further inundations of the ruins.

Dr. Kabbadias, ephor-general of antiquities, and architect Balanos, who has been in charge of the restoration of the Erechtheum, also recently visited Delphi to take measures for necessary repairs to the museum there and for the care of the outside antiquities, which have suffered considerable damage from the winter rains.

Among the archaeological activities of the Greek Government projected for the coming year is the erection of museums at Larissa, Volo, Tyrnavo and Halmiros in Thessaly, and at Tegea. The sites will be provided by the towns, and Larissa has already given a large plat and appropriated money for the removal of the barracks occupying it. Land at Eleusis and the Boeotian Orchomenos has been expropriated for excavation. The Archaeological Society will devote their surplus of some 170,000 drachmas from last year to the beautifying of the different ancient monuments of Athens. During the past year the Society carried on excavations in the sanctuary of Amphiaraios, near Oropos, at Sounion, in Euboea, Thessaly, Lokris and Naxos, and at Thermos in Ætolia, Lykosoura in Arcadia, Epidauros and Corinth. Besides the work referred to above, at the last place the remains of the Fountain of Peirene were strengthened. The re-erection of the Temple of Apollo, near Phigaleia, with the old material which has been to so large an extent preserved has continued, and the Society has undertaken the preservation of the Byzantine monuments at Mistra, near Sparta, where the old church of St. John has already been repaired. Museums have been built or enlarged at Lykosoura, Sparta and Corfu.

The French school at Athens is devoting its attention, as is well known, to Delos. At the first public meeting of the year at the school, attended by the king, the crown prince and other royalty, and the archaeologists of the various schools, reports of the work there were given by the director, M. Holleaux, and M. Leroux, one of the fellows of the school. Among the more interesting discoveries at Delos are the stoa of the Macedonian King Antigonos II., the double stoa named after Philip, a curious circular monument raised in honour of some prince, and especially a truly magnificent house with a peristyle whose columns still stand upright, a paved vestibule and statues of the owner and his wife. This house seems to belong to the second century, B.C. Fragments of a fresco discovered depict the myth of Ariadne, and among sculptural finds is a head of Bacchus of the Hellenistic period.

M. Leroux spoke especially of the marble lions found at Delos, works of the Naxian school, and adduced evidence that one of the four lions adorning the entrance of the arsenal at Venice had been carried away from Delos. The provenance of the other three was known, they having been brought from Peiraieus.

At one of the open meetings of the German Archaeological Institute at Athens after a commemorative address by Professor Heberdey, director of the Austrian Institute, on the recently deceased archaeologist Benndorf, Dr. Doerpfeld spoke of his work at Leukas. He reminded his hearers that his excavations were not for the purpose of proving Leukas to be the Homeric Ithaca, for this he feels depends on geographical and historical arguments, which both in print and in speech he has often minutely and to many convincingly set forth. Among the most recent converts to his theory is the eminent geologist Philipson, convinced by geographical reasons on the suppositions that Homer described facts and places as they were and not creations of fancy, and that the change of the name of Ithaca to Leukas and the transfer of the name to the island so-called to-day are the result of an emigration. These suppositions Doerpfeld considers as unquestionable, for Homer's accuracy has been proved by the excavations at Troy and Mycenæ and in Crete, and we know from history that the Dorian migration brought about transfers of peoples

and changes of names of places. Doerpfeld's excavations have been carried on in Leukas in the plain of Nydri he locates the city of Odysseus, and at other especially at the so-called Swine's Cave. The finds to prehistoric times and some large walls, which he as most probably remains of the city and palace of Odysseus.

An important work in this connection has just been published—"Maps of Leukas, Contributions to the Ithaca Question"—by a German, Walther von Mevius, to Greece for the purpose by the German Emperor. The first map, on a scale of 1 to 100,000, relates to Leukas and the surrounding regions. Four other maps, on a scale of 1 to 25,000, relate to the channel between Leukas and the mainland and the Homeric localities of Ithaca, according to the clear description of the poet in the Odyssey. The sixth map gives collectively all the localities mentioned in the Odyssey. From the geological and geographical standpoint the question is completely settled by these maps in agreement with what not only Doerpfeld has previously maintained, but other geographers have previously recognised as correct, and the question must now be considered from a philological or archaeological point of view.

Doerpfeld's excavations at Leukas are confined to the summer. In March he began further work at Tiryns, where many ancient works have been unearthed already. He expects to find a still older megaron there, which he revealed twenty-two years ago by Schliemann and his school. He is continuing his investigations also at Olympia, where finds have just been reported on the north-east side of the Pelopion, consisting of clay and bronze figurines, a geometric period, and a small bronze mule and figures of other animals.

The British School at Athens, under the direction of Sir John Dawkins, assisted by Messrs. Dickens, Wace and others, is now prosecuting its excavations at Sparta with great success, and numerous small finds on the site of the temple of Artemis Orthia by the Eurotas, discovered last year in other spots. Word has just been received of the discovery of the famous Temple of Athena Chalkioikos (the Bronze House), of great archaeological and also historical interest. Here the general Pausanias took refuge from the Spartans, was walled in and left to starve to death. Among the finds are three inscribed stone slabs, with the image of a sickle, one of which mentions the name of a victor in three contests; gold dust, a double axe of gold, the symbol of the Cretan king, a Corinthian vase, a headless archaic statuette, and very small cases of different forms associated with the end of the sixth century B.C., and eleven gold coins of the same size and weight of a 20-franc piece. The direction of the south side of the late enclosing wall of Sparta has been determined, and the discovery of the location of Pityeia, the largest of the villages composing the ancient city, is hoped for.

Meanwhile the Greeks are making notable finds in Thessaly. The Ephor Arvanitopoulos discovered a mound near the railroad station of Velestino a quadrilateral building composed wholly of beautiful white marble of the best workmanship. Since this is but a few miles distant from the artificial funeral mound, the ephor thinks we have here a magnificent tomb with portico, peristyle, chamber and propylæa, like those discovered a half century ago among the royal tombs of Pydna and Pella in Macedonia, which belong to the fourth century B.C. Judging from the architecture and by fragments of vases found in the excavation, the ephor dates this building between 400 and 450 before Christ. "It will be an event of great significance if under this funeral mound the spade of the workmen shall discover the graves of the kings of Thessaly, and particularly of Jason, the great ruler of Thessaly, pitifully assassinated, who had conceived the daring and enterprising plan carried out later by the great Macedonian conqueror."

The proposed erection of a museum at Volo, the capital of Thessaly, has been referred to above. A rich collection of inscriptions, coins and other objects found in excavations in Northern Greece is now in temporary quarters, and there are promises of many gifts from private citizens as the museum is ready.

Excavations have been begun on the site of the ancient market-place of Athens, just east of and below the

ere stands the "Theseion." A number of the houses e have been expropriated and will be removed. Near Dipylon gate the old church of the Holy Trinity (Hagia as) is to be removed and rebuilt elsewhere and further avations will be made here at the beginning of the old red Way to Eleusis.

The discovery of the Palace of Kadmos at Thebes in ivations by the Greek Archæological Society is reed.

### COTTAGE COMPETITION.

HE judges of the competition for model cottages at High Wincobank, near Sheffield, consisted of Mr. M. Gibbs, F.R.I.B.A. (chairman), Mr. Brook Kitchin, I.B.A. (architect to the Local Government Board), Mr. Holmes, A.M.I.C.E. (Sheffield), Mr. C. F. Wike, C.E., Mr. A. J. Forsdike, Mr. H. Bedford Tylor (architect to the Bournville Village Trust), Alderman ton (Leeds), Mrs. Chappell and Mrs. Sinclair.

There were forty-two cottages, but in six cases the bidders did not comply with the condition which required n to keep within a certain limit as to cost. In class A cottages were not to cost more than 175*l.*, in class B *l.*, and in class C 225*l.* Nine examples of class A, nty-one of class B and six of class C were presented. judges reported as follows:—

In our examination of the cottages we have compared n with each of the same class as to the extent of accomation, the convenience of the plan in general, and of a room in particular; as to number and position of s, windows and fireplaces, and the provision of suitplaces for the furniture, the nature and quality of res and fittings. We have also considered the comative arrangements for securing healthy cottages, such e selection of the best aspect available on each parlar site, ventilation, sanitary arrangements and fittings, the materials and construction of the building so far hey affect the health.

We have further considered the materials and construcso far as they affect the first cost, the durability and cost of maintenance and repair. And, finally, we have sidered the appearance externally and internally, and finish of the workmanship.

Those of us who have had the opportunities of seeing er exhibitions are of opinion that the cottages at High ncobank are of a high standard as to convenience and struction, and particularly charming internally, and are markable productions for the limited cost; especially as is inclusive of everything ready for occupation except l-papery or decoration; and that the statements as to are so reliable owing to the provision in the conditions t the competitor may be called upon to build twelve er cottages on the estate at the same prices.

We desire to express special approval of the elevation exhibits Nos. 35, 36 and 37 (designed by Messrs. W. A. rvey, A. McKewan, Birmingham, and H. Webster, ffield).

There are, however, defects in some of the cottages to ch attention should be drawn, viz. outer doors into ng rooms without intervening porch or passage, too y doors into living rooms, in some cases on opposite s; fireplaces awkwardly placed in corners of living ns; windows with heads not near the ceiling, not openat the top, and in some cases impossible to clean from inside; sanitary arrangements not sufficiently screened a view; bedrooms in roofs exposed to excess of heat or . But these defects are the exceptions, and serve as rasts to the others, and to show the general high quali-of the whole.

For the four competitors (nine cottages) for Class A we mment that only the gold and bronze medals be rded.

For the nine competitors (twenty-one cottages) in Class B ecommend that additional bronze medals be awarded ose placed third in merit and bracketed equal.

For the three competitors (six cottages) in Class C we mment that only the gold medal be awarded.

n making the following awards we are in complete imity. We place the cottages in order of merit as ws:—

Class A, cottages costing 175*l.*—Gold medal, Mr. H. L. rson, A.R.I.B.A., Sheffield; builders, Messrs. Roper & s. Bronze medal, Messrs. C. J. Innocent & Son, ffield.

Class B, cottages costing not more than 200*l.*—Gold

medal, Mr. F. W. Chapman, Sheffield; builders, Messrs. Dawson & Jones. Silver medal, Messrs. Pepler & Allen, Croydon; builder, Mr. Reeves Charlesworth, Sheffield. Bronze medals, Mr. Peaterson, Mr. F. W. Chapman and J. Smith, Leeds.

Class C, price not exceeding 225*l.*—Gold medal, Messrs. Benton & Roberts, Sheffield; builder, Mr. W. C. Mander.

### FRANCESCO MILIZIA.

THE briefest of all autobiographies is that by Francesco Milizia, the author of the lives known as "*Memorie degli Architetti*." The following is a translation of it:—

"Everybody ought to write the history of his own life in order to incite himself continually to mend it, and in order to furnish to posterity something of the present time which may be depended on. On this account, I who have written so many lives now write a sketch of my own. I was born at Oria, a little town in the Terra di Otranto, in the kingdom of Naples, in 1725. I was the only son of the richest and noblest family of the hamlet. At nine years old I was taken to Padua, where an uncle of mine, who had been driven from home for some youthful errors, exercised the profession of medicine. There I studied the belles lettres to very little purpose, and after seven years ran away from Padua, on account of some reproofs received from my uncle, and wandered to Bobbio, near Piacenza, whence I wrote to my parents; and after going to Pavia and Milan, I came to Rome, where my father met me. He conducted me to Naples, and left me to continue my studies at that capital. I studied a little of logic and metaphysics under the celebrated Abate Genovese, and natural philosophy and geometry under Padre Orlandi, a Celestine monk. But I ran away also from Naples, prompted by a desire to see the world, and especially France, but was obliged to turn back again from Leghorn for want of money. I then returned home to Oria, where, after a long continuance of an idle and heedless life, I retired into a country house to study the sciences. At last, at the age of twenty-five, I married a lady of Gallipoli, of a good family and an agreeable disposition; and there I fixed myself, with some application to books, but more to pleasure.

"Having obtained a more comfortable provision from my father, I came with my wife to Rome, and after remaining there a year and a half, returned to Gallipoli for another year, and then fixed myself at Rome. Here I have continued to study, and took a fancy to architecture without being able to draw. Enamoured of this art, which I think the most beautiful and most useful of all, I wrote the '*Lives of the most Celebrated Architects*,' which was well received by the public, though the criticisms were severe and the style unpolished.

"After this I translated the article '*Bleeding*' from the *Encyclopædia*, and gave a trimming to the physicians and to medicine. Afterwards I compiled the '*Elements of Pure Mathematics*, according to the Abbé de la Caille,' for my own improvement, and it was printed at Rome at the instance of some of my friends. I then wrote other works, and shall continue writing as long as I live. A treatise on the stage was much controverted at Rome. When I conceived that I had made some progress in my architectural studies, I wrote with a degree of bravura the '*Elements of Civil Architecture*,' which has been reprinted many times. My '*Art of Seeing in the Fine Arts*' is a little book which made some noise in the world, and particularly displeased the stupid adorers of Buonarroti. In compliance afterwards with the wishes of a distinguished friend (Cav. Zulian, ambassador of the republic of Venice at Rome), I undertook to write a work to point out the beauties and deformities of ancient and modern Rome, and I published the first part with the title of '*Roma delle belle Arti del Disegno*;' but the persecution of ignorant professors rendered it necessary to suspend the second and third. After this work I attached myself to natural history, and wrote a good deal on plants and animals, without printing anything except the translation of Bowles's '*Introduction to the Natural History and Physical Geography of Spain*,' which was published at Parma. After this, Bailly's '*History of Ancient and Modern Astronomy*' came into my hands, and I made an abridgment of it in one volume in octavo. The '*Encyclopædia Methodica*' furnished me with the means of making a '*Pocket Dictionary of the Fine Arts*,' published in two volumes. The article '*Engraving*' in this dictionary was also printed separately, with some additions. In com-

pliance with the wish of my illustrious friend the Cav. D. Nicola de Azara, I exerted myself considerably in the compilation of the works of Mengs. I have now completed a 'Dictionary of Domestic Medicine,' on the plan of that of W. Buchan, a Scotch physician, which, if printed, will make two volumes in octavo, and will be intelligible to everybody. Another little work on political economy is now in the press, a subject to which I have attached myself in spite of the unsuitable circumstances of the present times." Milizia died in March 1798, of an inflammation in the lungs.

The "Memorie degli Architetti" is preceded by a general view of the principles of the art. He contends that architecture is an imitative art, and he makes its claim to be considered as one of the fine arts to consist in this imitation. In this he is evidently wrong, as the claim of this or any other to a place among the fine arts depends on its power of exciting mental emotion. He then proceeds to give what he considers as fixed and unalterable rules, which he considers to be generally applicable.

### CALCUTTA AND ITS ARCHITECT.

AS if it had not sufficiently impressed its character as an almost valueless talking machine on the public mind, the Calcutta Corporation has signalised its incompetence, says *Indian Engineering*, by abolishing the post of city architect, the duties of whose office are to be entrusted to four district engineers. It is not disparagement of these possibly competent officials to say that, in these days of "specialising," as Mr. Silk has pointed out in the municipality, not one of them can be expected to know anything about architecture. Moreover, as somebody else urged, to no purpose, in the debate—nothing said to any purpose seems as a rule to have much effect in these oratorical field days—both continuity and uniformity are sacrificed when the expert duties of one person are entrusted to four different and virtually inexpert hands. And all this on the eve of an improvement scheme with its special demands on expert architectural direction. It is curious how readily the whole body of Indian Commissioners can be rallied round any cry of economy when a European official has to be thrown overboard, and how readily the same body recognise efficiency at the expense of economy when the pay of some Indian official has to be raised. It is less easy to understand the chairman's action in some matters of this description. That Mr. Allen intends to do his best for his onerous charge has nowhere been publicly questioned. Whether the onerous nature of that charge, with its multiplicity of duties and complexity of claims on time and attention, admit of sufficient care and thought being exercised in each of the numerous matters that come up for treatment at his hands, before being passed on to the Corporation for final adjustment, is a question which, if it has not yet been publicly raised, will probably not be much longer delayed in the raising. One of the certainties of the immediate future will be the appointment of an architect to put the improvement scheme through one section of its difficulties, and when that is the case the chairman will have to face the wholly unjust charge—not anticipated from the want of a little forethought—that he has helped in getting rid of one man in order to make room for another.

### THE EDINBURGH EXHIBITION, 1908.

THE house and grounds of Saughton in Edinburgh, where the Scottish National Exhibition is to be held next year, are now in the possession of the Corporation of Edinburgh. The house is an old place and quaint in many respects, but its history is possessed of little general interest. Of old, says the *Glasgow Herald*, the estate of Saughton was part of the possessions of the abbey of Holyrood, and it appears that in 1537 the property was transferred to Richard Watson. The oldest title now extant among the family papers is a charter of a feu farm dated September 16, 1553, by which Robert, commendator of the monastery of Holyrood, with consent of the convent and of the commendator and convent of Melrose, granted six oxengates of the town and lands of Saughton, lying in the regality of Broughton and sheriffdom of Edinburgh, to Janet Stenhope, relict of Richard Watson, in liferent, and to James Watson, her son, in fee. From time to time further portions of land adjoining were acquired by the Watsons of Saughton. In 1657

David Watson, of Saughton, obtained a conveyance of the superiority of Saughton Mills from James Winrahame Wiston. The estate passed from father to son in the direct line until 1837, when William Ramsay Watson, the last male of the family, succeeded his brother Charles. Four years later, on his death, the succession opened to his sister Helen. In 1844 this lady married Sholto John, Lord Aberdour, who in 1858 became twentieth Earl of Morton. The house built on the L plan of Scottish architecture. At the joint of the angle a porch has been added, and on one side a small one-storey addition. In front of the house is an ancient draw-well nearly 50 feet deep. It is said that the house was formerly surrounded by a walled courtyard which included this well, and the state of the ground well turned up by gardening operations confirmed this tradition. The rooms on the ground floor are chiefly kitchen apartments and have vaulted stone roofs. One of these is especially interesting. When a thick coat of whitewash had been cleaned off some years ago the roof was found to be covered over with quaint old paintings in oil, most of them in wonderfully good preservation. On a blue ground sprinkled with stars is painted a conventional sun, filling the centre of the roof of the old hall, with the twelve signs of the Zodiac encircling him. Along the spring of the arch on one side is a line of ships in full sail. The burial-place of the Watsons of Saughton is in Corstorphine Church beneath the floor at the entrance to the south transept. Nisbet, in his "Heraldry," writing at the end of the seventeenth century, after describing the arms of Watson of Saughton, speaks of the motto "Inspirata Floruit"—"pointing to the condition of the family who, being possessed of these lands upwards of one hundred years ago, they now enjoy the same again." This would seem to imply that when Richard Watson acquired the estate in 1537 he was recovering an ancient possession of his house.

The ceremony of cutting the first sod in connection with the Scottish National Exhibition was performed on Wednesday by Mrs. Gibson, wife of the Lord Provost of Edinburgh. Sir Robert Cranston, K.C.V.O., chairman of the executive council, presided, and there was present a large and representative company.

### ARCHITECTS AND CONTRACTS.

IN the official report of the last Convention of the American Institute, which has just appeared, we find the following report of the committee "On the Relations of Architects to the Contracting System," with the remarks which it suggested:—

The time allowed this committee has been so short that the subject is so large that the committee can scarcely more than report progress. Nevertheless, the question is of such importance that it appears proper to call your attention to the following facts:—

Some fifteen or twenty years ago it was the usual custom to get proposals from the heads of various trades and to award a number of separate contracts for the work of one building—one each for the mason, plasterer, carpenter, steam-fitter, and so forth. As building construction became more complex there arose a desire to place the work of these various trades under one general contract, and this idea had some advantages to commend it. It was found in practice that at times, with a number of minor contracts at work in one building, there were moments of friction, interference and delay. Sometimes the minor contracts did not join each other exactly, and then an extra bill had to be incurred to complete the structure. Therefore it seemed desirable to put all the work under one general contractor, who would be solely responsible for the whole building and for items which might have been overlooked in minor subdivision. This system appeared to have many advantages, among others, in avoiding the difficulty of telling your client that you were not omniscient and omnipresent. It was not pleasant to tell him that you had forgotten to specify something that would make a plumbing connect with the steam-fitting. You went to him for an extra, but you hesitated to do it. So perhaps you were willing to take refuge under the general contract system. But in this respect the alleged advantage was more apparent than real, for, as you all know, the general contractor was just as keen to take advantage of any deficiency in your specification as were the minor contractors, and the general clauses intended to bridge the gaps proved to be without binding force.

Then there seemed to be another advantage when the general contractor went to the structural steel concerns

drawings of trusses or beams that you had not the time the opportunity or the inclination to prepare yourself. At any rate, we were willing to accept what seemed an easy way, by attempting to load the whole responsibility on one firm. But by this the general contractor has become the arbiter of the building trades. You may guard our procedure by providing that no sub-contractor shall be accepted without your approval, nevertheless the pressure to accept the cheapest sub-contractor, exerted by the general contractor prevails, and this is particularly true of public work. This setting up of the general contractor has resulted in the great building corporations of the present time. They have been able to force the sub-contractor to a lower price, consequently they have introduced a lower grade of work and have succeeded in keeping the architect's term's length from the man who does the work. So much for this case that public bodies, Governmental departments, States, cities, counties, in their contracts state that they will not recognise the sub-contractor. Thus the general contractor gains power to control the sub-contractors to his own ends.

The great promoting and building proposition grows up by introducing the method of competition that relies entirely upon the price and seldom upon the quality. Strive as you will, you cannot bring about a better state of affairs so long as you have the general contractor whose interests are, as a rule, monetary and seldom or never æsthetic or even constructional; for the general contractor who looks upon these things as we look upon them is very rare, and competition at a price soon drives him from the field.

The great building company is the great depositor in the local banks, its members become the directors of banks and of trust companies and insurance corporations and other public bodies. And whereas the former sub-contractors were of considerable importance they are now crowded out, their output is modified, the standard of their work is lowered by price competition, pride of workmanship must give place to a commercial fight for existence and they are reduced to a condition of despair. They must employ cheaper labour, so they fight with the unions upon issues which they could otherwise easily adjust. Sympathetic strikes occur all along the line where strikes might be confined to one particular trade, and the whole matter grows more complex and difficult as we proceed. When a building corporation has grown great it assumes to control the situation. In New York, and possibly in all our large cities, it may be truthfully said that not one in twenty of the important buildings (that is, such as cost half a million dollars and upward) are handled by private enterprise or are under the control of the architect as they formerly were. The building company employs the architect and assumes to control his design, and very largely does. And the man who opposes that system must find his opportunity in some other direction—certainly not in building important commercial buildings. The building company will be supported by the finance committee of the life insurance company that loans the loan and handles the stock and bonds. Ultimately the building company falls into the hands of a financial man or oftener of a financial committee, whose members may perhaps be a real estate man, a director of a bank or a broker, none of whom has any practical knowledge of building. These men care nothing so long as they can make a satisfactory report on the money invested. Property is affected by this as well as loans and the statement of values upon which loans are based. So that when you look over the situation you find that we ourselves, by our method of general contracting, have built up within the last twenty years these companies. It is said that we could cite one building company that entered New York with a capital of 600,000 dols. and inside of eighteen months had recapitalised for five million dollars, and less than a year later had recapitalised for twenty million dollars and inside of five years reorganised with a capital of sixty million, and with an organisation that extended through many of the important financial interests of the city and affiliated with one of the largest banks in the country. This corporation claimed to practically command the output of a great steel corporation, and informed its clients that it could get good steel before anybody else, as it was the largest purchaser of structural steel in the country and could therefore get preferences in milling and delivery. Such corporations say:—"Come to us, let us design your work; we will employ this architect in our own way and guarantee the results, and we are such large buyers of steel that we get rebates and opportunities of rapid shipment and can do better than the architect can do." This seems to your committee a most extraordinary

situation and one that merits your serious attention. We see no reason for supporting a system which is uneconomic, which is disastrous to our business interests, destructive to our professional relations with our proper clients, and absolutely damning to our art.

In our present judgment there may be times when we should advocate the employment of a general contractor, but as a rule it should be the sentiment of the architects of the country to deal with the men that do the work, and that as far as possible we should induce our clients to revert to the old system of letting special contracts for each important branch of their work, and particularly advise them that contingencies may arise which we cannot foresee, but ask them to charge the contingent fund against the 5 to 15 per cent. profit that will be charged by a general contractor or broker, and let them pay a portion of the balance to the architect for his additional services.

We are confronting a situation that means that no architect who desires to practise his profession honourably will find any opportunity for so doing. Emerson said, "Courageous confidence in the intelligence of the community is the sure sign of leadership and success." When this body is ready to take its proper place and courageously discuss these questions of economics relating to the art and business of building in this country, we will be respected accordingly.

Mr. Geo. B. Post: There is one element of the matter which Mr. Gilbert's admirable presentation did not touch. In public work it is a frequent occurrence that a general contractor is appointed who is the lowest bidder, but who is not really a building contractor nor a mechanic in any one of the trades, but a mere building broker who assembles a lot of sub-bids or guesses at the cost and takes the contract, beats down the price of sub-contractors, and attempts to carry on the work without any of the skill and power of direction which makes the fully competent general contractor valuable in works which are to be erected rapidly. Where this evil occurs the architect is forced to perform in his office a large part of the duty for which the general contractor receives pay. The general contractor receives from 5 to 15 per cent. of the cost of the building with practically no expense, with profit guaranteed by sub-contracts and protected by bonds given by sub-contractors and operating on their capital.

Mr. Ralph Adams Cram: We are confronted by a situation that means the annihilation of the honourable practice of architecture in the United States. What is the good of talking about methods of reforming architectural education if no man who desires to practise his profession honourably is to find any opportunity for so doing? I move that the report of the committee and Mr. Post's remarks be printed separately and a copy sent to each member of the Institute.

Many members expressed approval of the report. In order that their ideas might receive the formal sanction of the Institute a committee was appointed to draft resolutions, which being offered at a subsequent session by Mr. Charles I. Berg, were unanimously adopted as follows:—

Whereas the existing condition outlined by the report of the committee "On the Relation of Architects to the Contracting System" is one which menaces the entire architectural profession and, if carried to its logical conclusion, would make impossible "the honourable practice of architecture."

Resolved, That this report be adopted as expressing, not alone the ideas of the members of the committee, but as well the convictions of the American Institute of Architects in convention assembled; and that the Board of Directors be, and hereby is, instructed to receive, edit and print the report of the committee, together with the subsequent expressions of opinion on the part of members of the committee and of the Institute, giving these at the earliest possible moment such publicity as, in its opinion, is best adapted to protect the interests of the architect and of his client.

**The Annual General Meeting of the Scottish Art Teachers' Association** was held in Edinburgh on Saturday. In view of the meeting of the International Congress of Drawing, which takes place next year in London, it was arranged to hold a preliminary exhibition of drawings from which a selection could be made to form a typical exhibit of the work of Scottish children. The following office-bearers for the ensuing year were elected:—President, Mr. David Symons, Aberdeen; vice-president, Mr. Robert Walker, Hamilton; secretary and treasurer, Mr. D. Scott Murray, Laurel Bank, Perth.

#### Income-tax Inquisition.

SIR,—The Inland Revenue authorities seem to have decided upon what must be regarded as a revolutionary and most objectionable course of action in connection with the allowance to be made to machinery users under the new Finance Act.

A few days ago we were informed by a surveyor of taxes that the Board of Inland Revenue had given instructions to their surveyors to oppose any allowance in respect of depreciation of machinery and plant unless a balance sheet is produced. Now there are many persons who have the strongest possible objection to show their balance sheets, as, although it is inevitable that they must state their profits, they are very unwilling to let either the surveyor or the commissioners of taxes have before them particulars of their liabilities and assets. It must be remembered that (except in the case of those persons who make their returns to the Commissioners for Special Purposes) all accounts go before the local Commissioners of Taxes, who are frequently creditors of appellants, and in many cases their rivals in trade. Moreover, it is a well-known fact that, notwithstanding the boasted secrecy observed in regard to income-tax returns, all papers in connection with assessments made by local commissioners are open to the inspection of the surveyor's clerks, many of whom are only youths, and none of whom is a Government servant. This is obviously highly objectionable, more particularly in the smaller provincial towns. Again, there are many traders in a comparatively small way of business who have never had balance sheets prepared, and to do so would often cost more than the amount they would save in income tax by the allowance for depreciation.

Surely the income tax is already sufficiently unpopular without adopting means to make it even more inquisitorial, and we think that, except in rare cases (*e.g.* where there is good ground for doubting the truth of the profit and loss accounts), it should not be necessary to require the production of balance sheets. Certainly the balance sheet is not essential evidence for showing the profit made or arriving at a proper assessment, and in no case where the profit and loss accounts have been certified by a reputable firm of practising accountants should the taxpayer be subjected to such inquisitorial treatment.

The much-vaunted relief to earned incomes will, we are confident, cause very grave dissatisfaction, as before the benefit of the 9d. rate can be obtained information of a very confidential character has to be furnished, particularly in reference to borrowed money employed in the carrying-on of businesses and annuities paid out of the profits, thereby making one set of taxpayers disclose particulars relating to the incomes of others who perhaps do not claim abatement from income tax in any form.—Yours, &c.,

The Income-tax Adjustment Agency, Ltd.,

E. MONTAGUE, Secretary.

9, 10 and 11 Poultry, Cheapside, E.C. :

September 25, 1907.

#### GENERAL.

The Corporation of Hertford have decided to erect new municipal offices in a central position in the town, at a cost not exceeding 3,500*l.* Premiums of 50*l.* and 20*l.* respectively are offered to architects for the two best designs sent in for the buildings.

A Series of Rural Paintings has been executed by Mr. N. H. J. Westlake in St. Augustine's Church, at Tunbridge Wells. The paintings illustrate events in the life of St. Augustine. The subjects form a continuous frieze, 150 feet in length.

The Coroner's Inquiry into the deaths caused by the cinematograph fire at Newmarket closed last week. The jury, after twenty minutes' absence, returned a verdict of "Death from shock, caused by burns occasioned by an accidental outbreak of fire caused by panic." They added the following rider:—"The jury are of opinion that sufficient precautions were not taken by the company for the safety of the public, and that the Urban District Council who let the town hall should in future exact the same provisions as the London County Council require in letting their halls for these entertainments."

Alderman Sir Vezey Strong stated at a meeting of the Court of Common Council on the 19th inst. that since the last Court good progress had been made with the negotiations for the acquisition of Crosby Hall. In fact, matters had advanced so far that the Lord Mayor would summon a meeting of citizens to discuss the situation. The Lord Mayor announced that he had fixed the date of the meeting for the afternoon of October 1 at the Mansion House.

The Twerton School Managers at their last monthly meeting agreed after some discussion "That the managers ask the county education committee for power to employ a local architect or surveyor to prepare plans and specifications when they deem necessary in connection with work to be carried out at Twerton Council schools and to supervise the carrying out of such work." Heretofore it has been usual for the managers to draw up their own specifications and to superintend their carrying out.

Bishop Weldon (Dean of Manchester), before beginning his sermon at Manchester Cathedral on Sunday evening said:—"The installation of the electric light is far advanced. It will, I am told, be completed by the end of next month so that the light will illumine the cathedral on the Sunday that the new Lord Mayor comes to worship here. But it has been a costly work; costlier than was contemplated at first, apparently because of its magnitude. There will be nearly twenty miles of wiring in the cathedral, because it has been thought right in so ancient and sacred an edifice to do the work in the best possible manner, and to avoid any interference or connection with the woodwork. But I believe the congregation will feel that the improvement of the light only but of the atmosphere in the cathedral will greatly tend to comfort, reverence and Divine worship."

Mr. B. W. Adkin, F.S.I., has removed from 14 Queen Street, Cheapside, E.C., to larger offices at 82 Victoria Street, Westminster, S.W., where he will continue to practise as surveyor, land agent and architect.

Applications are invited for the appointment of assistant instructor at the Wellington technical school, New Zealand. Salary, 250*l.*; 40*l.* allowed towards passage. Age not to exceed thirty-five years. For further particulars apply to the High Commissioner for New Zealand, 13 Victoria Street, London, S.W.

The List of special arrangements at the University of London, University College, for the present session includes the following:—On October 3, at 3.30 p.m., Professor Flinders Petrie will begin a course of lectures, illustrated by lantern slides, on "Egypt and Babylonia Compared." A special course of lectures on "School Hygiene" by Professor Kenwood and Dr. Meredith Richards has been instituted and will begin on October 16 at 7.15 p.m. Professor Gardner will lecture on "Characteristics of Greek Sculpture" on October 11. Evening classes will be held in the Department of Architecture. Mr. E. S. Prior will deliver a course of ten lectures on "English Mediaeval Architecture" beginning on October 11; and design classes will be held beginning on October 9 and October 10.

A Series of discoveries has been made at Leighs Priory, Essex, culminating in the finding of the complete ground plan of the monastic buildings which were destroyed by Lord Rich at the time the property came into his possession after the suppression of the monasteries. The present owner, Mr. Hughes-Hughes, who recently purchased the remains of the old Tudor palace built by Lord Rich on the site of the priory, has had the meadow adjoining the ruins excavated, and less than 2 feet below the surface the workmen struck the flint rubble foundation. The carved bases of pillars remain intact, and there are evidences of a portion of Lord Rich's palace having been erected on some of the older foundations.

The Royal Society of Antiquaries of Ireland will hold a quarterly meeting on Tuesday next. On Wednesday, October 2, an excursion (in conjunction with the Kildare Archaeological Society) to the antiquities of Carbury and the neighbourhood has been arranged.

The Will has been proved of Sir Wm. Robertson Copland, LL.D., who practised as a civil engineer and surveyor at 20 Sandyford Place, Glasgow. He was formerly borough engineer for Paisley. The amount of his personal estate is declared at 21,053*l.*

Mr. Banister Fletcher, F.R.I.B.A., will commence a course of public lectures on "Gothic Architecture in Europe," illustrated by lantern slides, at the University of London, Imperial Institute Road, South Kensington, S.W., on Monday, September 30, at 8 p.m. These lectures will form a continuation of those given on "Ancient Architecture" last session.

## THE WEEK.

many rumours have been circulated about Crosby it is excusable if some people are doubtful whether it is feasible to preserve the most important portion of the building. The meeting held at the Mansion House Tuesday has revealed the true state of the case. In the first place, it is manifest from the report of Messrs. RYDON & GUNTON that the directors of the Chartered Bank have been most anxious to preserve as large a portion as possible of the ancient mansion. If money is forthcoming the old hall can escape demolition, and is sufficiently stable to have, as Mr. CARÖE remarked, an unlimited life before it. But it cannot be expected that the directors of the bank and the contractors can remain in an uncertain position for an indefinite time. It is necessary to act not only with decision but with promptitude. The purchase of interests will amount to £110,000, and £10,000 will be needed to uphold the old buildings. A large proportion could be raised on mortgage, for the property would be valuable. Sir RICHARD STRONG urged that the twelve principal companies should each contribute £2,000 each, while the other companies should also assist according to their resources. If the public subscribed £20,000 the financial position would be secured, especially if the directors of the Chartered Bank recognised the improved position which they would obtain by exchange of property in the rear for property with a valuable frontage. The subject has assumed an aspect which men of business recognise, and it only remains for them to exhibit more their accustomed liberality in what might be considered a national service.

A RATHER unusual case was heard on Tuesday before the stipendiary magistrate in Manchester. Messrs. LEAH, builders, were summoned for breach of bye-laws by deviating from a plan which had been approved. It was proposed to erect houses in Fitzroy Street. The street should have been 12 yards wide. Owing to the character of the ground the improvement committee consented to a width of 10 yards. The building line was pegged out by one of the Corporation officials and apparently it was followed. But it was afterwards alleged that the official made a mistake, and a part of the wall which was erected encroached 6 inches upon the street. The Corporation would not accept responsibility, and Messrs. LEAH, as they followed the line of the official surveyor, considered they were not liable. The stipendiary magistrate said that 10 yards wide should have been made, but was unable to impose a penalty for every day the houses remained. Eventually he decided to impose a penalty of £10 and to allow the question of a daily penalty to stand for a month. Messrs. LEAH promised that the back-garden should be at once undertaken. The Corporation contended that they were not obliged by the bye-law to peg out the ground, and it was only for the convenience of the builders the surveyor acted.

WHEN the power to distrain was first granted in the Middle Ages, it was unusual for one man's property to be taken in another man's house. "The taking of a personal chattel out of the possession of the wrongdoer into the custody of the party injured, to procure satisfaction for the wrong committed," accordingly appeared no more than reasonable. But in days of undertenants and lodgers the ancient power should be exercised with discretion, that is, if equity is to prevail. The members of the United Arts Club and their property are now suffering because the feudal principle is not to be recognised as fair, although under difficult circumstances. The club occupies part of the building which once upon a time was known as Almack's.

Another part was used as a restaurant, but the keepers of it failed while owing £2,000 to the superior landlords, who seized under distraint not only the goods in the restaurant, but nearly two hundred pictures which were on view in the club. It was a perfectly legal act as the law now stands. An injunction was applied for, but Mr. Justice NEVILL had no authority to grant it. The club has appealed against this decision, and, if need be, in the interests of the artists primarily and the public generally, it is intended to take the matter up to the House of Lords if possible. But to do this the club, which is a new institution, requires financial support, and all friends of art and justice are invited to help by kindly forwarding their subscriptions for this purpose to the club's bankers, Messrs. BROWN, SHIPLEY & Co., 123 Pall Mall, S.W., for the credit of the United Arts Club Picture Defence Fund. The grievance is no new one, for cases are always occurring where lodgers and others are found in the same predicament as the United Arts Club. But it is doubtful whether a power which has been respected for so many centuries could be set aside by any judges. In the end it would be more economical to endeavour to come to terms with the landlords.

It would appear there is competition between the electricity department of the Edinburgh Corporation and the Gas Commissioners which leads to some curious results, and is causing inconvenience to architects. One architect describes in the *Scotsman* his experience. The Corporation officials made it a condition that on no account should gas for lighting purposes be introduced in some houses which are being erected for working-class tenants. The Gas Commissioners' official asked that gas pipes should be introduced into the houses for the purpose of cooking. The architect afterwards received a letter from the chief engineer, in which he states:—"My inspector reports to me that there is no probable consumption other than the prospective use of a grilling stove. I regret to say, therefore, that unless provision is made for lighting the kitchen by gas I cannot see my way to advise the Commissioners to lay a gas connection to the property at all, seeing that the public stair is to be lighted by electricity." But if the kitchens are lighted with gas the electric light department refuse to light the staircase. Possibly a similar rivalry is exhibited elsewhere. But as Edinburgh houses generally consist of several independent tenements, an unlighted staircase is not only inconvenient, but is, we believe, illegal.

AUGSBURG is too near Munich to rival that city, yet it has an interest of its own which is peculiar. It might be taken as exemplifying the history of burghs in central Europe. The Romans occupied it, it became a free city, and from the extent of its trade it might be called an inland Venice. A great many of the houses which remain are evidence not only of the wealth of the citizens but of their love of art. For, as in Venice, we can still see frescoes on the exteriors which were intended to please all who pass by them. The name of PLANTIN is not more closely connected with Antwerp than that of FUGGER with Augsburg. Originally weavers, there seemed to be no branch of commerce with which they were not connected during several centuries, and some of the institutions they founded remain a benefit to the inhabitants. The paintings in the Fuggerhaus suggest the close connection there was between them and the history of Augsburg. The splendid room known as the bath-room, which the family towards the close of the sixteenth century had decorated by the Italian painters, LAMBERTO and PONSANA, has been reopened. The old frescoes have been cleaned and the cases in the room are filled with a splendid collection of weapons, coins, sculpture, ivory, porcelain and other examples of industrial art. The FUGGERS spared no expense to obtain the best examples that could be produced, and Gothic as well as Renaissance work is well represented.

## MR. WALTER CRANE.\*

THE numerous admirers of Mr. WALTER CRANE, and they are not confined to his countrymen, are aware that some of his most successful designs have taken the form of a procession. He was early impressed with HANS BURGMAIR'S *Triumph of Maximilian*, and there can be no doubt he also studied MANTEGNA'S *Triumph of Julius Caesar*. Their influence is to be seen in his fine *Triumph of Labour*, as well as in other works. The book of reminiscences which he has just published is another effort of the same class. It is not an example of a skilful biography, and it would be far more effective if many pages were omitted and if greater regard were given to the relative importance of details. But, as in one of the artist's processions, there are no vacant places and everything appears on one plane, so in writing about himself Mr. CRANE is indifferent to old-fashioned rules of composition, and in that way has succeeded in filling up five hundred pages about his own life as a hard-working artist to whom Fate was kind in sparing him from becoming the hero or the victim of hazardous adventures.

But the life itself can be considered as a triumph. Mr. CRANE was endowed by nature with great gifts, and he has exercised them for the gratification of the world to the fullest. Many able painters believe it is to their interest to keep a check on their productiveness, and when their pictures are sought after they are not always forthcoming. Mr. CRANE has never been an economical tactician of that kind. However varied might be the opportunities presented to him he never declined them. The consequence is that he has a right to be considered the most versatile of English painters. He has produced a large number of pictures in oils, distemper and water-colour; he has designed for reproductions in different materials; he has revived old processes and he has not only illustrated books but composed them in prose and verse. In addition, Mr. CRANE has been a zealous politician, and he has made various efforts to improve the position of his brother artists. He has also held official positions, and he has been able to travel in many countries.

It is interesting to trace how so successful a career became possible. Mr. CRANE was the son of an artist who could hardly be called prosperous. He was born in 1845. A delight in drawing was early manifested, and when he was thirteen he was apprenticed to W. J. LINTON, the wood-engraver, in order to learn the art and mystery of drawing on wood. His master was probably the best wood-cutter then living. This was strange, for LINTON'S hobby was revolutionary politics. In 1848, any newspaper that would have the courage to print them could have long epistles regularly from him. He wrote so many in the Irish Nationalist journals that the people who had at first imagined he was one of the greatest of artists looked on him as a bore or a Government agent. But his work as an engraver did not suffer, and in business affairs he had an excellent partner in the younger ORRIN SMITH, who managed the office. WALTER CRANE had his share in drawing the various subjects—commercial, anatomical, artistic—for which blocks had to be prepared. His utility was increased by the fact that he was without a specialty.

His apprenticeship having ended, he had to work for the trade. Publishers took advantage of his inexperience, and the circumstance that a representative of evangelicism insisted on deducting 5 per cent. commission on a bill of about 1*l.* must have weakened the young artist's respect for ultra moral people. What first brought him into notice were the illustrations for J. R. WISE'S book on "The New Forest." They were so elaborate they might easily be taken as copies of photographs; but they were drawn from nature, and were enough to suggest that the pre-Raphaelites had

gained a new colleague. As the work of a lad of sixteen they were considered remarkable. About the same time Mr. CRANE painted a small *Lady of Shalott* which was not only hung in the Royal Academy but found a purchaser at five guineas with a commission a companion at the same price. The late EDWARD EVANS, a wood-engraver who was very successful, realised the possibility of printing blocks in colour in a more refined style than was then favoured. He found in Mr. CRANE a qualified coadjutor, and the children's books which were the result were at once successful. Mr. CRANE used his evenings not only for studying HEATHERLEY'S, but in reading books which in those days were supposed to come from the most advanced thinkers. When he was twenty he came under the influence of MADDOX BROWN and BURNE-JONES. A drawing by the latter had to be removed from the Water-Colour Society exhibition because it contained a nude figure. But this increased sympathy for BURNE-JONES among young artists, one of whom was Mr. CRANE, who says:—

Though the artist exhibited publicly no more until years afterwards, those early works had their effect. The curtain had been lifted, and we had had a glimpse of a magic world of romance and pictured poetry, people and ghosts of "ladies dead and lonely knights," a twilight of dark mysterious woodlands, haunted streams, meadows deep green starred with burning flowers, veiled in a soft and mystic light, and stained with low toned crimson and gold.

Mr. CRANE began to be recognised as more than a wood-draughtsman, although perhaps it did not become clear in what field he was to gain distinction. He worked for various publications, including *Fun*; but he was not without ambition, and when he was twenty-three he exhibited a drawing in the Dudley Gallery which was intended "to embody in design and picture something which would symbolise the new philosophy of evolution, which the researches and discoveries of DARWIN and the writings of HERBERT SPENCER were building up. One felt that a new epoch had dawned upon the world, and longed to give it some artistic expression."

Mr. CRANE'S example should be taken to heart by many young artists. Instead of waiting on fate until she sent him commissions worthy of his talent, he recognised the importance of work, however humble, as an exercise, and when in course of time important commissions came to him he was able to execute them satisfactorily. Two landscape studies of his were purchased by LEIGHTON, but although he might aspire to the patronage of the great, he did not neglect to improve the plates for his picture books. He received a number of some Japanese colour prints, and he tells us: "Their treatment in definite black outline and brilliant as well as delicate colours, vivid dramatic decorative feeling, struck me at once, and I endeavoured to apply these methods to the modern fanciful humorous subjects of children's toy-books, and the methods of wood-engraving and machine-printing. CRANE has the true workman's recognition of the value of wherever it is found, and was no doubt always animated with a desire to take advantage of any "wisdom" which came in his way. The consequence is that in spite of the size of the book, there is nowhere to be found in it any effort to make little of another man's work.

For his connection with architecture he appears to have been indebted to the late E. J. TAYLOR, who invited him to paint a frieze of animals and birds for a house in Kensington and a series of panels for "Æsop's Fables" for a house in Worcester. The work was in raised gesso, and suggests the range of CRANE'S studies when he is found capable of employing it. Experience of another kind was offered him by JEFFREY & Co. who commissioned him to design a series of wall-paper. As it was to be for machine-printing, the outlines of the faces had to be formed of brass

\* *An Artist's Reminiscences.* By Walter Crane. With 123 Illustrations by the Author and others from Photographs. (London: Methuen Co.)

which was not favourable to subtlety of expression; in it way began a connection which has continued up to the present time.

When the Grosvenor Gallery was projected Mr. CRANE was invited to become one of the supporters. He was appointed member of the advisory committee of the new Royal School of Art Needlework, and this gave him frequent opportunities to design hangings, screens and panels. It indicates his position when we find him the author of "Alice in Wonderland" negotiating with Mr. CRANE for designs for a new book. In one of his business letters "LEWIS CARROLL" expressed his interest in the evolution of painting, which, according to him, came after sculpture. It suggests that the curious calculations of the charming ALICE were inspired by a notion which was not supposed to agree with accepted beliefs:—

My theory is that among savages there is a much earlier stage than outline drawing, viz. mere reproduction (in ink &c.) of the solid form. I imagine that you would find many and other representations in solid form among nations where no kind of drawing is unknown. The next step I should expect to be alto-relievo (arising from the discovery that you can only see one side of an image at once), and would gradually flatten down. Then the effect (with a light) would be of a flat surface with strong black lines and shadow marking the outline of the form represented. The next step would be to paint lines representing the shadows, and such lines would be broad at first and then narrow on discovering that their breadth was not an essential feature. However, this is all rather theory without actual knowledge.

A commission of a different kind was obtained in connection with the ceiling of a house near Sevenoaks, on which he utilised the assistance of Mr. OSMUND WEEKS. He tells us that "the figures were all modelled in gesso composed of fine Italian plaster of Paris mixed with glue or size, and worked with cotton wool soaked in the gesso on fibrous plaster panels, which were made for me by Messrs. JACKSON, of Rathbone Place; the painting borders and mouldings being cast in plaster. The whole ceiling was coloured by bronze and white oil."

WILLIAM MORRIS having woven with his own hands a complete piece of tapestry, applied to Mr. CRANE for a design of a more elaborate work, with plenty of trees.

The cartoon was 8 feet by 6 feet, and the figure is now at South Kensington. The designs for the mosaic frieze in LEIGHTON'S Arab hall were likewise obtained from Mr. CRANE. He also took up tempera painting, of which examples were seen in the Grosvenor Gallery. In the intervals of larger works Mr. CRANE continued to be as willing as ever to prepare illustrations for books, and, indeed, some of his best designs were produced for that purpose.

In other ways he has served the cause of art. He was one of the early promoters of the National Association for the Advancement of Art—an institution that has since had a longer life than was allotted to it. The efforts which Mr. CRANE read at the meetings were adapted to popularise art. But all the orators were not so definite in their ideas, and in consequence the Society collapsed. He was also one of the founders of the Society of the Arts and Crafts Exhibition, and served the office of master of the Workers' Guild. He accepted the directorship of the Manchester School of Art, but had to resign because he found that it interfered with his work in London. Then he became director of the Art Department of the Reading College, and subsequently Director of Art at South Kensington. All these tests of his ability were passed through successfully, and if Mr. CRANE has not displayed the many-sidedness of the great Renaissance artists, he has sustained trials which would have daunted them, and has proved that it is possible to be an able artist in our time without becoming a specialist, and that services for the

public good can be rendered without diminution of creative power in art.

It is, however, to be regretted that the paintings, which display subtle thought as well as technique, should not be appreciated in this country. Mr. CRANE, with his customary good temper, explains the phenomenon. "It seems curious," he says, "that most of my principal pictures should find homes in Germany, and that hardly anyone besides Mr. WATTS should have shown much interest in them. Possibly, apart from any artistic quality, the symbolic and figurative character of their subjects are more in sympathy with the Teutonic mind, and we like 'all goods marked in plain figures' in England; and though a painter before I was a designer, I had been labelled 'Children's Books' or 'Arts and Crafts,' and it is preposterous for a man to expect to be recognised without his usual label; besides, it disturbs the commercial order of things." That may be true, but it is pitiful, and is not encouraging to those who wish to exercise all their power for the public benefit.

#### CLASSIC ORNAMENT.\*

ALTHOUGH architectural draughtsmanship has advanced since 1825, it is doubtful whether any modern representations of Classic ornament excel the engravings after VULLIAMY's drawings by HENRY MOSES. He was connected with the British Museum, and restricted himself to outlines. He could not, therefore, conceal defects by means of light and shade or "working up," which have enabled many unsatisfactory plates to gain approval. The originals having been obtained by Mr. BATSFORD, they have been used for the reprinting, and, in consequence, every line has the original sharpness which would be impossible if lithographic transfers had been substituted. Apart from their suitability for application in an architect's office, the plates, from their manner of execution, afford pleasure to all lovers of the engraver's art as well as to those who can appreciate refined curvature, symmetry and adaptability of form to occupy spaces of different forms. The ornament, moreover, might have had a suggestiveness which cannot always be recognised by moderns, and which may give rise to speculation. MOSES apparently avoided the use of mechanical aids to produce his lines, and if his circles and curves are not mathematically correct we imagine they must approximate closely to the carver's work. Throughout there is evidently a feeling of pleasure in the work, however laborious, and we may therefore suppose it was not necessary for the engraver to be expeditious in the execution in order to gain a livelihood. At the beginning of the nineteenth century such a publication would be accepted as enabling an architect like VULLIAMY to stand among his foremost contemporaries.

Sixteen of the plates are taken from Greek examples, and the remaining four have characteristics which suggest that in spite of the luxuriance of the detail they are the work of Greek hands. The series may therefore be considered as representing what is best in Classic ornament. That so few plates are adequate for such a subject is remarkable. It is evidence that laws of restriction were accepted in dealing with ornament no less than with the more important constructional features. We cannot suppose that Greek imagination was not able to present as many forms as arose among artists of later times. But sobriety was then considered to be a virtue in art, and, moreover, there may have been associations with some of the forms which gave gratification to those who looked on them however often they were repeated.

\* *Examples of Classic Ornament from Greece and Rome.* Drawn from the originals by Lewis Vulliamy, architect, gold medallist and travelling student of the Royal Academy (1790-1871). A Series of Twenty Plates selected from the original published work, with Introductory and Descriptive Notes by R. Phenè Spiers, F.S.A. (London: B. T. Batsford.)

This repetition is seen in the examples of steles which, from being private memorials, might have been expected to exhibit some novelty. But the six examples selected by VULLIAMY display the anthemion, although the parts are arranged differently to suit the figures to the spaces which they adorned. One is an archaic example which, like some others of the subjects, no longer exists, and it suggests the severity which prevailed at an early time, and which no doubt arose from the shortcomings of the sculptors. When LEWIS VULLIAMY was in Greece development had not become a scientific system. But if he wished to exemplify the law as applied to one class of subject he could not have selected more suitable instances. His third plate is a noble representation showing the surviving example of the ornamental termination to the marble tiles on each flank of the Parthenon, and which is in size two-thirds of the original. VULLIAMY is careful in this as in many other cases to give sections which enable us to realise the skill which was taken with the details. In the steles which could be closely examined the leaves are pointed, but in the Parthenon example of the anthemion they are boldly rounded and the leaves are so connected as almost to appear as if they formed a large palm leaf.

The cymatium of the cornice of the portico at the Erechtheum shows a new arrangement of the anthemion. It is interesting to compare this with the necking of the capitals in the building, for in the latter some elements are omitted in order to obviate overcrowding. A splendid scroll is given from the Choragic monument of LYSICRATES. An antique fragment which may have been part of a triangular panel indicates the tact with which spaces could be decorated, and the character of the ornament is more full than in earlier examples. The cresting of a tomb shows a new application of the anthemion, and the introduction of a bird picking at a leaf is an instance of license which is rare in Greek work, and which few would dare to censure. Various terra-cotta fragments reveal that the material was treated in the same way as stone. The capitals from Priene vary a little from the Athenian examples. The two griffins as supporters of a symbol are curious, and might, like the lions at Mycenæ, have possessed heraldic signification. In the capitals from Branchidæ one has a winged girl instead of the anthemion. But in other plates it appears, although with deviations from the normal form. In a frieze from the same temple the anthemion is combined with lions and griffins.

The ornament on an antique chair of white marble in the church of St. Stefano Rotondo, Rome, will be generally considered as Greek work. It is beautiful, and reminiscent of Athens. Nevertheless, there are many changes and there is still shown a wonderful respect for symmetry. A rose and coffer from the soffit of the cornice of the Temple of Castor and Pollux, Rome, although about 4 inches in projection and vigorously modelled, suggests a resemblance between the leaves which might have been produced by the aid of a machine. A large semicircular panel of white marble which VULLIAMY found in the Mattei Palace can be regarded as an example of composition. There is a central part which is united with the two sideparts. In the rosettes there are some slight differences, but the whole is remarkable for its unity. The final plate is a part of the frieze of the Temple of the Sun, which is one of the most successful instances of ancient decoration.

It is not advisable to make drawings of ornament or any other subject from engravings. Yet few would care to condemn an attempt to imitate the fine lining of HENRY MOSES. From the size of the plates the details are clear, and as the proportions between the engravings and the originals are stated a student could adopt a different scale. The subjects are not only models of Classic ornament, but where casts are not available the plates can be used as exercises in drawing. It is not necessary in our time that a Renaissance building

should display scrupulous fidelity to Greek ornamentation. However, the old examples at least can form a basis for new arrangements, and on that account wise to endeavour to find out the principles which inspired the ancient artists. When we see Classic ornament still serving in humble buildings, and sometimes conferring an air of refinement on them, it becomes quite evident that the designers understood principles and acted on them rather than on momentary impulse.

### HOUSING IN SCOTLAND.

THE difference between Englishmen and Scots tenants of houses in towns was long ago pointed out by Robert Chambers. An Englishman, he said, has really a strong feeling about his house—it is his castle—he never will abandon the fort so long as he can possess it. "The Scotch, on the contrary," according to Chambers, "are an eminently migratory people. They never are three months in any house till they wish the annual term-day were over or at hand, when they might remove to another. It is of no use that expectation is constantly showing how vain are their expectations of better lodgings. Every disappointment seems to give them but a keener relish for a new attempt." This desire for change is not without its disadvantages. Both the tenants and the local authorities who are responsible for the taxes lose money by the irregularities of the tenancies.

A departmental committee was accordingly appointed last November to inquire into alleged grievances in connection with the letting of working men's dwellings in Scotland; or, as interpreted by the committee, dwellings that were not let at a higher rent than 20s. The committee have prepared a report, from which it appears that in Scotland there is practically only one day for removals, viz. May 28, while in England it is said removals take place practically all the year round.

It is admitted by almost all the witnesses that the system of one removal term involves inconvenience and extra expense to tenants, and loss to those engaged in building trades. Before the May term there is great pressure to have new houses finished by the term, soon resulting in scamped work. On the term day the demand for means of conveyance is beyond the supply, leading to high prices and delay, and soon after the term the corresponding slackness in the building trades. In England such drawbacks are unknown. In both countries the original practice was probably that of long lets, with people having gardens attached to their houses and being less migratory. As workmen became less fixed in place, and as workmen's houses ceased to have gardens, the reasons for long lets disappeared. In Scotland, however, although short lets seem to be increasing in places, the general shortening of lets has not followed. In England short lets for ordinary working men's dwellings are well nigh universal, and the tendency is to let quarterly and monthly lets into weekly. In Scotland, on the other hand, where industrial undertakings on a large scale are of more recent growth than in England, short lets are to be found in the cheapest houses and usually in inferior properties. One reason contributing largely to the difference is that in Scotland, while a landlord who lets houses on any tenure up to 4l. or 5l. (varying according to the locality) has to pay the whole burgh taxes on the houses, he gets a substantial allowance for so doing in the case of short lets above 4l. or 5l. he has to pay the "owners' rates," but also the burgh rates primarily on the occupiers, without getting any allowance for the cost of collection or for losses. The same rule applies to council taxes, with the aggravation that owners of houses not only get no allowance for cost of collection, but occupiers' rates or for losses, but are also charged for on unlet property. In England it may be said generally (a) when owners pay tenants' taxes they always get an allowance, and (b) they do not pay rates upon unlet property unless by agreement, in which case a further abatement is made.

It was said by some of the landlord witnesses that the present agitation in favour of short lets is due to the influence of English workmen in Scotland. The English negatives this idea, but proves at the same time

able opinion of the English system formed by Scotchmen who have worked in England, and who have householders and ratepayers there, has strengthened demand in Scotland for short lets. It has also been tested that the agitation for short lets is only a part of a general socialistic programme. We cannot endorse this.

The matter, in our view, has been taken up on its merits, without ulterior views.

It appears also that workmen occasionally in their effort to obtain a house which suits them have to pay rent for two houses. The rating authorities, owing to the rates, really derive no payments for a great many houses, for apparently in some towns rates are collected only once a year. The committee have come to the conclusion to offer the following recommendations for the benefit of occupiers as well as owners:—

1. That no agreements for tenancy of such houses, verbal or written, made more than two months prior to the date of the agreement, shall be binding.

2. That it shall be sufficient, in weekly lets of such houses, to give three days' notice; in monthly lets, one month's notice; and in all other lets one month's notice of termination of tenancy.

3. That weekly lets of such houses shall terminate on a day and other lets on the 28th of the last month of the tenancy of the let.

4. That the stamp duty exigible on agreements of let for more than a year of such houses shall be one penny.

5. That in all cases where owners are liable, under the Rating or Local Acts, for occupiers' rates on such houses let for less than a year, they shall be entitled to an allowance for cost of collection and risk of loss, the amount thereof to be fixed, failing agreement, by the sheriff of the county, subject to a right of appeal by the owners to one of the divisions of the Court of Session, the rating authority being bound in all cases, at the end of one year after the allowance has been fixed, to collect the rates direct from the occupiers.

6. That in all cases where owners are liable for occupiers' rates on such houses, such rates shall be charged only for the period during which the houses have been occupied; in the event of rates of such houses having been paid for a period during which a house was unoccupied, the owner shall be entitled to have the same refunded at the end of the assessment year.

7. That in all cases where occupiers' rates of such houses are collected from owners, the owners shall be entitled to recover the rates from the occupiers without deduction, and shall have the same remedies for recovery of rates, or interest and rates, as for recovery of rent.

8. That in all cases where occupiers' rates of such houses are collected from owners, the rating authorities shall send each occupier annually a notice showing all occupiers' rates.

9. That all rating authorities shall be empowered to require payment of tenants' rates on such houses by such instalments and at such times as they shall think reasonable.

10. That where occupiers' rates on such houses are collected by the rating authority from the occupiers, all tenants shall be liable for their proportion of the rates for the year, whether their names are on the assessment roll or not.

11. That in all cases of payment of occupiers' rates of such houses, whether the same be paid directly by the occupier or through the owner, the rating authority shall be empowered to remit the whole or part of the rate on the ground of the occupier's poverty. If the rate has been already paid, and the local authority resolves to exempt the occupier in whole or in part, the rate or the part remitted, less the commuted allowance, shall be paid by the rating authority to the occupier.

12. That actions of summary ejection of tenants of such houses shall be competent in all burgh courts as well as in sheriff courts.

13. That in actions of ejection no delay beyond forty-eight hours shall be granted by the sheriff or magistrate to the occupiers of such houses, unless on cause shown, and no other delay is granted it shall be on condition of caution and signation, unless the sheriff or magistrate is satisfied that such condition ought not to be imposed, he being bound to state in the order allowing delay the specific ground on account of which he grants delay.

14. That the furniture and plenishing of tenants of such houses shall be exempt from the diligence of all creditors for debts, including rent, taxes and rates, to the market value of 10s. in addition to bedding, wearing apparel, tools and implements of trade.

## BUCKLEBURY AND ITS OWNERS.\*

THE selection of Bucklebury, so rich in literary and historical associations, was a happy inspiration on the part of the Berks Archæological Society, but we find it rather difficult to put into concise form the many interesting circumstances connected with its annals, although it can show so many striking evidences of its former importance. For many centuries previous to the dissolution of the monasteries the manor formed part of the extensive possessions of the mitred Abbot of Reading, who presided over one of the richest monastic foundations in the kingdom. On the suppression of the religious houses it was granted, with the adjoining manor of Thatcham and the revenues of these churches, to John Winchcombe, son of the famous clothier, and popularly known as Jack of Newbury. This worthy Jack of Newbury, whose name and deeds are of world-wide celebrity, is said to have been a native of Winchcombe, in Gloucestershire, in the registers of which parish are entries referring to the family of Smalwode, or Winchcombe, his adopted name. The grant of Bucklebury to John Winchcombe, including the manor of Thatcham, is dated 1541, the consideration money being 2,619*l.* 13*s.* 4*d.*, equal to about 25,000*l.*, according to the present value of money; it cannot therefore be said that the grantee, like numerous others, shared very largely in the spoils of the alienated Church lands on very easy terms. This John Winchcombe, probably owing to the patriotic zeal of his renowned father, commanded considerable influence at the Court of Henry VIII., and was an important and opulent person living at Newbury, where he continued to reside until his death. He represented the borough of Reading in Parliament in 1552-3, and held considerable estates in this county, including the manors of Gynge, Lockinge and Frampton, in East Hendred, and the manor of Farnborough, which had belonged to Abingdon Abbey, but was purchased by Winchcombe from Edmund Fettiplace in 1543. On acquiring the Bucklebury estate the grantee took down the ancient Grange, which had been so long associated with the great ecclesiastical body at Reading, who owned nearly all the property in the Kennet Valley, and built the country gentleman's mansion which stood on this memorable spot for many generations. He died, probably before the house was fully completed, December 2, 1557, and was buried in St. Mary's chantry chapel in Newbury Church, his distinguished father's resting-place. John Winchcombe, son of the grantee, who first went to reside at Bucklebury House, is described in 1559 as one of the gentry of Berks, and served the office of high sheriff of Berks in 1569. From the inquisition taken on his death in 1574 we learn that he held upwards of 3,000 acres of land in this county, and the advowsons of Bucklebury, Thatcham and Lockinge. He left a son, John, who was eighteen at his father's death, but apparently did not live to attain his majority. The Winchcombes also had an estate at Noke, near Islip, Oxfordshire. The manor of Henwick was also held by the Winchcombes, and was originally, like Bucklebury, a residence of the abbots of Reading—the names of the "Abbots' Grove" and the "Abbots' Graffe" still recording its early connection with the monastic régime. The Winchcombes had continued members of the "Old Religion," and John Winchcombe, of Henwick, grandson of the grantee of the manor of Bucklebury, was an ardent member of his Church. His name is reported by Robert Weston, one of the Government spies and informers, in 1591, as a receiver and harbourer of proscribed priests and others at his house at Henwick.

Francis Winchcombe was the next owner of the manor of Bucklebury. He was brother of John Winchcombe, who died under age, and served the office of high sheriff of the county in 1590 and again in 1606. He settled the greater part of his property in favour of his son Henry and his heirs male. He died at Bucklebury January 3, 1619. Henry Winchcombe, successor to his father, Francis, married Mary, daughter of William Wollascot, of Woolhampton, and with his brother William was, by the influence of Archbishop Laud, when they were students at Oxford, brought into conformity with the Church of England, as appears by the Archbishop's defence to the charges formulated against him previous to his trial and execution. On the death of Henry Winchcombe in 1629, and who was buried at Bucklebury, an inquisition was taken at Reading, when it appeared that besides Bucklebury and other estates

\* A paper read by Mr. Walter Money, F.S.A., at the visit of the Berks Archæological Society, and reprinted from the *Reading Mercury*.

he was entitled to the manor of Little or East Shefford and Wickfield Farm, expectant on the death of Lady Clarke, formerly the widow of William Winchcombe, another son of Francis Winchcombe, and elder brother of Henry Winchcombe. There is a monument to William Winchcombe in Little Wittenham Church, Lady Clarke being the daughter of Edmund Dunch, of this place, and married, as her second husband, Sir Edward Clarke, of Ardington. Upon the death of Henry Winchcombe he was succeeded by his son and heir, Henry, then of the age of eight years, and being a minor the estates came into the king's hands. He married, when a little over nineteen, Elizabeth Miller, only daughter and heiress of George Miller, of Swallowfield. He died in April 1643, and was buried at Bucklebury.

Bucklebury has many associations with the great Civil War, and just before the second battle of Newbury, the Parliamentary army, consisting of over 20,000 men under the command of Manchester, Cromwell, Waller and other prominent leaders, was encamped on the west end of the Common previous to their advance on the heights above Shaw.

The Winchcombes suffered much for their loyalty to King Charles I., and one of them, John Winchcombe, of Newbury, a recusant and malignant, was a very active and resolute Cavalier. His estates in Berks and Somerset were sequestered, and after the surrender of Newbury to the Parliament he sought shelter in Wales, where many of his descendants can still be traced. Several skirmishes took place between the opposing forces on the Common, and in the spring of 1644 there was a sharp encounter about half a mile south of the "Bladebone," on or near a piece of land called the "Forties," probably from some association with the fight. There are several entries in the registers as to the burial of soldiers, one of whom is recorded as having been "a soldier of the king slaine at Chappell Row." There also lies in Bucklebury Churchyard Lieutenant Richard Warde, an officer of the Parliament. Guy Carleton, afterwards Bishop of Chichester, was vicar of Bucklebury at this time, and being a very pronounced Royalist was seized and imprisoned in Lambeth House, whence he escaped by letting himself down through a window into a boat on the Thames by a cord secretly conveyed to him by his wife. The old vicarage is still standing on the western side of the churchyard.

Resuming the thread of our narrative, Henry Winchcombe, the third in succession, was an infant of six months old when his father died. He, too, contracted an early marriage and died a young man. His wife was Frances, daughter of Thomas Howard Earl of Berkshire, and was the foundress of the Blue Coat School at Thatcham. He was created a baronet in 1661, in consideration of the loyalty of his family, and died at the age of twenty-six in 1667, leaving his wife, Lady Frances Winchcombe, and one son, Henry Winchcombe, surviving him. Henry, the fourth in succession, was born in 1660, and at the time of his father's death was seven years old. During his minority the manor was held in trust by various persons. Among those acting as lords of the manor were Thomas Howard, William Backhouse, Richard Aldworth, Sir William Terrington and Dr. Richard Francis Hungerford. In 1681 Sir Henry Winchcombe, second baronet, came of age and entered into possession of the estate. He married twice. His first wife was Anne Hungerford, of the great Wiltshire family of this name, and secondly Miss Rolls. By his first wife he had one son, Henry, who predeceased him, and three daughters, namely, Frances, Elizabeth and Mary. By his second wife he had a daughter, Henrietta. Sir Henry represented Berkshire in Parliament in 1688-9, and, although blind from his youth, took an active part in the affairs of the country.

He died in 1703, and on his monument in Bucklebury Church, erected by his three daughters, there is a touching Latin inscription recording that "His eyes having been lost in youth, neither to public nor private duty was he wanting. He served the interests in Parliament of his country, at home of his friends. By promoting these he consoled himself for his calamity, and in tilling his fields, in repairing his property, he enjoyed himself in the country, truly with a great mind, zealously cultivating those things whose fruits he could not perceive in himself. To the best of parents Frances, Elizabeth, Mary, heiresses by his will, this monument is here placed."

Elizabeth Winchcombe, the second daughter, died on September 7, 1705, at the early age of twenty-three, and was buried in Bucklebury Church, where there is an inscribed gravestone over her remains.

Interesting as Bucklebury is, from its association with

the important religious foundation at Reading, and residence in after years of the Winchcombes and their successors, the old manor-house derives its chief world interest from the fact that it was for some time the home of the celebrated Henry St. John, first Viscount Bolingbroke, who married for his first wife Frances, daughter and heiress of Sir Henry Winchcombe.

In these old gardens many a beau and belle must have promenaded in the days of "Good Queen Anne" an early Hanoverian sovereigns, with wig, lappets and headed cane, or in stiff brocaded bodices, with flounced furbelows. We can almost see Pope's lean figure with the author of the most satirical romance the world has ever seen—"Gulliver's Travels"—along the old paths to enjoy a pipe on the little islet in the middle of one of the ancient fishponds, which village tradition ascribes to Bolingbroke's most favourite resort. Surely there is no spot in England where so much literary talent centred.

Owing to the course he had taken in Queen Anne's reign Bolingbroke, upon the accession of George I., was attainted of high treason and deprived of both his estates and titles. He escaped to France, where he entered the service of the Pretender, but was again unsuccessful. In 1723 he contrived to make his peace at home, and was restored to his estates but never to his titles. "lethalis arundo," the poisoned arrow, that rankled him, was his degradation from the House of Lords. His wife died in 1718, and he appears never to have returned to Bucklebury. After several years of able hostility Walpole he renounced politics and again returned to France, but upon his father's death came back and lived at Battersea. Mary, the younger sister of Viscount Bolingbroke, married Robert Packer of Shellingford, and thus the Donnington Castle estate became merged in that of Bucklebury.

Mr. Robert Packer was M.P. for the county of Berkshire in the Parliaments of 1710-13-15-22-27, succeeding to the office on the elevation of his brother-in-law, the Right Hon. Henry St. John, to the peerage. He resided at Shellingford, where there are some remains of the fine old manor-house. The last Sir Henry Winchcombe having died without male issue, the estates devolved on Sir Henry's eldest daughter Frances, wife of Lord Bolingbroke, and she left no child the property passed to her younger daughter Mary, wife of Robert Packer, of Shellingford, and to her son Winchcombe Howard Packer.

Mr. Winchcombe Howard Packer, who resided principally at Donnington Castle House, like his father, represented this county in Parliament. He received many of the chief wits and celebrities of the day at the Castle House, one of whom in a birthday ode describes him as "Patriot, generous and humane." He died at his house in Golden Square, then a fashionable locality, in the early age of forty-four, in 1746, and was buried in Bucklebury.

Henry John Packer, brother of Winchcombe Howard Packer, was the last male heir of the Packers, and dying two years after his brother, at the age of thirty-eight, devised Bucklebury and Donnington Castle estates to the son of his sister Elizabeth—Winchcombe Henry Hartley.

Mr. Hartley was the son of David Hartley, M.D., a philosopher and physician, by his second wife, Elizabeth Packer, daughter of Mr. Robert Packer, of Shellingford. Donnington Castle House, by Mary his wife, daughter and co-heir of the last Sir Henry Winchcombe, Bart. Hartley died at Bath in 1813 in his eighty-fourth year.

Miss Mary Hartley, sister of David Hartley, was universally admired for her accomplishments in literature and the fine arts.

Mr. Winchcombe Howard Hartley, who was Colonel of the Royal Gloucestershire Militia, and M.P. for the county of Berks in the Parliaments of 1774-80-90, died in 1790, leaving an only son, the Rev. Winchcombe Henry Hartley, vicar of Bucklebury. Mr. Hartley died in 1833, leaving a son, Winchcombe Henry Howard Hartley, colonel of the Gloucestershire Militia, and high sheriff of Berks in 1834. He also had a daughter, Elizabeth Ann, who married the Count Palatino, a Greek noble, who fought in the War of Independence. Shortly after Mr. W. H. H. Hartley came into possession of the manor, in 1833, the grand old Elizabethan house having been found to be somewhat out of repair and damaged by fire, was pulled down and the material sold by auction. It was described as a spacious mansion consisting of a centre with wings on either side, the main part being large and ornamented with panelling and carved

imney-pieces extending to the ceilings. There was also long picture-gallery like that at Littlecote and other houses of the Tudor period. The remains now left are a small portion of the wings and a spacious lofty kitchen, said to have been added by Lord Bolingbroke, and a coach-house with extensive stabling. On the death of Mr. Hartley, in 1811, the estates in Berks and Gloucestershire descended to his co-heiresses—the Countess de Palatiano, Mrs. Weeley-Parry, Mrs. Acreman White and Mrs. Charles Russell—but the partition of the estates has recently (1906) been carried out, and Mrs. Weeley-Parry is now the lady of the ancient manor of Bucklebury.

A part of Bucklebury is called Chapel Row, from an ancient chapel which stood on Chapel Row Hill, and the site now forms part of the glebe land belonging to the vicar of the parish.

The far-famed Chapel Row Revel was held on the Monday after St. Anne's Day, July 26, and was celebrated with the backwording displays which took place on these occasions. The Lords of the Manor of Bucklebury gave five guineas yearly, and subscriptions were raised in the neighbourhood for other prizes. These comprised a goldcocked hat, value a guinea and a half, for old gamesters, and one value 25s. for young gamesters, a hat and blue cockade, and a still inferior hat without a cockade. The combatants fought on a raised platform of earth called the butts, bareheaded, with the left hand fastened to the waist, so that they might not use it to ward off the blows. The revels were suppressed many years since on account of a man being killed in one of the encounters.

The noble oak avenue is over a mile in length, and some of the trees are of gigantic growth and of most picturesque character. There is a tradition that the trees were planted to commemorate a visit of Queen Anne to Bucklebury, but it is far more probable they have some association with a visit of Queen Elizabeth. The queen certainly visited Mr. Henry Winchcombe at Newbury in 1568, and she may have taken Bucklebury on her road from Englefield. However this may be, this great avenue was planted as an approach to the old mansion, and from the "Bladebone" as continued down Chapel Row Hill, several fine oaks corresponding to those in the avenue still standing by the side of the road, and the site of the entrance gate to the old manor-house can still be seen.

The outer line of trees was planted to commemorate the victory of Waterloo in 1815, also those with mounds round them by Nuttage Gate. The late Mr. W. H. H. Hartley mentioned to the writer that when his grandfather came to the estate many of the oldest and most venerable of the oaks on the estate must have dated back to a time anterior to the dissolution of Reading Abbey, and there are still a few of these patriarchs of the grove remaining. It is also worthy of record that the longest and finest mast ever turned out at Portsmouth Dockyard was cut from an oak grown on the Bucklebury estate. At this time, when British oak was in such demand for the "wooden walls of old England," Mr. Hartley was offered an immense sum for the whole of the trees in the avenue, but he nobly refused to destroy what time had consecrated and the hand of taste displayed by his ancestors had preserved from spoliation.

### CELTIC ART.

At a meeting of the Art Section of the Pan-Celtic Congress Professor Patrick Geddes, in opening the proceedings, said it had been a question whether there was any Celtic art at all; for while there were circles and megaliths and sculptures of Celtic origin, it was asked how far they belonged to earlier peoples. They had many admirable monographs on Scottish, Irish and Breton Celtic remains. What he thought they wanted was a volume—"A Monumenta Celtica"—which would bring before them in simple, intelligible form some outline of this great heritage. Old Celtic art was, he believed, capable of modern development. In this connection the Professor referred to the new Edinburgh Art School. Those in charge, he said, had got plenty of money, a site, and a royal personage to lay the foundation-stone. The artist would be advertised for. Art needed inspiration. They had not lost the sculptural art, but it had been debased. In Aberdeen, for example, they had lost the art of dealing with granite, and it was for the Celtic artist to arise and regenerate and civilise it.

The Countess Plunkett read a paper on "The Development of Irish Ornament." She said she came from a country that she believed she might call the mother country

of the Gael. Alas! that the battle of races left their ancient civilisation prostrate and wrecked, the remains of which not only they, but all their kith and kin, should be proud of. But for all the victory of ignorant force, Ireland was still the treasury of Gaelic art, Gaelic history and Gaelic literature. The Royal Irish Academy, as trustee for the nation, late though it was, began to bring together the materials from which to reconstruct their past. They retained in their custody MSS. that the scholars of Europe visited Ireland to study, and they had transferred to the Dublin Museum the greatest collection of Celtic art in existence. The Celtic feeling for art found opportunities for expression principally in three or four ways—in monumental work, in personal ornament and domestic utensils, and in warlike and other instruments. While for these various purposes their artists sometimes drew from a common fund of design, they usually differentiated according to use, so that they found styles distinctly associated with particular intention. It was interesting to observe how scrupulously the Irish artist fitted his decoration to his material. When he worked in bronze—on a shield, for example—his figures were bold and salient; while on a pin they were delicate, yet fairly simple. When he wrought in gold nothing could be too elaborate. When he illuminated his design was intricate and his colour-scheme restrained. When he carved, he sometimes covered the stone with one all-embracing interlaced device, but more frequently he built up his monument with a variety of fancies, all striking, yet all in harmony, and contrasted squares with circles, angles with curves. This variation of treatment had led a few writers to hastily conclude that the different styles in Ireland could be strictly limited to periods and be easily traced to their sources. Even Miss Stokes seemed to think that the *opus Hibernicum* was introduced into Ireland by the Christian missionaries. Other less careful thinkers, accepting as gospel the speculations of recent authors, would hand over much of the work of native Irish artists to a mythical or semi-mythical Italian guild. They were told that their interlaced work should not be claimed as Irish; that it was out of harmony with their native ideas, which showed their vigorous simplicity in the work of the La Tene period altogether free from the laboured formalism of Christian art. These speculations were without evidence. They were against Irish tradition. That interlacing, the trumpet pattern, the working of figures into intricate ornament could not be segregated exclusively to any one section of humanity must be conceded by all. But race individuality showed itself in most matters of art; and that, the Countess contended, was the case in Ireland in connection with this particular form of design. Her Ladyship touched on the style "of a broader and bolder character, to which little attention had been paid, but which was yet most undeniably their own." She referred to the patterns executed in bronze belonging to the La Tene period. Take, for example, an Irish shield of this time; see its splendid relief, its simple unity of effect, the fluency, so to speak, of its unerring lines. Anyone not familiar with Celtic art would readily be misled into prizing some of this work as belonging to the greatest period of Greek decoration. The saliency and freshness of its design suggested that it belonged to a creative time, though the handling and finish were perfect, and evidently the result of much training. Artwork in jewellery, gold and bronze were noticed by Lady Plunkett, and praised for their craftsmanship; the work on the great crosses was also illustrated, as also, as another evidence of artistic feeling and a sense of the fitness of things, the outline of objects. In conclusion the Countess said:—"Some people treat Celtic art as one of the charming things, fresh and spontaneous, produced in the childhood of the world. In a sense it is so, for certainly the Irish artist delighted in the work of his hands. Nevertheless, many of the works in our museum, aye, and on our hillsides, are among the world's triumphs of execution. No jewellery of the Italian Renaissance could surpass in technical merit the Tara brooch, the cross of Cong, the chalice of Ardagh. The people whose literature and folklore glorified the past, who made wise men their rulers, who made their weapons of war beautiful, who gave splendour to their churches, who would conquer the world either by force of arms or with the sword of the spirit—these were hardly the people to have to wait for the 'civilising' influence of the Anglo-Norman. And through the long ages of darkness they lived and loved and wrought by the flame lit by Patrick and Brigit; and to-day in the wild West, and the fastnesses of Donegal, and the wooded heights of Kerry, their lives are made gentle and sweet and their hearts kept warm and pure by the wholesome traditions of their race."

## NOTES AND COMMENTS.

THERE is so general a belief that architects' estimates are sure to be exceeded when the works are carried out, it is satisfactory to be able to record that the Birmingham education committee have testified that the total cost of the GEORGE DIXON elementary and secondary schools has been slightly less than the contract sum. It appears that water was struck at an early stage of the original plans, and the committee had to arrange for a further loan of 1,200*l.*, which they feared would be swallowed up in the foundations. But after very careful watching by the architect, the clerk of the works and the surveyor, they had come out of this contract with a slight saving. They had built the gymnasium in the usual way and had done a considerable number of things, amounting to 230*l.*, quite apart from the original building, without having touched the 1,200*l.* for the extra foundations.

THE National Society of French Architects has contemplated a petition to the French Government authorising the removal of the remains of CHARLES GARNIER to the Panthéon. There is no doubt that the architect has a rightful claim to be numbered among the great men for whose services the Panthéon was erected as a general memorial. But GARNIER had already designed a modest tomb for himself and his family in the cemetery of Montparnasse, where so many inhabitants of the Quartier Latin are at rest. Madame GARNIER has regularly visited the spot, and must therefore entertain an affection for it. Accordingly she, while recognising the spirit which prompted the architects' project, hesitates about approving of the change. There is no doubt her wishes will be respected, and there is indeed no necessity for a change in order to fix CHARLES GARNIER's position as a French architect.

THE Americans owe much of their success to technical publications which they are able to value. As there is a demand there is a supply which is remarkable both for quantity and quality. One of the latest publications is a digest of current technical information which has for title "Technical Literature." It is issued from New York, but Messrs. ARCHIBALD CONSTABLE & Co., LTD., are the London agents. It gives selected papers read before technical societies as well as articles and extracts from technical publications and books. From the pages it is easy to realise the efforts which have been made for the advance of practical science in all departments.

ROYAL ARMY MEDICAL COLLEGE, WESTMINSTER.

WHITEHALL HOUSE, CHARING CROSS.

PREMISES, NO. 20 CONDUIT STREET, W.

GEORGE PALMER COUNCIL SCHOOLS, BASINGSTOKE ROAD, READING.

THE site is situated on high ground in the Basingstoke Road, and is a long and narrow one about 550 feet by 158 feet. The ground originally was very sloping, and it was found necessary to practically level the whole surface. Considerable difficulty was experienced in making the foundations for the heating chambers, owing to springs which were constantly running at that level. By constant pumping the water was kept under and the chambers were constructed like tanks, the whole of the external portions being cased with asphalt 1 inch thick. Agricultural drains were constructed all round and finally taken into a drain, and from thence to the main surface water drain in the Basingstoke Road, which luckily was just deep enough for the purpose. Many interesting specimens of shells were found in the lower excavations, some of them being in large masses.

The buildings have been arranged in four principal blocks, the first being for infants and junior mixed;

the second for a domestic centre; the third for intermediate and senior mixed; and the fourth for a man instruction centre. Each main block is designed on the central hall system, with classrooms on three sides of the first block having on ground floor a central hall and seven classrooms of various sizes, with ample cloakroom and lavatory accommodation. On this floor is a room for the head-master, overlooking the playground, and in the mezzanine rooms for male and female teachers, &c. On the first floor the accommodation is repeated. The great feature on each floor is that by folding back the partitions at each end two classrooms can be thrown into the central hall when required, thus increasing the length of halls by 42 feet, or 90 feet in all. The other main block for the intermediate and senior mixed is arranged in a similar manner, but with the addition of a drawing classroom on the ground floor and a science room on the first floor. The central hall on the ground floor of this block can be made nearly 100 feet long when required, for examinations, &c. A system of fire drill is taught in all the schools of the borough, and is tested by occasional false alarms, and the children could be got out of the buildings within two minutes of an alarm fire being given. Fire hydrants are provided in various parts of the buildings with lengths of hose attached.

In all cases there is ample window space, and every classroom has the light coming from the left, all heavy bars tending to obstruct the light being omitted. Electric light is laid on throughout, and electric fans are used where required. The ventilation is of a very simple nature, and, after many expensive experiments in the London schools, has been found to answer better than any other. All windows are provided with double sash pieces, so that by raising the lower part of sash fresh air comes in above the middle rail like a Tobin tube. The upper part of most windows is made to fall back and in addition two or more large Tobin tubes are placed in the angles of each classroom. The vitiated air passes away through large gratings taken in at separate air flues in each shaft.

The domestic centre contains on the ground floor a classroom, kitchen, scullery, parlour and bedroom, &c., for demonstrating instruction in housewifery. On the first floor a cooking classroom and scullery attached for instruction in cookery, &c.; also a laundry for instruction in washing, ironing, &c. The manual instruction centre, or technical block, contains the engineering room, fitted up with all modern appliances.

The carpenter's shop is fitted up with benches, &c., and is up to date in every way. Ample light is provided on three sides, and in addition top light in required positions. The shops are well ventilated.

The playgrounds, which will be asphalted, have covered playsheds, cycle houses and various blocks of latrines. There are many very fine old trees on the site and they have been kept intact. Internally the walls are fair brickwork, coloured a pale green tint and dado dark brown. The dados to halls, corridors, staircases, &c., are in glazed brickwork. Externally the buildings are of dark red bricks from a local firm, with Douling stone dressings.

The schools generally will accommodate about 1,400 children. The contractors were Messrs. HARRIS & SON, of Great Marlow, Bucks, the general foreman being Mr. H. FRITH. The heating contractors were Messrs. DINNING & COOKE, of Newcastle-on-Tyne, under the supervision of Mr. GEORGE WHITE, permanent clerk of the works to the education committee. The mechanical school machinery was supplied by Messrs. MACKIE & SON, LTD., Reading, and the electric wiring, &c., by the Reading Electric Supply Company, Ltd. Mr. J. HASTRICK made an admirable clerk of the works. The architect is Mr. GEO. W. WEBB, F.R.I.B.A., Marlborough Place Chambers, Reading. We shall publish the set of plans in connection with these interesting schools in our issue of October 11.

CATHEDRAL SERIES.—SOUTHWARK: THE NAVE FROM THE CHANCEL.

# R. NORMAN SHAW, R.A., ON THE HOUSES OF PARLIAMENT.

select Committee of the House of Lords, before submitting their report on the Palace of Westminster, evidence from Mr. R. Norman Shaw as follows:—

*Lord Stanmore, Chairman.*

I believe, very well acquainted with this building, very.

have considered from all points of view its capacity and the conditions of decoration which are most desirable?—Yes, to a very considerable extent.

You perused the evidence given by other witnesses at the committee last session?—Not in full detail. I have seen the Blue-book of the evidence this morning. I asked the question because it might have shortened the time had been able to refer to portions of the evidence, and I am sure you whether you agreed or disagreed with the evidence made by other gentlemen. The first question I asked you is with regard to the architectural character of the building. You are aware, I believe, that in the designs of Sir Charles Barry for the House of Commons, quite the same as those which were finally adopted?—Quite so.

As to say, Sir Charles Barry had broken up the space a good deal more with architectural decoration, and more arcading than is now the case, the Fine Art Commission having desired large rectangular spaces to be set aside for pictures?—Yes.

In your opinion as an architect would it now be desirable if we are considering the further decoration of the building to revert in any degree or in any places to the design of having more architectural detail and spaces, or would you preserve the large spaces as they stand?—I should be very much indeed against that. It appears to me that if anything is to be done in this building it is repose and blank wall, and to change these places with fresh tracery and panels should consider, be simply going on wrong lines. It would be entirely towards simplicity and restfulness could arrive at those very good qualities, as I think it is. I would have no sort of elaboration, because it seems to my mind does not call for elaboration. It seems to me to be quite elaborate enough. If we could get more repose and more restful I should be more happy.

We have your view upon that point very clearly. Another point upon which I should like to have your opinion as an eminent architect, and as being well acquainted with the building, is this:—We have been told that the building, if it has a fault, is that it does not provide for expansion?—Yes.

Is it a fault that it shares in common with many other buildings?—Yes.

As a result of that is that many of the spaces which were devoted to art are now devoted to utility?—Yes. The spaces which were intended to be painted are covered by big cases for books and cloaks and things of that kind, and unsightly erections in the shape of telephone boxes put up in front of frescoes, fine architectural details and mantelpieces, which are really of a very good character, are deformed by being turned into a round of a large table covered with black bottles and twiches, and so on. How would you propose to provide for these additional needs without deteriorating the architectural features of the building, or interfering with the spaces which it is wished to devote to decoration?—I think there is no place can this building be described as being either as regards the buildings in the courts or on the river front, and I think a great deal might possibly be gained by getting an extra floor in parts of the building. I begin, perhaps, as being safer on the whole, with the spaces, where you might move some of these refreshment-halls, and certain departments perhaps might be added, in fact, more room—what is wanted is more

not almost a fatal objection to that idea that you have these appliances and appurtenances on a higher floor, and consequently there would be considerable inconvenience in having to go up and down stairs?—Yes, that would be a question you would have to consider. It seemed to me that that there might be a good deal of clerical departments which could be put up there very easily enough. It is not as if we were dealing with a storey building. The heights at the present moment are modest indeed in comparison with modern requirements, and there are such things as lifts. In that way you

might be able to do away with the buffets with these black bottles which it is extremely painful to see in front of the frescoes. I should think there would be no difficulty in moving a moderate-sized refreshment bar up a flight of stairs and clearing the bottles in the buffet out of the way. Of course, that would require a great deal of consideration; you cannot extend the building in area, because it is quite big enough, and also because you have no ground to extend it upon, but you certainly could extend it in height to a very great extent, and I am not at all sure that the building might not gain very much by that.

If it were only a matter of clerical accommodation, I should say that the expedient you mention would commend itself to everybody, but you must remember that these needs for which we have to provide are things which are required in haste, and therefore it would be desirable that they should be on the same floor—I mean such things as telephone boxes, post offices and even refreshments—people rush out in a hurry to get a bun and go back again to the committee-rooms, for instance, and they would not like to go up a high flight of stairs for the purpose?—Certainly not. On the other hand, there are rooms such as this in which we are sitting now—large committee-rooms—as to which I do not see that there would be any very great hardship if the room were on a higher floor. You might get a nice suite of rooms on a higher floor with waiting-rooms, and everything that you could want, quite compact and comfortable, with plenty of space.

Would not the increased height seriously interfere with the architectural character of the building?—At this present moment I think possibly it might be a gain. If the building has a fault it is that it is exceedingly long and rather low for its height. The frontage is 650 feet, and practically it is only three storeys high, or you may say two storeys and a ground floor—a semi-basement. I cannot see how anyone could suggest that the building is over done with height at present. You will remember I am giving you only a hastily expressed opinion; you must take it for what it is worth.

Your recommendation, speaking generally, is that we should provide as far as possible on a higher floor for these necessities?—For the things that could be removed. I think if you had a fine high roof over this central block it would be very impressive. I do not think the building would lose by it.

How would you work that in with the central lantern?—It would go up in front of the central lantern. The central lantern would show itself up behind.

It would dwarf it, would it not—you would not see the lower storey at all?—I do not think that the central lantern is the happiest part of the building—if I may say so.

Of course I am not asking you to give me a plan of the new building you suggest?—No. You will understand this is only a hasty suggestion. I think it might be the means of giving you, what I take it is certainly wanted, a great deal of extra accommodation.

You do not think anything could be done in the courts by way of giving further accommodation in that way?—I think you would lose very materially if you tamper in any way with the light; light, of course, is such a very important thing. I think many of the back buildings might be heightened certainly; you might get a floor in perfectly well, and perhaps it would be more easy to do it there than here, because the rooms are not so high at the back part as these rooms.

It would interfere less with the general design of the building, would it not? It certainly would not interfere with the outside of the building at all, and it would give you a lot of room if you heightened these places by another floor. You would get a great deal of room in that way.

Might not something be done by projecting oriels?—Not to any material extent, I think. For instance, to take this room, if you turn those two windows into oriels, of course the room would be larger by those oriels, but the extra space would hardly be available for practical purposes.

I was thinking of such things as telephone boxes, which do not take up much space; might they not be put into some recess?—In nine cases out of ten I think a telephone-box might be got in the thickness of the wall. The walls are a good thickness, or at all events the part that projects might be reduced from about 3 feet, as it is now, to perhaps 1 foot, which, of course, would work no serious drawback at all.

*Earl of Carlisle.*

I should like you to say (if it is not too large a question) what is your general view of the character of the building—whether it is really a worthy and admirable specimen of

architecture, and whether, therefore, it deserves not to be neglected, but to be treated in such a way as to bring out whatsoever excellences it may have?—My opinion of the building is the very highest. I have known it intimately—more intimately fifty years ago even than I do now—and I have never wavered in my admiration for it. It is a most interesting building; and it was a perfectly marvellous building, considering when it was done and all the circumstances attaching to it. I have had the greatest possible enthusiasm for the building for the last fifty years, and I am not going to change my opinion now in my extreme old age.

I asked that question particularly because some time ago, not long after it was built, it was subjected to a great deal of attack and severe criticism owing to its style, because at present no doubt the fashion of architecture has gone in other directions. Therefore, it seems to me, people are perhaps liable not to appreciate the qualities of the building at the present time?—No doubt that is so; but you must remember that people generally are profoundly ignorant and know nothing about it; and that applies not only to the ordinary man—the man in the street, as he is called—but it goes a long way beyond him: it applies sometimes to people who are trained, though in their cases it becomes prejudice.

That is exactly why I was anxious to have your opinion upon the point.—I am happy to say I have no desire to change the opinion I have expressed of entire enthusiasm for the building.

In your opinion might the appearance of the interior, taking this room for instance, be very largely improved by treatment merely—for instance, in your opinion has the appearance of this room and other parts of the House been very greatly damaged by injudicious furnishing and surface treatment?—I must say I think this is a very ugly room. If you were to revert to what I was talking about just now, simplicity and restfulness, do you not think it would be much pleasanter if the panels on this wall were all obliterated and we had a plain wall? That is to say, if all that woodwork were taken bodily away, and we had plain colour or something of that kind or a good paper pattern, treating it as one great wall.

*Chairman.*

But these panels were meant for pictures, were they not?—Do you think that it was seriously meant to put pictures in this room?

Yes, I think so, certainly.—I should be very sorry to be the painter.

*Earl of Carlisle.*

The dining-room further on has been treated by removing the varnish from the wood and by whitening the ceiling. Have you seen that room?—I have not seen it.

That is in the direction that you would recommend, is it not?—That is in the direction of simplicity and restfulness—I have no doubt you would find that room more restful than this.

You think a great deal could be done in that way?—A very great deal could be done in that way.

I do not know whether you have noticed in the House of Commons lobby the statue of Sir William Harcourt, which is put on a pedestal and has been slightly tinted with, as it seems to me, very advantageous effect as compared to the other statues?—As compared to the dead-white statues?

Yes. Should you advise that process to be continued?—I have not seen that statue, but, of course, there is no doubt that a dead-white statue against a stone wall is rather repellent. I was looking at Westminster Hall as I came up just now. I believe in Westminster Hall, for instance, a panel of some simple material would go a long way towards making that more comfortable.

What would you recommend there?—I should try a panel, say, 6 feet wide, running the whole height from the floor up to the cornice, of some nice, good, low-toned material. That I suggest as a mere experiment. You would find, I think, that the statues would look infinitely better against a background of that kind.

What sort of material do you mean?—I should try a common sixpenny curtain material—it is simply colour that you want. Distemper would do perfectly well. I think that a background is the most essential part, and we lose sight of that to an extent that is perfectly amazing. I do not know whether you remember Gérôme's wonderful statue of *Bellona* at the Paris Exhibition. It looked splendid.

It was also in the Academy, was it not?—Exactly, but you will remember how it looked in the Academy. It was

placed there, as I venture to think, without an altogether good background. It had as a background a hideous marble door—whole quantity of confused little pictures in the background, with a deplorable result. I know I look at that statue in the Academy in despair. It was simply a question of placing it. If it had been properly treated had a nice background—it ought to have looked just as it did in Paris.

Among the witnesses who have given evidence to this committee there were some who recommended tapestry, in fact, that used to be the historical decoration of the House of Lords at one time. Do you think that your experience that tapestry, however beautiful the material, is well adapted for the London House of Commons?—Emphatically no. It would perish, and perish rapidly, as our window curtains perish. I am not a chemist, but I do not know precisely, but I suppose it is due to its being in the air. I should think tapestry would be a very bad thing to embark upon.

So that you would rather recommend distemper?—Price, of course, is rather different.

*Chairman.*

The old tapestry in the House of Lords many centuries ago, some centuries, did it not?—Yes, and pieces of it manage to last now, no doubt. There is plenty of it all over the world, and it is beautiful and delicate. There is nothing so magnificent, but in the first place the cost is very nearly prohibitory now.

We have had rather contradictory evidence as to the cost?—If you started with tapestry I could not say what it would cost, but you must, of course, first have a fair chance to copy in tapestry, and it is, I think, exceedingly difficult stuff to make now.

Some of the witnesses before us have suggested other means of decoration, especially for St. Stephen's Hall, the panels there might be filled in, not with the material for which they were intended, but with marble or different coloured marbles, such as one has seen in Italian buildings and churches. Looking at it from an architectural point of view as merely harmonising with the architecture, what is your view about that?—It would be very risky and very doubtful. You are introducing an entirely new material, and a material not very well suited to English architecture.

Another suggestion made by some of the witnesses is the use of coloured relief or gesso. How does that look to you?—It is very difficult. All gesso-work has a tendency to be distinctly showy, and it is rather away from the object of being showy. I do not want to make the place more showy, but to make it simpler if possible. Gesso is distinct work because, of course, the light catches every part of it. Of course, it is very beautiful and superb in its own place, but I think it requires to be skilfully done.

*Earl Beauchamp.*

We have had some evidence with regard to the use of plaster which should be used in this work here rather than one artist has recommended lime plaster and gypsum plaster—could you tell us anything about the point?—No, I am not sufficiently a chemist to speak of it.

Have you had no experience in regard to plaster?—We have used gypsum plaster.

Then how is it there is so much gypsum plaster in the building—which is the most common?—Gypsum plaster decidedly.

It has better colour, has it not?—We use lime plaster generally for internal work and it is highly perishable, covered over with paper, and that prevents the air from acting directly upon it. I suppose other acids in the air would act upon lime plaster at least as much as it has done upon the frescoes—there is a tendency there to split off the surface.

That is with the gypsum plaster, is it?—No, I have never used for the frescoes.

It really depends upon how the lime is mixed with the sand?—Yes.

When it is properly mixed by experts the lime plaster does not only give a very good colour, but it is also very durable and it gets harder from year to year?—Yes, and it resists the acids in the air. Of course, here the plaster is in its infancy, and it would do far better at the end of fifty years, but that is when it is not subjected to our atmosphere. It hardens very much slower—it takes a long time to harden. We know that lime plaster was used by the Romans. What they used was

they did not use concrete cement or gypsum in  
ys.  
you tell us anything as to the use of marble dust in  
No, I have no technical knowledge of that at all.

*Earl of Carlisle.*

you had experience of buildings that have been  
d with wall-painting?—Yes.  
frescoes in this building seem to have suffered  
and their deterioration has been attributed to faults  
laster or in the wall. I believe, in fact, we have it  
nce that it is usual at present in decorating public  
s to follow the French precedent of marouflage, and  
ne painting on an independent surface upon a pre-  
anel. Should you advocate that?—I think that would  
much safer, because if it is put upon the actual wall  
at is such a very slow drying process. I do not sup-  
wall really perceptibly dries through perhaps under  
sixty years, and there is always a certain amount of  
e coming out. For instance, they have had inter-  
e troubles at the Stock Exchange. They lined the  
f the hall in the centre under the great dome with  
ocks of marble, and there are a number of corridors  
atories and other things on the other side, and those  
vered with glazed tiles, and they were always  
why the polish went off the marble so constantly.  
ad it polished again and again, but it would not last  
an a few months. The reason was simply that there  
s damp shut up in the walls that kept, as they call  
ting through the marble and taking the polish off  
That damp must come out—you must get it out  
w or other—and when it was hermetically sealed  
e tiles it began to come through the marble. Those  
troubles that you have to contend with.

nk we have heard that as regards the panels in the  
Exchange there is an interval in between?—Yes,  
an air space. That, of course, is not what we call  
monumental. Some of those are painted on canvas I  
or most of them.

nk they are on canvas applied to the panel?—Yes,  
is simply an oil-painting.

s not in oil, I think?—No, it is not in oil, it is in  
a.

ey are painted in some mixture that has been  
ly described, but the canvas is applied to the  
—Yes.

nk that is the process that is employed in France, is  
—Yes.

*Earl of Plymouth.*

m afraid I came into the room rather late, but I  
ed when I came in you were suggesting the possi-  
of increasing the height and getting more accommo-  
by increasing the height of the building?—Yes.  
as that with the view first of all of getting rid of these  
ment bars and ugly accessories of that sort?—I think  
generally with the view of getting more accommoda-  
round. Those ugly accessories would be the things  
one would like to see go first. Then, of course, there  
be room for whole departments of people engaged in  
work, of whom I presume there must be a large  
er here.

*Chairman.*

t primarily it was in order to get rid of those vulgar  
ories?—Yes, primarily I think it was.

*Earl of Plymouth.*

haps you are aware that in Sir Charles Barry's  
al design it was intended to have built along the face  
idge Street from the clock tower westward?—  
so.

nk the whole of Palace Yard was to have been  
ed, but I am not quite sure?—Yes.

*Chairman.*

nk the whole of Palace Yard was to be enclosed  
huge gate askew?—Yes; of course that was abandoned  
years ago.

*Earl of Plymouth.*

s, but do you think it would be a mistake to revive  
ea in considering any additions to accommodation?—  
; certainly not. It would be very costly, of course.  
ld be infinitely more costly than my modest sugges-  
an extra storey, and then it has the disadvantage  
gives you the accommodation all up at one end. It  
help the House of Commons end very materially—it  
give them a lot more room there, but I do not know  
would help you at all at this end. That, however, is

of course a perfectly open question. The wall of the clock  
tower remained a rough brick wall for many, many years  
facing the place where, I understand, you suggest there  
might be building. Then when that plan was finally  
abandoned it was faced up with architectural treatment.  
That is a long time ago—I should think getting on for forty  
years.

*Chairman.*

I think it was longer ago than that. I think the plan was  
finally abandoned about 1860?—That is forty-seven years  
ago. Perhaps the wall was not covered immediately after  
that.

*Earl of Plymouth.*

That is a question which really affects the whole large  
question of the accommodation in the Palace; it is not quite  
germane to the present inquiry?—Yes.

As regards Westminster Hall, I think you suggested  
that the statues there should be backed with something. It  
is also a question, is it not, whether the statues should be  
there at all?—Yes, I do not think they help the place much.

You would not suggest covering the stonework of West-  
minster Hall except for the purpose of a background?—Oh,  
no. But it was suggested that the statues might be toned.

*Earl of Carlisle.*

That was the question I put to you?—Yes, that was the  
suggestion. Of course, to use a dead white statue against  
that background is most inharmonious; to my mind it is  
unpleasant.

*Earl of Plymouth.*

And the same may be said of the statues in St. Stephen's  
Hall?—Certainly.

I should like to ask you a general question in order to  
make quite clear what I did not quite understand. In view  
of obtaining simplicity as far as possible in the interior of  
the building, is it, in your opinion, desirable that the spaces  
now left in the corridors and halls within the moulded  
stonework should be decorated with painting or in any  
other way?—Taking St. Stephen's Hall, that certainly is a  
very attractive place in many respects, and I do not know  
whether anything could be done with that—it is very well  
lighted.

From both ends?—Yes; I do not know whether any-  
thing could be done with the spaces there, but I feel very  
strongly that we have hardly got a school which would be  
capable of doing that kind of work sufficiently well at  
present. We shall have it, of course, in time—it is growing,  
and growing fast, but whether we shall ever arrive at that  
or not remains to be seen.

*Chairman.*

But would you leave all the panels in the Victoria  
Gallery as they are now?—We should hope for that happy  
time when we could command artists enough to do it well.  
I do not think they are satisfactory—many of them—at  
present, and I do not think the Royal Exchange, which is  
our last effort, is very satisfactory. Many of the pictures  
there are very good indeed—excellent; but my complaint is  
that they do not go with the architecture, whereas the  
old Italian frescoes went with the architecture to perfection.  
One felt it was in that case all one thing, whereas you now  
feel that these pictures are mere pictures dragged in by the  
head and shoulders, so to speak—at least that is the way it  
affects me, but I dare say I am wrong.

*Earl of Carlisle.*

In the Royal Gallery, where the Maclise pictures are,  
there are now a number of vacant spaces which are at  
present, at any rate, filled up in a way which seems to me  
to damage the existing pictures very much?—Yes, and the  
wall-paper is a very large, strong pattern.

You would see no objection to completing that gallery,  
would you?—If you could get anybody to do it. My feeling,  
of course, is this: in Paris, in the New Sorbonne for  
instance, there is a long picture by M. Puvis de Chavannes  
in the big hall which seems to go splendidly with the archi-  
tecture and with everything else. Then on both staircases  
there are a whole series of pictures which are nearly of the  
size of the panels in this room, which are painted in a very  
full-blooded style, with lots of action and lots of colour and  
paint, and they do not seem to me to go with the archi-  
tecture a bit. The general aspect in the one case is  
exceedingly restful and satisfactory and pleasant, and in  
the other case it is turbulent and, to my mind, dis-  
agreeable.

Does not your answer amount to this: not that wall-  
pictures or frescoes are undesirable in themselves, but that the  
painter should be properly selected?—Entirely:

And that he should have a proper feeling for architecture and should work in subordination to the architectural design?—Entirely. To refer to another place in Paris, at the Panthéon there are pictures by Puvis de Chavannes that seem to fit the place and go right well with their surroundings, and there are other pictures which may possibly be finer pictures for aught that I can tell, but which do not fit in with the architecture a bit—the two clash terribly and deplorably; you wish that one or the other was away—either that the picture was away or the architecture.

*Chairman.*

In short, one may sum it up very shortly in this way—that in decoration painting may be of very great use, but the painting must always be subordinate to the architecture?—Entirely, it must go with it.

The painter must be content to follow the architect?—To be in harmony with the framework.

I should like to refer for one moment to your suggestion of an upper storey?—I am afraid it was perhaps a rash suggestion on my part.

I was going to say that at the present moment it was a somewhat vague suggestion. I do not know whether you could give us a little more detail, not now, but in a letter to the clerk of the committee, perhaps, giving us a little more idea as to how it could be applied?—Yes.

Because I see two different lines of thought about it. You were rather inclined in the first instance to recommend a higher erection here on the front?—Yes.

My own feeling would rather be in favour of dealing with the interior courts, and I should be very glad, if you did not mind, if you would give us a good sound architectural opinion upon that point?—I candidly confess that I think that would be infinitely safer. To tackle the outside building and put a roof upon it would be a very daring proceeding.

I should not like to be responsible for that.—I am not sure that I should myself.

When you are making that suggestion to us in your letter, would you kindly bear in mind that what we are concerned with on this committee is not the enlargement of the House or the question of accommodation in the Palace generally, but the question of decoration, and therefore the point that we specially want to consider is any addition that may be required to get rid of these unsightly excrescences and vulgar necessities that exist now, and therefore we should want to see how we could provide for them?—Yes, I quite understand. It is a very practical question indeed.

*Earl of Plymouth.*

May I put one more question about St. Stephen's Hall? Would it in your opinion be better to treat St. Stephen's Hall in stone throughout, and do away with the panels that are now covered with plain green paper?—Yes, I think so decidedly; that is all leaning towards my attempt at simplifying and restfulness. If those panels were obliterated altogether, the whole of the lower portion would be much more restful and quieter and simpler, and it would give a base to the architecture. I think your idea is a very happy one.

The colour in the building, as is the case in most Gothic buildings, is it not, is found in the stained-glass windows?—Yes, certainly.

The stonework is, generally speaking, in the later Gothic work, uncoloured, is it not?—In the later Gothic work they covered the whole thing with colour from floor to ceiling.

May I ask what date you are referring to?—Fifteenth-century work. I think they painted everything then with colour. It is a puzzle to us, but there is not the slightest doubt; there are traces of colour over all that Gothic period, and there is every reason to believe that it was painted entirely.

*Chairman.*

St. Stephen's Chapel itself was highly coloured?—Yes. We have tried it, but seldom with success. The French have tried it very extensively, and it is hideous and dreadful. It was so at Salisbury. At Salisbury the chapter-house is fully coloured. They found on the top of the capital little pieces of colour like pennies that had dropped down and made a little pool at the top of the capital. It was brilliant vermilion and bright blue, but when we try to treat it with brilliant vermilion and bright blue the result is not very satisfactory. I think his Lordship's suggestion of doing away with the panels is a very happy one.

Then you would have no pictures at all?—No at all. You would have a fine base to a great windows and you would have more plain wall, what I hanker for.

You would have plain wall without arched wall without arcading.

*Earl of Carlisle.*

I do not want to controvert what you have said nor rather inconsistent with what you recommended in the minster Hall when you said that the long stone stonework rather unsatisfactory and you would recommend material to be put up or stonework?—That was background for the statues.

But there are statues in St. Stephen's Hall as well. Yes, but do you not feel that a great deal might be gained by toning those statues so as to reduce that extreme white which is what I dislike very much?

Then would you give up hope of ever having windows?—No, you could revert to it in a future century.

*Earl of Plymouth.*

My question only referred to St. Stephen's Hall, and not refer to the Royal Gallery in the slightest degree. Quite so.

St. Stephen's Hall having these large Gothic windows on either side with colour in them, with comparative spaces underneath now filled with green paper?—Of course St. Stephen's Hall is after all somewhat of a nature of an entrance hall, and you do not need it much decorated. Just as in a private house you need your outer entrance hall to be decorated in the same way as your rooms, you look upon it as an ante-chamber what is coming, and that is rather the way I feel with respect to St. Stephen's Hall.

*Chairman.*

Have you seen in the Lobby of the House of Commons and in some of the passages round the House of Commons how they have cleared off the paint?—I have not seen it.

If you had seen it, I was going to ask you whether you would recommend the extension of that to the other building?—It sounds right, but I have not seen it.

Do you know at all why the paint was originally on the stone there?—I should expect it was because of the weather to get very dirty.

But will not that apply to what is done now?—Yes, it may.

I think they have got some method of enabling the stone to be cleaned now, have they not?—Yes, of keeping it clean.

You merely give that as your general impression?—Yes, stonework, not from any particular knowledge of what has been done here?—We know from experience stone work is very troublesome things to keep clean; the pieces are very troublesome things to keep clean; they are dirty towards the edging and mouldings. It may be the fault of the housemaid. I do not know as to whether they are certainly troublesome to keep clean, but painting gets over that difficulty at once; it is quite easy to keep it clean.

*Earl of Carlisle.*

I have asked you already your general opinion as to the value of the building. I gather that you quite value it apart from any expensive scheme of decoration the effect of it is largely improved by these decorative treatments which have been described?—I propose so, but of course I have not seen the room which the noble Lord has spoken. I should like to see it.

*Chairman.*

Then perhaps you would let us have a letter giving a little more definitely your idea as to how any improvement in accommodation might be given by increasing the height?—Yes.

*Earl of Carlisle.*

Perhaps if you are doing that you might at the same time express an opinion as to the probable and comparative advantage of extending the building, as it was proposed, under the clock tower?—Yes; of course there is a difficulty about that is that the extension would be built out at the extreme corner of the building. It might be useful in a variety of ways.

*Chairman.*

It would be very useful to the House of Commons. Yes.

*Earl of Carlisle.*

Would there be any reason to prevent its coming over the archway to the committee-room here in the

ace Yard in this way (describing it on the plan)?—Not slightest that I can see.

The letter which Mr. Norman Shaw wrote has not been stated in full. But when the First Commissioner of Works giving evidence the chairman, Lord Stanmore, referred to it, saying:—"I have received a letter from Mr. Norman Shaw. He says:—"My Lords,—In accordance with your request, I have made a general examination of the Palace of Westminster to see what could be done in the way of structural alterations. First, to remove some unsightly recesses, such as refreshment bars and telephone boxes; and, second, how additional accommodation might be obtained at a moderate cost for departments which at present are inadequately housed." That is not any part of the business; we did not give him any instructions really to that. "There are many positions in which the telephone boxes might easily be placed as thus: passing from the square hall (I am not sure of its name, but it is on the floor below the hall where the frescoes are) into the main corridors, right and left, there are two compartments or alcoves, in each of which might be placed a telephone box, as shown on the accompanying plan. The wall might be raised a little, and the boxes sunk in it. They would be easily visible, as every one would see them in passing. They would not be in the way of the traffic, and they might easily be made quite presentable. A telephone box is about 2 feet 9 inches wide by 3 feet deep. In many places the walls are 3 feet 6 inches thick; in other parts 2 feet 6 inches. In the former the box might be recessed entirely in the wall, and in the latter nearly so, so as practically be unobjectionable; and the small space to be cut out, less than 3 feet wide and about the height of an ordinary door, would in no way weaken the wall. The refreshment bars would be somewhat more difficult, as to get them well placed it would be necessary to build up the wall. At present there is one on the large square hall (where the remains of the frescoes are). I would propose to build a small addition over the rooms below, looking into the Commons Inner Court. This room would be best if approached from the square hall, by removing the existing fireplace which is never used, and making a doorway in its place. If the removal of this fireplace is considered unadvisable, the room might be entered from the corridor, but entering from the hall would be more direct and better seen."

The First Commissioner remarked:—"If I may say so, I think Mr. Norman Shaw has not quite appreciated the present state of that hall, either as to its present structure or the necessary arrangements or rearrangements which would have to be made. I should say first of all that his sketch plan does not represent the existing state of affairs. The doorway in the centre is now occupied by an essential serving-room for the House of Commons dining-rooms. The recesses which he suggests for telephone boxes no longer exist, but are both of them doorways leading from the House of Commons corridors to the House of Commons smoking-room and the additional dining-rooms. The fireplace in that hall is behind the bar which is considered essential for strangers, witnesses and counsel attending the committee-rooms upstairs. The telephone boxes were placed upstairs, I understand, for the use of the counsel, solicitors and Parliamentary agents. If they could be placed where Mr. Norman Shaw suggests, they would be a part of the House of Commons building where no stranger can go."

Afterwards the chairman again referred to the letter:—"Another paragraph of Mr. Norman Shaw's letter presents to me an extraordinary new idea. "In going over the building I was amazed to see the number of places in which increased accommodation might be gained without any visible alteration to the building from the ordinary points of view. It would be easy to get some fifty or sixty additional rooms at a very moderate cost—probably far more."

The First Commissioner of Works observed:—"That is a very interesting statement, both as to the number of rooms and as to the moderation of the cost. I think if Mr. Norman Shaw knew what our structural alterations in this Gothic building cost when I have to make quite small ones he would perhaps omit the adjective in that sentence."

## UNIVERSITY COLLEGE, LONDON.

THE Calendar for the Session 1907-8 has been issued. It contains many new features. There is a sketch of the history of University College by Dr. Carey Foster, together with a full statement of the statutes and regulations under which the college is now governed in its new position as an integral portion of the University of London. It also contains a set of plans that show the uses to which the extension buildings are being put. It appears that the space now available for university purposes is greater by one-third than it was last session. Interesting features are the various examination papers, of which the following will serve as examples:—

### ARCHITECTURE.

#### I. QUANTITY SURVEYING (Upper Grade). Evening Class.

[No student is expected to answer the whole of the questions set, but every student must answer the first three questions marked with an asterisk. Answers should be numbered to correspond with the questions.]

Note.—Mitchell's Plates Nos. 38, 39 and 40 to be used.

- \*1. Take off the carcass work and roof of drawing-room bay, assuming it to have a lead-covered roof.
- \*2. Take off the finishings to windows of dining-room bay in deal, including painting.
- \*3. Abstract and bill the work contained in answers to two foregoing questions.
4. Describe how variations on contract should be dealt with.

5. Explain the method of dealing with "provisions," and write a specimen "provision" bill.

6. Take off the tiling to roofs as shown on plate 39.

7. Explain the method of taking off faience work for separate tradesman, and describe what attendance would be required to be furnished by the general contractor.

8. Take off the drainage as shown on plate 39.

#### II. QUANTITY SURVEYING (Lower Grade). Evening Class.

[No student is expected to answer the whole of the questions set, but every student must answer the first three questions marked with an asterisk. Answers should be numbered to correspond with the questions.]

Note.—Mitchell's Plates Nos. 38, 39 and 40 to be used.

\*1. Take off brickwork to basement as plan plate 39 and sections plate 40.

\*2. Take off the carpentry and boarded floor of drawing-room plate 39.

\*3. Abstract and bill the work contained in answers to two foregoing questions.

4. Give the order of a bill of quantities and write out a summary.

5. Describe how you would take out the carcass of a building, giving a list of the principal sections of the work.

6. Explain the meaning of the term "provisional" and how it is applied in preparing a bill of quantities.

7. Give the meaning of the following terms:—Skew, squint, obtuse birdsmouth, console, cantilever, truss, entertie, brace, sprocket, cleat, puncheon, stud, quarter, ashlar, wreath, ramp, arris, reveal, flush, matched, chamfer, staff bead, quirk.

8. Take off finishings in deal to a doorway 3 feet by 7 feet in one-brick wall, plastered both sides with linings and moulded architraves.

EDMUND J. BURR, *Instructor.*

F. M. SIMPSON, *Professor.*

### BUILDING CONSTRUCTION.

#### I. FIRST YEAR.

1. Draw to inch scale the plans of heading and stretching courses of one side of a window opening in a 14-inch wall. Allow for a recess  $4\frac{1}{2}$  inches in depth on the inside and show a  $4\frac{1}{2}$ -inch reveal on the outside.

2. Name and sketch in elevation any kinds of stone-walling you may know.

3. Draw to 8-inch scale a plan, section and elevation of a first-floor fireplace. Make the opening 3 feet in width and omit the boards from the plan in order to show the trimming of the joists and hearth-arch.

4. How are building stones classified? State what you know about the following:—Portland, Bath and York.

5. Draw cross-sections one-eighth full-size through the girder and binder of a floor having 12 inch by 6 inch rolled joists, 5 inch by 3 inch R.S. binders, and 7 inch by 2 inch wood joists. The girder and binder are to be cased in plaster and are to show below the general ceiling level.

6. What are the characteristics of good timber? What causes decay in timber and how can it be avoided?

Mr. R. M. Prescott has been recommended for the position of town clerk of Sheffield at a salary of 1,250l. per annum. Mr. Prescott held the same office in Fulham.

7. Draw to quarter-inch scale a section through a roof showing a queen post roof-truss with a span of 30 inches and a pitch of 45 degrees. Sketch a quarter full-size detail of the joint at the head of the queen post and include the purlin and rafter.

8. Sketch the various methods of preparing a roof to receive slates from the simplest to the most elaborate, and give brief descriptions and comparisons.

9. How is leadwork fixed in:—(a) stonework, and (b) brickwork in side-flashings? What are the three chief methods of treating side-flashings in a slated roof?

10. Draw to one-eighth inch scale a skeleton diagram of a steel roof-truss suitable for a span of 30 feet; and draw a quarter full-size detail of any joint.

11. Show by sketches where damp-courses occur. What purpose do they serve and of what materials are they made?

12. Draw full-size sections of the side joints of floor-boards, and show the nailing.

13. Sketch in isometric projection to about half full-size the tenons in the joints in a door between (a) the top rail and style, and (b) the bottom rail and style.

14. Draw full-size the plan of the lining of the jamb of an internal door suitable for a 9-inch brick wall. Show all grounds and fixings.

15. Sketch to about half full-size a plan of the casing of a double-hung sash-window. Name and figure the various parts.

## II. SECOND AND THIRD YEARS.

### Group A.

1. A brick pilaster 2 feet 3 inches wide projects  $4\frac{1}{2}$  inches from an 18-inch wall. Draw to  $\frac{1}{8}$  inch scale plans of two courses of pilaster and wall immediately adjoining, and in elevation four courses to the same scale.

2. Draw to inch scale the elevation of a flat red brick arch for a window opening 4 feet wide, and show top courses of red brick quoins.

3. State the advantages and disadvantages (if any) of Portland stone over Bath stone.

4. Illustrate by sketches the slating and tiling of roofs, and figure the size, lap and gauge.

5. Describe and, where possible, illustrate by sketches, the different precautions which should be taken to prevent damp entering a country house on a clay soil.

### Group B.

6. Specify the different woods that can be used for (a) floors, (b) sash-windows, (c) internal doors.

7. Describe any two substitutes which can be used for a wood partition, and their advantages and disadvantages.

8. Illustrate by sketches the construction of the different parts of a wood newel staircase.

\*9. Sketch in outline the plan of any building with which you are acquainted, showing the position of its sanitary fittings, and draw a scheme of drainage for the same. Figure sizes of pipe, describe traps and scheme for ventilating the drains. Rain-water not to be considered.

10. Describe one or more methods of dealing with rain-water from the roof of a country house.

11. The ground floor of a house 25 feet frontage between party-walls is to be removed to make a shop-front. From basement to ground floor is 9 feet high, from ground floor to first floor 13, from first floor to second floor 11. The first floor has three windows in front, each 4 feet wide. Draw to  $\frac{1}{4}$  inch scale elevations, front and side, of needle shoring for the same, and show strutting of first-floor windows. Nothing to be shown above second-floor line.

### Group C.

12. Draw to one-eighth inch scale a skeleton diagram of a steel roof-truss of the trussed rafter type suitable for a span of 30 feet; and draw quarter full-size details of any joint with (a) circular rods and (b) flat bars for the tie or tension rods.

13. Briefly describe the principal materials employed in fire-resisting construction, with special reference to their fire-resisting properties in (a) floors, (b) roofs, (c) partitions and (d) stairs.

14. Sketch in isometric projection, to about half-inch scale, a cross-section through any two fire-resisting floors, showing half a bay on either side of a main girder of 30 feet span; and write a brief description of each system.

15. Describe with sketches the construction of (a) stone and (b) concrete stairs for narrow and wide widths.

16. What is the safe bearing load for ordinarily good soils? How would you calculate the area of foundations on

such a soil in order that it may be capable of resisting pressure from above? Describe several ways of distributing the load from a stanchion over the soil.

## HISTORY OF ARCHITECTURAL DEVELOPMENT

### I. FIRST YEAR.

1. Draw in elevation to a scale of  $\frac{1}{2}$  inch equals 1 foot module the angle column and the one next to it of the Parthenon, Athens, with the stylobate under and entablature over. Draw the section of the entablature four times the size.

2. Describe and illustrate by sketches the development of the Greek temple plan.

3. Name some buildings of the Greek Doric order in Greece or its colonies, and mention the peculiarities of more than three.

4. Describe the construction of the entablature of a Greek Doric temple and illustrate by sketches.

5. Mention the materials used by the Greeks, and describe the methods of building followed by them in stone and marble.

6. Name the precautions taken by the Greeks to counteract optical illusions.

7. Name the countries in which the lintel was used in ancient work.

8. Describe the methods of building arches and vaults prior to our era, and state in which countries each was followed. Illustrate the methods by sketches.

## II. SECOND AND THIRD YEARS.

### Group A.

1. Describe and illustrate by sketches the substitution of arches and piers in Mediæval work, and state reasons for it.

2. Illustrate by sketches the development of moulded (not carved) capitals between the twelfth and fifteenth centuries (both inclusive) in England.

3. What are the main differences in construction between Roman intersecting vaults and Mediæval vaults of the thirteenth century? and describe the steps by which fan-vaulting was evolved in England.

4. Illustrate by sketches the development of window tracery in England.

5. State the main differences between English and Norman French cathedrals:—(a) plan, (b) proportions, dimensions and the results of these differences.

6. Describe briefly the west fronts of Laon, Paris, Bourges cathedrals, and compare them with the west fronts of Salisbury, Wells and Exeter cathedrals.

7. In what respects do the cathedrals of Southern France differ from those of the North?

### Group B.

8. Describe the principal characteristics of the basilica church in Italy, and state in what particulars provincial examples differ from those of Rome.

9. Compare and contrast the domes of (a) the Pantheon, Rome, (b) St. Peter's, Rome, (c) St. Paul's, London, and illustrate by sketches of their sections.

10. To what extent do typical Italian churches of the Renaissance (St. Andrea, Mantua, St. Peter's, Rome, etc.) follow the plan of ancient Roman buildings, such as the Basilica of Constantine, &c.?

11. Describe the main characteristics of domestic architecture in Florence, and state in what important respects Florentine domestic work differs from Venetian.

12. Compare and contrast the Rucellai Palace, Florence, the Cancelleria, Rome, and Palladio's houses in Vicenza.

13. Write a short account of the commencement of the Renaissance in England (1520-80).

14. Illustrate by sketches typical plans of Elizabethan country houses, and compare them with eighteenth-century country houses in England.

**The Chancellor** of the diocese of Carlisle has declined to grant a faculty to assign two pews in the parish church of Hesket-in-the-Forest to Charles Ashton James, of Barrow Park, and his family, and others, the occupiers for the time being of Barrock Park mansion-house, or any house on the site thereof, exclusive of all others for ever. All the pews in the parish church, he said, are the common property of the parish. The distribution of seats rests with the churchwardens as the officers, and subject to the control of the ordinary.

# CROSBY HALL.

A meeting summoned by the Lord Mayor to consider the subject of the preservation of Crosby Hall was held in the Mansion House on Tuesday.

Mr. Vezev Strong, who presided, said that the cost of the work which would have to be acquired in order to be arranged with the directors of the Chartered Bank would be about 50,000*l.*, and the purchase of leasehold interests estimated at 60,000*l.* It was proposed to raise the money partly on mortgage, and partly by contributions from City Companies and the public.

Mr. W. D. Caroe said the building was to the student of architecture what a Reynolds or a Gainsborough was to a painter. The hall was not affected by the later works.

Mr. William Dunn explained the financial condition of the property, and said if Michael Angelo Taylor's Act were passed a reduction of the cost of the leasehold interests would follow.

A resolution was passed approving of the proposals, and a provisional committee was appointed to confer with the persons interested.

Messrs. Gordon & Gunton, the architects for the new building, have prepared the following report:—

Finsbury House, Blomfield Street, London :

September 25, 1907.

Re Crosby Hall.

Dear Sir,—As instructed by your Board, we have pleasure in reporting to you as to the work connected with the demolition at the above, and in sending particulars of various items of interest so far discovered.

As you are aware, the work of pulling down the old building has been entrusted to a first-class firm of building contractors, Messrs. Trollope & Colls, rather than employ an ordinary housebreaking contractor, and that instructions have been given that the work should be done with the utmost care with a view to the preservation of any part of the building that may be interesting from an antiquarian point of view. For this purpose a foreman is constantly employed upon the work during the day and a watchman at night.

Your instructions to us to pull down only that portion of the building fronting Bishopsgate Street, known as the Council Chamber and so-called Throne Room, leaving the quieting-hall and its appurtenances intact, have been embodied in an agreement and are being duly carried out.

At the present time the portion of the building fronting Bishopsgate Street has been pulled down to the ground-level, and by the 30th of this month will be completely reduced to the basement level.

So far as that portion of the building now being pulled down, we have to report that hardly any old work has been found other than the walls and rough timbering, the following only being of any interest:—Two stone chimney-pieces of the Tudor period, some of the old masonry connected with two of the windows, and to the north door of the old postern gate. There are two panels of Roman tessellated pavement, discovered by Sir Francis Davies some years since under that portion of the Council Chamber lately occupied by the offices. These panels were framed and tabulated by him and fixed to the wall of the staircase, and were removed by him prior to the pulling-down of the building, and are now in his charge at No. 23 Great St. Helens. So far as the gabled front in Bishopsgate Street is concerned, this was found to be modern, although keeping with the old lines and appearance, the windows being deal and the architraves plaster, and the pinnacles, which were apparently carved, were found to be cast-iron; the barge-boards also deal, grained to imitate old work. This building appears to have been stripped and utterly spoilt many years since, practically everything of value having been removed.

With regard to the banqueting-hall, as you are aware, the contract for pulling this portion down has been entered into, but the understanding was that, unless instructions to the contrary were given, this work of demolition should be proceeded with immediately after the 30th of this month.

The expense attached to the careful removal of this part of the building must be very considerable. There are many most interesting details well worth preserving. So far as we have been able to judge, the great part of the roof with its stone corbels supporting the same appears to belong to the original period, and is well worth preserving. Theiel window is a very beautiful specimen of fifteenth-century work, and it is worth while going to the expense of taking this down in bulk. Several of the other windows of the same period and in a fair state of preservation,

and the chimney-piece may be partly old, but portions of these works have been spoilt by alterations carried out in plaster. Scarcely any portion of the gallery fronts appears to be antique; it is framed in deal and grained to imitate oak. None of the original woodwork, except portions of the roof, has been preserved. Very little of the glazing is antique; it is mostly heraldic, and probably placed in the windows to commemorate the subscribers to the alterations which took place something like seventy years since.

The general design and appearance of the hall has been maintained to a certain extent, and the general effect is good, but the work is to a great extent imitation and formed with inferior material.

We would suggest that the authorities at South Kensington and at the City Guildhall might be communicated with, with the view of the interesting parts being preserved.

As we have before stated, we have given implicit directions to the contractors that, in the event of the building being entirely removed, all articles of interest shall be reserved, and we have had photographs taken of every portion of the building as a record, and a complete survey of the old buildings has been made and planned by us.—We are, dear Sir, yours faithfully,

GORDON & GUNTON.

William Hoggan, Esq., the Chartered Bank of India, Australia and China, Hatton Court, Threadneedle Street, E.C.

## MILIZIA'S PRINCIPLES OF ARCHITECTURE.

ARCHITECTURE, like every other fine art, is subject to the following general rules:—(1) In all its productions we should find an agreeable correspondence of the parts with the whole. This is known by the name of symmetry. (2) It ought to have variety lest the spectator's attention should be wearied, and unity, which is opposed to confusion and disorder. This is comprehended in the term eurhythmia. (3) Convenience, or suitableness, is also a necessary quality. This consists in a just application of symmetry and eurhythmia, and of that relation which ought to subsist between an edifice and the purpose to which it is applied; between the details of ornament and the general appearance of the building, choosing the most appropriate, and the style which accords best with the magnificence or simplicity of the structure. (4) If architecture be the daughter of necessity, every beauty which it possesses ought to connect itself with that necessity, and to appear made for some useful purpose. In every art which administers to pleasure the artifice ought not to be discovered; everything done for mere ornament is a defect. (5) The principal ornaments of architecture are its orders, which in fact are rather to be considered as the skeleton and most essential part of the edifice than as mere ornament. We might therefore define the orders, necessary ornaments arising from the nature of the edifice. All the other decorations of architecture are subject to the same law. (6) Consequently, in architecture the decoration is the result of the construction. Nothing is ever to be seen in a fabric that has not its appropriate use and is not an essential part of the structure; the office that it indicates it ought to perform. (7) Consequently, nothing is admissible for which a good reason cannot be rendered. (8) These reasons are to be deduced from the origin and analysis of that primitive natural architecture, the hut, from whence has arisen the beautiful imitative art of civil architecture. This is the pole-star of the artist in his works and of the intelligent observer in examining them. Everything should rest upon truth and verisimilitude. What could not really exist cannot be approved, although evidently a matter of mereshow. (9) Examples and authority, however they may be appealed to, will never influence him who wishes to be reasonable. These principles are constant, positive, general, because they depend on the nature of the thing itself and on good sense. Taken together, they constitute the true and essential beauty of architecture; if they are kept out of view, adieu architecture. It is no more a science or an art, but is changed into mere fashion, caprice, or delirium.

The "Principii di Architettura Civile," in three octavo volumes, contains the same view of the subject, carried out into all its bearings, as that sketched in the preface to the "Memorie degli Architetti." In spite of the apparently limited nature of the subject, Milizia has made great part interesting and even amusing. Like Vitruvius, he is fond of introducing a little natural history, and he is hardly more correct or more to the purpose than his Latin original.

Of the "Arte di Vedere" a few words may be said. Milizia had probably been disgusted by the extravagant praises so lavishly bestowed on Michel Angelo and echoed from one writer to another, and in this book he sees nothing but his defects. No wonder, then, that it offended the "stupid adorers of Buonarroti," and the sensible ones too. On this and several other occasions Milizia gives to Mengs a degree of praise which the present age disclaims. In the "Roma delle belle Arti" praise and blame are more mixed. The offence seems to have been taken from the force and spirit of the remarks rather than their direction; he may sometimes exaggerate, but he rarely blames on grounds either insufficient or mistaken. The "Dictionary" is by no means a mere compilation; Milizia could not write without criticising, and no man was less disposed to adopt implicitly the observations and sentiments of another. He has in these works frequently repeated himself, but they all contain much original matter.

#### NORTHERN ARCHITECTURAL ASSOCIATION.

A MEETING of the Northern Architectural Association was held at Wallsend on Saturday. The party, numbering upwards of forty members, travelled by special car from the rooms of the Association at Higham Place. An inspection of the Western Council schools was made under the guidance of Mr. W. H. Knowles, architect, and the party afterwards proceeded to St. Luke's Church, where they were received by the vicar (the Rev. W. M. O'Brady Jones). Mr. Weightman (on behalf of the architects, Messrs. Oliver, Leeson & Wood) explained the recent additions to the church, and the members were hospitably entertained at the vicarage at the conclusion of the meeting. Among those present were Mr. A. B. Plummer (president), Messrs. H. C. Charlewood, W. H. Knowles, J. Bruce, G. T. Brown (Sunderland), J. M. Dingle (South Shields), W. J. Moscrop (Darlington) and C. S. Errington (hon. secretary).

#### GENERAL.

The Hendon Education Committee have considered plans for a new school at the Hyde to accommodate 1,000 children, and awarded first place in the limited competition to Mr. W. G. Wilson, F.R.I.B.A., 5 Bloomsbury Mansions, W.C. The second premium was awarded to Mr. G. Hornblower, F.R.I.B.A., of Devonshire Place, W., and Hendon, and the third premium to Messrs. Cabuche & Hayward, M.M.S.A., Westcliff-on-Sea and Finchley.

Mr. G. H. Wenyon, architect, Tipton, has been successful in a competition for a Carnegie library at Dudley. The plans placed second and third were by Mr. John P. Osborne and Messrs. Nichols & Nichols (both of Birmingham) respectively. The competition was limited to architects practising within a radius of 50 miles from Dudley.

In Connection with the courses of lectures and practical work for the architectural students arranged to be held at University College in the evenings in conjunction with the Carpenters' Company, a public introductory lecture on "English Mediaeval Architecture" will be delivered by Mr. Edward S. Prior, F.S.A., F.R.I.B.A., in the Botanical Theatre, University College, on Friday, October 11, at 6.30 p.m. Lieut.-Col. A. C. Preston (master of the Carpenters' Company) will preside.

The Bury St. Edmunds pageant committee report that the total receipts of the recent pageant amounted to 10,084*l.*, of which 7,873*l.* was from the sale of tickets. After paying expenses and returning all subscriptions, a balance of just over 1,000*l.* remains. To what purpose the surplus is to be devoted has not yet been decided.

The Prix Chaudesaigues was awarded on Saturday by the French Academy of Fine Arts to M. Levard, architect. The subject assigned was the publishing office of a large newspaper.

Pictures by the following artists in the Barcelona International Exhibition have been purchased by the executive commission for the Art Museum of Barcelona:—W. Lee Hankey, one water-colour and one colour-print; R. Anning Bell, one water-colour; Bertram Priestman, one oil-colour; Professor Gerald Moira, one oil-colour; Alfred Withers, one oil-colour.

M. Paul Chevalier, who was one of the principal auctioneers for works of art in Paris, died on Sunday in his fifty-sixth year.

A Course of six lectures on William Blake will be given at Alexandra College, Dublin, beginning on Monday, October 7, at 8 p.m., by Mr. J. H. Wicksteed.

The Hon. John Collier is exhibiting his picture "J. Godiva" at the Modern Gallery, 61 New Bond Street, for a few weeks.

The Governors of the Glasgow School of Art held their annual meeting last week. Sir James Fleming was elected as chairman. The report stated that there had been increases both in the number of students enrolled and in the amount of fees received, and in face of the advance in the standard now required for admission that was considered very satisfactory. An important recognition of the school by the Glasgow provincial committee had taken place, and it was now a centre for the training of art teachers, a course of instruction not hitherto attempted in Scotland, but well judged by the demand made for art teachers, was necessary. Senior classes alone will be held, and to enable deserving students to fulfil the requirements, the Scottish Education Department had authorised the Governors to grant maintenance bursaries. A very favourable report had been received from His Majesty's inspector, Mr. F. W. Young, upon the classes for the instruction of school teachers in drawing, and the other departments of the school were reported upon as being in a very healthy condition.

The Lancaster Town Council, who have been considering the selection of a motto, recently approved of "The Honourable Lancaster," but the Garter King at Arms declined to register it, on the ground that it was a quotation from Shakespeare and applied to John of Gaunt. Thereupon a member of the Council gave notice to rescind the resolution, so that the whole question could be gone into anew. It was announced at the meeting of the Corporation on Wednesday that the Garter King at Arms had fixed upon "Lucy Loyne" as the motto, and had registered it. This led to strong protests by several members, who urged that the Council should adopt its own motto and not be dictated by any outside official. An amendment was proposed that the motto be "May time-honoured Lancaster be ever prosperous," but this was defeated by 14 votes to 7, the assurance being given that whatever the Council proposed would not be registered, and that the one chosen for the town was definitely fixed.

The Restoration of Winchester Cathedral will soon be a standstill if more money is not forthcoming. The end of the structure is safe, but the transepts are dangerous and are shored up. Preservation of these must not be proceeded with until more money is received, and the shoring will remain as a protest. Another appeal must be made. There has been an excess of expenditure of the fund of 5,000*l.*, and in addition 30,000*l.* will be needed.

The General Purposes Committee of the Worcester City Council have approved of the suggestion that the ceiling of the north window of the Shire Hall should be decorated with the arms of the city of Worcester and the arms of the five boroughs within the county. They have resolved that the mayor and chairman of the committee be asked to obtain subscriptions towards the cost of the city arms, viz. 14*l.*

Mr. C. Turton has been appointed surveyor to the Epsom Rural District Council at a salary of 220*l.* a year. There were nearly two hundred applicants, three of whom the Council interviewed, viz. Mr. F. Feather, surveyor to the Cheriton Urban District Council; Mr. J. C. Hooper, surveyor to the Hitchin Rural District Council; and Mr. C. Turton, chief assistant surveyor, Cannock Rural District Council.

The Municipal Buildings Scheme for Coventry was the principal matter before the fortnightly meeting of the City Council last week. In June last the Local Government Board held an inquiry as to the proposal to borrow money to place municipal offices, above shops, in Earl Street. The Department now wrote that it appeared to the Board that at present there was not sufficient evidence as to the probable cost of the buildings, and requesting that detailed drawings and a priced bill of quantities might be prepared and a detailed estimate forwarded. The Board further stated that the estimate should show clearly what amounts were included for adapting the ground floor for shops. In this connection the Board explained that the provision of shops did not appear to them to be a purpose to which the borrowing powers conferred by the Municipal Corporations Act, 1882, were directly applicable. After a discussion it was resolved to ascertain from the Local Government Board whether they would, under any circumstances, sanction the erection of shops underneath municipal buildings, before incurring the expense of supplying information in detail.

# The Architect.

## THE WEEK.

The London Building Act, 1894, there are rules for the conversion of buildings which undoubtedly may be described as flats, although they may be described as separate dwelling-houses. In the majority of cases similar regulations are observed. In fact common sense would dictate that a more exact scrutiny of plans is needed when a house is transformed into a series of flats than in ordinary cases relating to houses. At Hove, however, where it is supposed the most advanced regulations are enforced, flats have come into existence for which no plans were approved by the proper authority. The matter has at length been brought under the notice of the works committee of the Council, and the following resolution was passed:—"That the town clerk and borough surveyor be instructed to take steps to bring under the notice of architects, builders and others concerned, the conversion of a single dwelling-house into several tenements falls within section 159 of the Public Health Act, 1875, and is, therefore, the erection of a new building, and that plans must be submitted under the provisions as to new streets and buildings for the consideration of the Council."

It is proposed to hold an exhibition of British art in the Town Hall during March, April and May of next year. The director is Mr. LAKE, who has been connected with similar exhibitions since 1888. It is intended to have a loan collection of the works of the principal painters of the Victorian era, and paintings, drawings and engravings of various kinds will be shown in the hope of inducing purchasers for them. There is a National Gallery in Melbourne, and as a sum of 6,000*l.* is likely to be available in June the whole or part of it will be offered for the purchase of pictures. Several excellent examples of English art have already found a home in Australia, and few of the Colonies have done more to encourage a love of art among the people. The opportunity is therefore worth the consideration of painters, and it cannot be denied that at the present time an unusually large number of pictures will be found in Australia.

On Wednesday Lord RIBBLESDALE opened the new Art Exhibition in the Whitechapel Art Gallery, which will be continued during October and November 1907. It is another instance of the variety of the Rev. Canon BARNETT and the trustees contribute to secure for the benefit of the people of the city. One gallery is devoted to paintings and drawings. There are groups of paintings by Flemish and Dutch animal painters (RUBENS, SNYDERS, PAUL POTTER, COETER, &c.), as well as groups by the older English painters (MORLAND, STUBBS and WARD), and nineteenth-century or contemporary animal painters from England and France. A second gallery is given up to Japanese and Chinese paintings, drawings and engravings of animals. In the lower gallery there are models for (1) animal sculpture; (2) animals in ancient Assyrian, Egyptian, Greek and Roman; (3) Mediæval carvings and paintings illustrating the animal symbolism of the bestiaries, &c.; (4) heraldic animals; (5) the use of animal forms in decorative work by various races. Animal forms occurring in tiles, tapestries, metalwork (aquamanilles), pottery, furniture, &c., have been included. There is a section for drawings of animals by DÜRER, REMBRANDT, ROMNEY, WARD and modern artists. The subject, "Animals in Art," is one that is certain to appeal to people in East London, and it is hoped that by treating the subject widely and giving some examples of ancient, Mediæval and modern work it may be made both interesting and of educational value.

It is strange how little is known by many sensible people about the organising power necessary when a large contract for any kind of construction is undertaken. Owing to the circumstance that in the early days of railway making some of the contractors were of humble origin, the tradition has been expanded about the competence of navvies to bring difficult works to a successful issue. But among the early railway contractors the most successful were men like THOMAS BRASSEY, who were endowed with extraordinary administrative powers. In our times there is little chance for the navvy unless with very small contracts. If there is one class of work which demands the exercise of constructive power, caution, watchfulness and experience, it is the construction of a reservoir. The catastrophes which may follow from a slight settlement or from a few cubic yards of careless work are too well known to be discussed. Yet when it was proposed last week to give a contract for a new reservoir for Bolton to Messrs. BEST, of Edinburgh, some of the members of the Council insisted that the fitting course was to have the work done by the working men of Bolton under Corporation officials. Any apprehension about the want of experience on the part of officials or workmen was scouted. Fortunately there was a large majority of the Council who were able to take a sensible view of the case, and the Delph reservoir will be carried out by a firm who are acquainted with the risks of that class of work.

On Wednesday evening a water-colour drawing, *On the Test, Hants*, by Mr. AUGUSTUS WALFORD WEEDON, R.I., was presented to the Architectural Association on behalf of old pupils of the water-colour class as an appreciation of friendship, and in pleasant remembrance of many happy meetings. Mr. WEEDON was during fourteen years instructor of the class, and endeared himself by his genial manner to all the members. The drawing was subscribed for as a memorial of his services by the following members:—ERNEST BATES, C. W. BEAUMONT, A. G. BEWES, CECIL C. BREWER, H. C. CORLETTE, L. S. CROSBIE, W. E. DAVIS, ARCH. C. DICKIE, F. R. FARROW, BANISTER F. FLETCHER, H. L. FLORENCE, D. THEODORE FYFE, H. R. GOODERHAM, E. GREENOP, S. K. GREENSLADE, A. TROYTE GRIFFITH, EDGAR A. HAWKINS, A. E. HENDERSON, H. C. R. HIDE, I. HUMPHREY JONES, F. LISHMAN, GEO. G. LYNES, E. W. MARSHALL, FRANCIS E. MASEY, F. O. OERTEL, ANDREW OLIVER, JOHN ORMROD, WILLIAM A. PITE, THOS. E. PRYCE, G. H. FELLOWES PRYNNE, KOTARO SAKURAI, W. K. SHIRLEY, A. DUNBAR SMITH, LEONARD STOKES, J. W. STONHOLD, WM. H. TOWN, R. H. WEYMOUTH, T. C. YATES, and W. B. G. LEWIS, hon. secretary.

The twenty-seventh annual meeting of the Glasgow Institute of Measurers was held on Monday in the Building Trades Exchange. Mr. JOHN BAXTER, president, was in the chair. The report of the Council for the past year was submitted. It stated that the membership stood at seventy-four, besides one honorary member and seven associates. It was reported that the examinations qualifying for membership were held in March last. Two candidates passed in the preliminary examination and two were successful in the final examination, and had been placed on the register of associates. A grant of 2*l.* 2*s.* had again been made to the Technical College for prizes in the classes of building construction. The treasurer's statement showed the funds to amount to 65*l.* 13*s.* 4*d.* The office-bearers for the ensuing year are as follow:—President, Mr. GEORGE B. WALKER; vice-president, Mr. ANTHONY PURDIE; secretary and treasurer, Mr. THOMAS N. HILL, F.S.I., 180 Hope Street; auditors of professional accounts, Messrs. JOHN BAXTER and JOHN S. STEWART; other members of Council, Messrs. ALEXANDER DAVIE, JAMES D. HERBERTSON, JOHN H. ALLAN, JOHN W. FYFE, JAMES SMELLIE, ARCHIBALD B. WATSON and JAMES P. SCOTT.

## LONDON COUNTY COUNCIL.

THE meetings of the County Council were resumed on Tuesday. But it must not be supposed that during the recess the committees were inactive. Tenders were received and considered, reports had to be prepared and administrative duties transacted, although accounts of the proceedings did not regularly come before the public.

In the year which has just commenced economy is expected to prevail. Nevertheless, many things must be done which will be of great importance in the Metropolis, and which cannot be carried out without corresponding expenditure. To architects the most important event is the erection of the new County Hall. All the drawings which will represent the final stage of the competition must be sent in not later than December 30. As the assessors have shown remarkable expedition in dealing with the 1,199 drawings submitted in the preliminary stage it may be assumed that a decision may be arrived at early in 1908, and the Council will have to determine the extent which they will be able to build over.

Probably the decision on the cubical content of buildings will have more general interest. The Building Act committee recognise that the large scale on which modern industries must be carried out is not possible with such a restriction as is imposed by 250,000 and 450,000 cubic feet limitations. It is therefore proposed in the next session to amend the Building Act in order to allow horizontal separation, to remove all restrictions on the Council's power to permit increased cubical capacity for buildings of the warehouse class, and to give the Council discretionary power with regard to openings in party walls, the provision of fire-resisting doors constructed of other materials than iron, and the uniting of buildings. There is no doubt that the manufacturers whose interests the County Council are eager to meet are desirous of constructing buildings in which concrete and steel would be employed. It would be well for the County Council to consider whether, in amending the Building Act, more facilities for that class of construction should not be allowed. As the system has proved its efficiency, care should be taken to avoid suggesting that it is inferior to other methods of construction. Warehouses and manufactories need not present an architectural appearance corresponding with that of a county hall, and consequently it is unreasonable to insist that the building regulations shall be uniform.

The position assigned to economy in the programme of the year must affect the proposals relating to the northern frontage of the Strand. "An association of private individuals known as the Further Strand Improvement Committee," in spite of their reiterated efforts, have not yet succeeded in persuading the Improvements Committee to alter the northern frontage between the churches of St. Mary-le-Strand and St. Clement Danes. It is still maintained that the alteration would involve a loss of 249,400*l.*, and that the enhancement of the view of the Strand being doubtful, so heavy a loss is not justified. It is remarkable that as yet people who would be likely to build on the vacant land have in no way expressed any desire for a change. That may be business tactics; for if the sites can be brought into disrepute the Council would have to accept more moderate prices for them. If the property were an ordinary building estate there is no doubt the recommendations of such people would have great value. The Improvements Committee of the County Council are only following the general practice. They can claim that intending leaseholders are indifferent, and while that state of things continues the efforts of those who are eager to preserve the views of the churches and the Law Courts must be in vain. It is strange, but only one additional offer for land in the new street is now before the Council. Messrs. MARK JUDGE & SONS, for the Nineteenth Century Building Society, offer 800*l.* a year rent for a site adjoining Danes Inn House with a frontage of 25 feet 6 inches. An offer which was accepted

last December for a site in Sardinia Street, for a rent of 2,000*l.* a year was to be paid, and a building erected at a cost of 80,000*l.*, appears to be a fiasco.

There is an indication of a slight change in policy of the Housing of the Working Classes Committee. On the Totterdown Fields estate at Tooting the Council had erected already 697 cottages, and twelve more are in progress. In 1906-7 there was a deficiency of 1,541*l.*, and a similar loss would excite alarm in an ordinary building society. The Council propose, however, to construct within the next three or four years 496 cottages. As an instalment, authority to erect sixty-seven is sought at a cost of 15,350*l.* The cottages to have five rooms and a bath-room, thirty-six to have four rooms and a bath-room, and twenty-eight three rooms and a bath-room. It appears there is little demand for the five-room cottages, owing to the number of villas with five rooms that have been put up near the estate. It is an unwise policy to interfere with ordinary building by speculators, who have provided all round London with houses at a very cheap rate. The County Council committee evidently decided they were justified in providing humble tenants more accommodation than was needed. It is therefore satisfactory to find that they are fully considering the policy to be adopted on the other estates, taking that to mean that the supply of cottages will correspond with the demand for them.

The Improvements Committee recommend work for the year will cost only 82,394*l.* To this may be added 100,000*l.* a contribution to local improvements; during the last nineteen years the average has been 425,675*l.* The most expensive undertaking is a street 60 feet wide from Gray's Inn Road to Pentonville Road, with a frontage of 1,000 feet, at the centre of the Metropolitan Railway at King's Cross. For the various improvements the Council advised to obtain from Parliament exemption from the Lands Clauses Act, in order that when taking portions of gardens, private pavements and strips of open land will not be necessary to purchase houses as well.

The Highways Committee recommend some new lines of tramway. The most expensive is from Norwood to the Crystal Palace, which is estimated at 66,623*l.*, and for which the overhead system of traction will be adopted. Another tramway from the Crystal Palace from Lordship Lane Railway Station is estimated at 49,626*l.* It is proposed to seek from Parliament to employ overhead traction on the line between Hammersmith and Putney, and to connect the line from Hammersmith to Harlesden for the accommodation of the visitors to the Franco-British Exhibition.

The special committee who inquired into the working of the Council's electricity station in connection with the Royal Observatory made certain recommendations regarding the machinery and chimneys. The latter were intended to be 272 feet in height at the time of the inquiry they were not more than 204 feet high. The Highways Committee agree that the height shall not be increased, and the other recommendations are also to be carried out. The Observatory is controlled by the Admiralty, and it will also be necessary to consider the conclusions of the committee, so that it may be considered that for the present the subject is ended.

The Finance Committee have arrived at several conclusions of which the effect can hardly be overestimated. Practically there has been hitherto little control over the finances as a whole. It is proposed of discussing the subject at any time, which means that one or more members of a committee may desire to propose that votes on the capital account should be taken at specified times and early in the year. In other words, there will be an approach to the system adopted by Government, for the Budget will have to be discussed and approved by the whole Council. It will consequently be necessary for each committee to prepare a whole year's estimates in advance. The arrangement will, no doubt, involve more labour on the part of the officials and unless there is provision for

it will be difficult to meet requirements which suddenly arise. But if economy is secured, the on whom the burden of taxation falls will rejoice in change. One of its advantages may be that those who tender for works will be allowed longer to make inquiries.

## GEORGE'S CATHEDRAL, SOUTHWARK.

THE announcement of an intention to complete the tower of St. George's Roman Catholic Cathedral will give satisfaction to all inhabitants of the parish who are desirous of seeing long vistas of the city closed by a prominent structure. WELBY, who designed the building, in a letter to the Rev. Canon, the French archæologist and author of the well-known book on iconography, wrote:—"L'église de St. Georges à Londres vous fera plaisir. Elle a une tour de long. Le clocher aura 317 pieds de haut jusqu'à la croix de la flèche." BENJAMIN, in his *Life of Pugin*, adds, "The base of this tower is only yet built, and according to present appearances there seems little hope of the structure ever being completed according to Pugin's design." Pugin made more than one design for the cathedral, but the one now to be desired, for the sake of architectural unity, whenever the tower is raised to its full height as is planned, his intentions will be respected.

In a historical sense the cathedral is interesting, as it is a revival of "True Principles." The majority of the best works of architecture consists of churches and chapels, and all lovers of the art must hope that the cathedral will be far distant when such buildings will be superseded by CARLYLE'S "Cathedral of Immensity," and that there will be no longer possible, in the words of the poet Mariner—

To walk together to the kirk,  
And all together pray,  
While each to his great Father bends,  
Old men, and babes, and loving friends,  
And youths and maidens gay.

At the beginning of the nineteenth century anyone who visited the Roman Catholic churches of London could not imagine that architecture was not tolerated, or that the evolution of architecture had produced the most magnificent structures. That might be ascribed partly to the influence of the penal laws, partly to ignorance, and partly to poverty. The examples must have been shown to those foreigners who were acquainted with the great cathedrals and churches of the Continent. In 1838, when an endeavour was about to be made to produce a change, has left a description of the Roman Catholic churches then existing:—

There is Moorfields, he wrote, like a theatre, with its galleries and boxes; Warwick Street, a concert-room in the sense of the word—an abomination; Lincoln's Inn, a place grated like a chapel for convicts; the rest dirty, dingy, conventicle-looking buildings, with the exception of John's Wood chapel, which, though infinitely superior to the others, savours far too much of the nineteenth century. With this single exception there is not, in fact, the slightest degree suitable for the sacred purposes which it is destined or which is calculated to impress the mind with the sublimity of true religion. All are intended, on the contrary, to produce the worst effects on the mind, and I can hardly wonder at the insulting levity of the architecture displayed by those Protestants who enter them.

Pugin somehow early fell into the way, which is not uncommon, of running down contemporary architects—who, to his mind, appeared to be "men, for the most part, utterly despicable; who venture to produce noble art for the sole purpose of prostituting it to the degrading of it to their own private interests"—and his works. But his description of the churches is based on old drawings and prints. Cardinal ANSELMI relates that when he was a boy his father, who used to hear a piece of music, brought him to the chapel

in Warwick Street, and, although having a precocious interest in ecclesiastical details, he was unable to recall more than a pulpit, a preacher and a boy with a censor.

It was therefore a courageous attempt to propose the erection of a cathedral of a superior character in one of the poorest districts of London. PUGIN, who had made himself prominent by his writings and drawings, prepared designs of a grandiose building in 1838. Anyone who looked at the views might well imagine that the Ages of Faith had returned and that unlimited funds were to be at the architect's disposal. "The eternal lack of pence which vexeth public men" is especially hard upon enthusiastic architects. Poor PUGIN had to own afterwards that with the exception of his own church at Ramsgate, where he was paymaster as well as architect, he never had a chance of producing a single fine ecclesiastical building. Even that church is still incomplete. "St. George's," he said, "was spoilt by the very instructions laid down by the committee, that it was to hold 3,000 people on the floor at a limited price; in consequence, height, proportion, everything was sacrificed to meet these conditions."

The cathedral of St. George was commenced about 1840. PUGIN was then only twenty-eight, but he must have had enough experience to be aware that unless rich men like Lord SHREWSBURY were willing to contribute liberally the money to build Roman Catholic churches was derived mainly from the pennies of the poor. St. George's covered a large area, and it was impossible that the walls could attain the height which PUGIN sought after as the first essential of Gothic. It had to replace a building erected in 1793 in which it was essential, in order to provide accommodation, to surround the nave with a gallery. It was the necessities of the congregation which were dominant with the bishop and clergy, and they could only expect the realisation of PUGIN'S dreams in a remote age.

What seemed to be unaccountable was that having adequate space and being a stickler for orientation, he should neglect that ancient principle of church planning. It may have been through economy that he also employed for the walls the common brick which so easily becomes stained in a London atmosphere. What was intended to be the principal entrance to the church had to be sacrificed to an organ gallery. A chancel screen which was introduced gave rise to much controversy, and, indeed, there were many features about the building which were objected to by laymen as well as by architects. But none of the critics was more sarcastic than JOHN RUSKIN. He had been annoyed in witnessing the indifference to painting and sculpture of the clergy of Italian churches, and he came to the conclusion that Romanism was not only incapable of producing anything great in art, but could not preserve what had been given to it. The griffins of the cathedral of Verona were made to serve as line-props for a washerwoman. Caricatures for sale were allowed to be fastened on the shafts of St. Mark's, Venice. Altar-pieces were being destroyed by candle-droppings. PUGIN was accepted as the chief representative of Catholic art in England, and was turned into a victim for the misdeeds of centuries in foreign churches. His desire to have ample room for the expression of architectural qualities was treated as if it arose from conceit in the possession of imaginary powers, as in the following extract from "The Stones of Venice":—

Phidias can niche himself in the corner of a pediment, Raphael expatiate within the circumference of a clay platter; but Pugin is inexpressible in less than a cathedral. Let his ineffableness be assured of this, once for all, that no difficulty or restraint ever happened to a man of real power, but his power was the more manifested in the contending with, or conquering it; and that there is no field so small, no cranny so contracted, but that a great spirit can house and manifest itself therein. The thunder that smites the Alps into dust can gather itself into the width of a golden wire. Whatever greatness there was in you, had it been Buonarroti's own, you had room enough for it in a single niche; you might have put the whole power of it

into two feet cube of Caen stone. St. George's was not high enough for want of money? But was it want of money that made you put that blunt, overloaded, laborious ogee door into the side of it? Was it for lack of funds that you sunk the tracery of the parapet in its clumsy zigzags? Was it in parsimony that you buried its paltry pinnacles in that eruption of diseased crockets? Or in pecuniary embarrassment that you set up the belfry fools'-caps with the mimicry of dormer windows, which nobody can ever reach nor look out of? Not so, but in mere incapability of better things. I am sorry to have to speak thus of any living architect; and there is much in this man, if he were rightly estimated, which we might both regard and profit by. He has a most sincere love for his profession, a hearty honest enthusiasm for pixes and piscinas; and though he will never design so much as a pix or a piscina thoroughly well, yet better than most of the experimental architects of the day. Employ him by all means, but on small work. Expect no cathedrals of him; but no one, at present, can design a better finial. There is an exceedingly beautiful one over the western door of St. George's; and there is some spirited impishness and switching of tails in the supporting figures at the impost. Only do not allow his good designing of finials to be employed as an evidence in matters of divinity, nor thence deduce the incompatibility of Protestantism and art.

We believe the passage we have quoted was deleted by RUSKIN from the later editions of his work. But it is important as evidence of the spirit in which an effort to revive Gothic was received by contemporaries. It is, moreover, remarkable that there was much in common between the two men. Neither PUGIN nor RUSKIN could be said to have followed the customary routine for gaining knowledge of architecture. Neither cared much for the accepted divisions of periods of Gothic architecture, although both believed in the superiority of Gothic over Classic forms. Both valued the auxiliary arts of painting and sculpture, both were dogmatic writers and both displayed a contempt for the conventionalities of English life. RUSKIN probably was of opinion that "two stars keep not their motion in one sphere," and the student of Christ Church and the heir to a large fortune from whom artists expected commissions could hardly believe that a man who had passed through so many experiences was much more than a charlatan. But with all his fortune and cleverness in drawing, RUSKIN was not competent to make such a design as PUGIN submitted for Southwark Cathedral.

#### LIVERPOOL CATHEDRAL.

A MEETING of the Liverpool Cathedral committee was held on Monday. Sir Wm. B. Forwood presided, and there were also present the Bishop of Liverpool, Archdeacon Madden, Canon Penrhyn, Canon Sylvester, Rev. C. Harris, Messrs. Arthur Earle, Robert Gladstone, A. Crosthwaite, Richard Dart, T. Sutton Timmis, F. M. Radcliffe, J. Alderson Smith (hon. secretary) and G. Gilbert Scott (architect).

Mr. Scott presented a report on the progress which is being made with the building. He stated that the lady chapel has been advanced up to the window sills, and the triforium has been nearly completed. The vestries walls have been carried up to their full height, and the vestry aisle has been completed to the height of the ceiling. The walls of the choir are being proceeded with, and also the piers, and it is now possible to obtain some idea of the size and spaciousness of the choir when completed. Mr. Scott also submitted complete drawings of the lady chapel, showing the tracings of the windows and the triforium, which were approved by the committee.

A letter was read from the family of the late Mr. Robert Morrison, whose firm are contractors for the building of the cathedral, and who when he was alive took the warmest interest in the work. The letter stated that the family would like to erect in Mr. Morrison's memory two windows in the lady chapel, one from his widow and the other from his children.

The committee very gratefully accepted this offer with the expression of their appreciation of the personal interest which Mr. Morrison took in the work of the building of the cathedral during his lifetime.

#### THE ARCHITECTURAL ASSOCIATION

THE opening meeting of the Association for the year 1907-8 was held on Friday evening last in the premises at Tufton Street, Westminster, Mr. Walter B. Wood, president, in the chair.

The following gentlemen were elected members: Messrs. C. W. Bowles, G. Norman, H. F. L. Pilch, E. W. T. Hoare, jun.

The President distributed the prizes, medals and certificates gained by students in the last session.

#### Presidential Address.

Fellow-members of the Architectural Association, has become a custom in the past for your President to address you at the beginning of each session. The President has discussed in able language many topics connected with the Association and architecture in general. The great selection of the topics in which we are all interested makes the selection of a subject a task of no little difficulty.

The past history of the Association and its aims and hopes for the future, and the whole duty of an architect from the time he enters the schools till he finally lays down his pencil, have been constantly dealt with by your Presidents, and at first sight it does not seem that much more can be said. Yet the actual position of the Architectural Association and the position of the architect changes so rapidly from year to year, that I think I may confidently ask you to listen once more to a few words on the same subject.

I cannot begin my address to you without some expression of thanks for the very great honour that you have placed me in this chair. As years go on the duties of President become one of increasing difficulty, and I am conscious of what is expected of him and the amount of time and thought he has to give to fill this responsible position, and secondly on account of the difficulty of following the distinguished Presidents before him. I am conscious, therefore, that I enter upon my year of office with some misgivings that I enter upon my year of office; but I trust your help and co-operation, and that of the Council, will not altogether fail. Your past president, Mr. Balfour, was well fitted to carry on the work of the Architectural Association, and his most unfortunate death was a very real disaster not only to himself but to you. If there was one man who was well able to do good work it was Mr. Balfour, and I am sure you will all agree with me in wishing him a speedy and complete recovery. His work fell naturally on your shoulders, and to Mr. A. Needham Wilson you owe a great debt of gratitude, whilst I can only say that as President I gained much knowledge of the work which has now been laid on my shoulders.

During the past session many important changes have been made in the educational work of the Architectural Association, and as you all know the schools, both day and evening, have been placed under the charge of one man, Mr. H. P. G. Maule—in whose hands I think we can leave the educational work. He has under him an efficient body of assistant masters, and with Mr. Varndell as master of the evening school, the increased success of our schools, I think, is a matter of very great gratification.

As a consequence of these changes we lose Mr. T. Green, whose work in the evening schools was of great value to the Architectural Association. We also lose the services of Mr. J. H. Squire, Mr. J. H. Markham, Mr. Welford and Mr. F. R. Hiorns, and I wish on behalf of the Architectural Association to thank them most sincerely for their work in the past and wish them success in their future careers.

The day school at present numbers some sixty students, under the guidance of seven masters, while the evening school has sixty-five students. These numbers must give us all ground for serious thought, especially when we think of the comparatively short time (some thirty years) that the schools have been in existence. At first sight it would seem that from these schools alone a sufficient number of architects annually entering the profession is great in proportion to the work to be done, and the value of encouraging so many young men to enter the list of architects would be questioned. But after reflection it seems to me that the justification of our educational system can be found in the old days, up to some fifteen to twenty years ago, when the system of articulated pupils was the only means of learning our work, many more incompetent students entered the profession. The want of method in teaching, if teaching could be called, resulted in the fact that comparatively few emerged who could properly be called qualified architects.

not think that after taking all things into consideration young men set out to be architects now than twenty ago, but they are now more under observation, and standard of proficiency has increased beyond all measure. This can only be counted a gain to the profession at large; also under our system, it is possible for a master in the school to ascertain at an early period the probable chances of success of each individual student and it is too late for him to take up any other profession. In connection with our schools I should like to say that the last report from the Board of Architectural Education is eminently satisfactory, and it is a matter of congratulation that after some correspondence and meetings with the Academy authorities our educational work as now organised has met with approval.

I wish here to state that it has been decided to open a class (particulars of which are furnished in the Brown Book), and it is hoped that many will take advantage of the opportunity. The study of the life under an efficient master is of great importance to architects, and a branch of our education too much neglected; the exceptional opportunity offered is one of which I hope many members will take themselves.

On the retiring members of the Council, Messrs. John Driver and Arnold Mitchell, on your behalf, I offer our best thanks both for their services and their generous contributions to the building fund, and to the new members, Mr. Drumwell Thomas and Messrs. J. S. Gibson, F. D. Ham and Baxter Greig I offer a very cordial welcome. To our hon. secretaries we owe a great deal, and especially to Mr. Henry Tanner, who is now one of your presidents.

To the permanent officials the Association owes more than it has any idea of, and the excellent work done by Mr. Driver and his assistants makes it possible to carry on our ever increasing affairs of the Architectural Association in a satisfactory manner. No one who has not been intimately connected with the inner working of our Association is able to appreciate the painstaking and devoted labour which is being done in all directions by Mr. Driver, without his knowledge, tact and energy the position of the Association would be an impossible one.

The Association has lost many of its members during the last year, and special reference must be made to the loss of its past hon. secretary, Mr. A. Maryon Watson. The increase in membership has been satisfactory. We have 1,727 on our books, and it is hoped that during the coming session we shall further add to our members.

We have now settled down in our new premises, and it is with very great satisfaction that I am able to announce that our building debt has been reduced to 712%. We must, however, not consider that our work is done, for though we are very shortly to be free from debt, the yearly increase of our expenses, especially in connection with our educational work, leaves but a small margin of safety. We must have a reserve fund on which we may be able to draw in case of emergency, but without being unduly optimistic, I think we may feel satisfied with our present financial position, more particularly as we have as hon. treasurer our president, Mr. H. T. Hare, an old and tried friend of the Architectural Association.

Our warmest thanks are due to the Royal Institute for its generous support, both financially and morally. It is a matter of congratulation that we have received in the past and still continue to receive from the leading body of the profession such encouragement and sympathy, without which we should find our work exceedingly difficult if not impossible. I may add that our collection of casts is now being completed, and should be of immense value; and I am glad to find that the general public are taking more interest in architecture.

The position held by the Architectural Association was never so high as at the present time. We occupy a peculiar and unique position as the great educating body in the profession. We represent the younger generation in a way in which no other society can claim to do, and in spite of our youth we are the teachers. This somewhat anomalous position is in reality our greatest strength. By a combination of circumstances we have assumed the position and responsibility of a great educating body. The Royal Institute to whom we owe so much, cannot undertake the education of the young, and we have voluntarily laid on our own shoulders, and because we represent the younger side of the profession.

The enthusiasm and high ideals of youth, combined with the capacity for hard work, alone make it possible for a scheme of education to succeed; without these we

should become dull and academic, unattractive and inefficient. But a body of young men who are educating each other would not be successful without cohesion.

Our Association has within itself opportunities not only for education but for social intercourse. Our athletic clubs are growing in numbers and popularity, the musical talent amongst our members is of a high order and the opportunity of meeting one another in many ways outside our professional work is not the least valuable of the many advantages of the Architectural Association.

But there is a point in connection with this subject which, I think, needs emphasis. There is a very large amount of organising work to be done which involves time and trouble, and members are not always ready to give these when called upon. If our Association is to continue on the lines which we have now laid down, each member must realise that it is his own individual effort that is required to further our aims and insure success. On each member rests this responsibility. He must be willing to give up his time if called upon to serve on committees, and to show by his example that he is a real member of the Architectural Association, and not be content alone to reap benefits resulting from the work of his fellow-members. Let us all work together to this end, so that the cohesion of which I spoke just now may be a reality.

I must ask the elder members to bear with me if I lay particular stress on the youthful side of the Architectural Association. But I doubt if any of us really feel old, and as far as our profession is concerned I think architects never grow old—I mean that they are always learning, though the capacity for acquiring and retaining knowledge may decrease with years. I am sure they will agree with me when I say that the desire to continue their education increases as time goes on—with the expansion of our horizon our thirst for knowledge grows stronger. We see more clearly the difficulties in our path and are more lenient to the mistakes of others. Our outlook is wider, and we endeavour to grasp the larger issues and strive for breadth and dignity, which are the greatest attributes of all fine architecture.

To the student whose career is before him I would say cultivate the practice of observation and endeavour to train the senses not only to see accurately but to retain facts. Sketching from memory is an excellent way of training the mind in this direction—sketch and measure whenever opportunities arise. R. L. Stevenson in one of his delightful essays tell us that as a boy he always carried with him two books, one to read and one to write in. So I would say, always have a sketch book in your pocket and keep your eyes open, and you will be astonished to find what a useful amount of information you will collect in a comparatively short time. Be accurate—it is astonishing how inaccurate many people are and into what difficulties it leads them.

The young architect is indeed the heir of all the ages. For him exists all that is noble and beautiful in the past. This is his glorious heritage, but in order that he may enter in and take possession he must have both sympathy and knowledge. I want each one of you to feel this personally. Do not be content only to sketch and measure whenever opportunity occurs, but read all that you can of the history of the architecture you are sketching, and endeavour to get at the thought which lies behind the work. For it is more than true that there is no new thing under the sun—each feature in succeeding styles has its origin in something done before, and each genuine piece of architecture can be traced through its evolution back to the original thought which produced it. Remember, too, that architecture is founded on necessity, and no building worthy of the name of architecture can be produced which does not fulfil the conditions for which it is intended. These conditions are altering every day, and he who would be successful must not only realise these changes, but also understand the conditions in the past which have produced the successful results which we all venerate.

Thus architecture to be alive must be progressive, and grow like other natural things. It cannot begin suddenly to produce entirely different forms any more than the rose tree can produce another kind of flower, and, like the rose, it requires judicious but severe pruning from time to time—cut off all the dead shoots and the unhealthy buds right back to the parent stem, for from that alone can we hope to see any beautiful blossom.

Cultivate self-reliance and the power of honestly facing difficulties with no shirking; you will often be surprised to find how difficulties diminish when fairly faced.

If after an honest endeavour you cannot find your way out of your troubles, you have here in the Association many who will willingly help, and this brings me to another point—cultivate friendships while you are young. That is the time when all the greatest friendships are formed. Youth is invaluable if only for this opportunity of making friends amongst the fellow workers of your own age—it will be more difficult as years go on, and in the keenness of competition we find little time to make friends. Hero worship is again a prerogative of youth and undoubtedly has its advantages, and is a healthy sign if not carried to excess. We all have had our heroes, and their influence on our life and work we older men can recognise; fortunate indeed is he whose judgment was sound and who has gained nothing but strength from the influence of the master in whose footsteps he attempted to tread.

Another of the advantages opened to the student by the present system of our day school before entering an office is the opportunity of getting advice on what to sketch and look for on his travels. I can well remember my feelings of bewilderment when first going abroad without any definite ideas. The practice of making a sketching tour on the Continent on completion of one's articles is not so prevalent as in days gone by. It is a custom which is well worthy to be observed, but to attempt it without some personal help and advice will in all probability lead to little benefit. A definite idea of what to aim at in sketching and measuring is as essential to the student as it is to the architect in his designs. To travel with one's eyes open is one thing, but to have them directed in the right direction is quite another matter.

The Architectural Association organises a great many visits both to old and new work, which I fear are not too well attended. But I strongly recommend everyone to avail themselves of the opportunity of seeing examples of good architecture which may not occur again—the critical faculties are sharpened by the many different views expressed on these occasions, and it is astonishing how often interesting points appear as the result of a keen discussion which might otherwise have escaped attention. I have purposely confined most of my remarks to the student who is setting forth on the difficult path of architecture, and in conclusion I would say, persevere in your work here in the schools, so as to get all the advantage possible from the system of training provided for you. Sketch and measure wherever possible with discrimination, and keep in mind the ultimate end of all your work. Be thorough and conscientious in all things. Build up your store of knowledge bit by bit, so as to fit yourselves for the responsibility that devolves on all architects. You will some day be in the position of spending someone else's money, and you will be required not only to show your knowledge, but to give the best possible value both from an artistic and commercial point of view.

Realise when the time comes to practise what you have learnt, and that each piece of work, however small, has an ultimate effect not only on your personal career, but on architecture in general. Every piece of work honestly and thoughtfully carried out advances our profession, and no work is too small or insignificant. From the smallest things may come the greatest. Beware of beginning to practise too soon. Many well-equipped and capable men have retarded if not ruined their future by premature practice—an extra year of study may make the whole difference between failure and success. Keep your eyes open and your intelligence sharpened wherever you go. Remember the broad rules of life and practise self-reliance and self-restraint. Realise that you will be called upon some day to show of what you are made. An architect requires more than mere technical knowledge of his profession if he is to be successful. The importance of a sound education is enormous. A public school, followed by an university degree, is not within the reach of all, but a general knowledge of the world can be acquired by each one of us. Modern languages, music, athletics, &c., all help to equip the student, and no outside knowledge comes amiss.

There are few points in the social life of our times with which an architect is not sooner or later brought into contact in the exercise of his profession.

It is easy to abuse athletics, but to play games brings out many qualities such as courage, patience, accuracy, forbearance and perseverance, which not only develop the character, but fit a man "to meet his enemy in the gate."

Mr. A. NEEDHAM WILSON proposed a vote of thanks to the President for his address, and congratulated him on the

proud position he had been called upon to occupy Association. Although it was no easy matter to follow the long line of distinguished presidents who had filled office, yet he thought the Association were also to be congratulated on having a president who would be a worthy successor to his predecessors. The speaker referred to the balance of the debt on the building fund reminded members that it had been the great aim of Balfour to clear the debt during his year of office, but it spoiled his endeavours. The speaker therefore suggested that the members should show their appreciation of Balfour by renewing their efforts to clear the debt at the ensuing session. The progressive vitality of the Association was a source of gratification to those responsible for its management. They endeavoured to the best of their ability to keep ahead of the requirements of the age, and he hoped they would see a period of increased progress under the present system.

Mr. H. T. HARE seconded the motion, which was supported by Messrs. Leonard Stokes, G. H. Fellowes P and A. Keen.

The PRESIDENT announced that at the next meeting on October 18 a paper by Mr. Halsey Ricardo entitled "The Future of Architecture" would be read.

### AUGUSTUS SAINT-GAUDENS.

TO many beyond the immediate circle of his later life, the death of Augustus Saint-Gaudens, says Kenyon Cox in *The Architectural Record* of New York, has brought a sense of personal loss. He had a great friendship, and in the course of his brilliant career established intimate relations with men in many walks of life; and no one who had ever known him well, however separated from him by these last years of illness and comparative retirement, can have felt anything other than a deep and continuing affection for him. To his friends he seemed greater and finer even than his life, and the gap he has left in their lives will be harder to fill than his vacant place in American art.

No one who ever came in contact with him, no one who ever saw his portrait can have missed one of his dominant characteristics, a fiery and compelling energy. That extraordinary head, with its heavy brow beetling above the but piercing eyes, its crisp and wiry hair, its projecting and great, strongly-modelled nose, was alive with power. Not so readily discernible at a glance were the gentleness, the patience, the sweetness, the delicate sensitivity and abounding sympathy that were equally a part of his nature. He could be almost ruthless in the assertion of his will when he felt it necessary to be so, yet there was a tenderheartedness in him which made it distasteful to him to inflict pain on anyone, and which made him strike the harder, when he did strike, to have it felt with. He was entirely and wholeheartedly devoted to his art, and until his later years had few other interests. One of the greatest alleviations of this time of suffering was his broadening and deepening love for nature and literature. Music he had always loved. It was his passion for his art which caused his rare acts of self-assertion, and it was this same devotion, no less than his natural kindness, that made him ever helpful to younger artists who showed any promise of achievement. Even in his last months of pain he would summon what was left of his old strength to give a word of criticism and advice above all a word of commendation, to anyone who needed the one or had earned the other. The essential goodness of the man was most felt by those who were closest to him, and he could command, as few have been able to do, loyalty and love of the assistants upon whose aid he was more and more forced to rely. The faculty of communicating to them his ideas and desires and of producing through the hands of others, work essentially his own, became extraordinarily developed in him, at cost of heroic effort and of what strain upon brain and nerves one can ever know.

But however much his vivid and lovable personality may have meant to his friends, for the world at large it is his work that counts and will endure. He earned for himself the recognised position not so much of our foremost sculptor as of our greatest artist, indeed he was one of the first artists of his day in this country. It is not difficult to understand the feeling that though one may not entirely sympathise with it, that his art was scarcely sculptural in its essential quality.

ling of the *morceau* was not especially his affair, and  
ems of mass and weight and structure, of stress and  
ure of movement, were not those which most  
sted him. He did not, apparently, care greatly for  
uman figure as a figure—an affair of bones and  
es and integument—and, after his student days, pro-  
no nude except the purely decorative *Diana* of the  
on Square Tower. But in the presence of such work  
what, after all, does it matter whether or not we  
it sculpturesque, or whether we call it sculpture at all,  
ent some new name for it? It is art, and art of the  
and most profound. So Ghiberti may be said to  
produced pictures in bronze rather than true reliefs,  
ichel Angelo, a sculptor if ever there was one, thought  
ates of San Giovanni worthy to be the gates of  
ise, and the world would almost as lief be without  
iefs of the Parthenon as without Ghiberti's pictures.  
an age too much given to naturalism, to the scientific  
er and to the display of technical ability, Saint-  
ens was always and essentially the artist, the artificer  
uty, the searcher for perfection. First of all, and by  
e, he was a designer, and exquisiteness of design was  
ality he most consciously strove for—the quality on  
he expended his unresting, unending, persevering  
Never was artistic conscience more exacting, choice  
fastidious, industry more unwearied, and the result  
proportionate to the effort. There is nothing more  
more delicate in line, more ethereal in illusiveness  
face than his many small reliefs, portraits of women  
children; nothing more purely and nobly beautiful  
his caryatids or angelic figures, and his power of  
n rose with the dignity of his subject until it reached  
unsurpassable expressiveness of composition as is  
n in the Shaw memorial or the equestrian statue of  
man.

ut that which makes the art of Saint-Gaudens so  
icant for us is a greater power than this conscious  
f design; it is what must always be a more or less  
conscious power—that of a penetrating and creative  
ination. Without his strength of imagination he  
d have been a delightful decorative artist, worthy to  
mpared with the most charming of the Florentines;  
it he became something much more than this—he  
ne a great original force.

is less uncommon form Saint-Gaudens's imaginative  
er shows itself in his grasp of character—in that  
athetic perception and unerring presentation of  
iduity which makes him one of the greatest modern  
ers of the portrait statue. His earliest important work,  
*Tarragut*, showed this command of characterisation in  
a slightly less degree than his more mature produc-  
s, and it reached its culmination in such masterly pre-  
ations of personality as the *Lincoln* and the *Sherman*.  
instinctive knowledge of the significant elements of  
acter, the elimination of the merely accidental, the  
ity of feeling and the breadth of treatment evinced in  
place such figures as these among the world's few  
y monuments to its great men. Half French, half  
s, as he was by blood, Saint-Gaudens was wholly  
rican in feeling. He had lived through the time of  
ivil War and had felt the stir of it in his veins, and these  
esentations of the heroes of that conflict are among the  
national as they are among the most vital things that  
rica has produced in art.

ore evidently, though not more really, imaginative is  
vention of such an ideal portrait as the *Deacon Chapin*  
portrait of such convincing verisimilitude that one has  
ulty in believing that it is invented and that no such  
ndiment of New England puritanism ever existed  
e flesh. But the highest flights of Saint-Gaudens's  
ination were in the invention of such ideal or sym-  
al figures as the *Angel of Death* in the Shaw  
orial or the striding *Victory* of the Sherman group.  
as a bold enterprise to place them where they are,  
ling thus in the same work the real and the ideal, the  
al and the allegorical, but the boldness is justified by  
ss. In either case the entire work is keyed to the  
of these figures, and the figures themselves are no  
conventional allegories, no purely decorative acces-  
s, but true creations. To their creator the unseen was  
al as the seen—nay, it was more so. That Shaw was  
g to his death at the command of duty was the only  
g that made Shaw memorable. That Sherman was  
hing to a victory the fruits of which should be peace  
the essential thing about Sherman. Death and Duty—  
ory and Peace—in each case the compound ideal found

its expression in a figure entirely original and astonishingly  
living, a person as truly as Shaw or Sherman themselves.  
He could not have left them out. It were better to give up  
the work entirely than to do it otherwise than as he saw it.

But the most profoundly original and imaginative of  
Saint-Gaudens's creations is that wonderful, enigmatic,  
brooding figure in the cemetery at Washington—a figure  
that has been called by many names and whose meaning is  
mystery—a figure one would wish, were it possible, to  
place above his own tomb as the fitting memorial of his  
genius. Her enigma remains unsolved, but such an artist  
as he who made her is surely immortal in the only sense  
in which humanity can be sure of immortality. His mind,  
his spirit, his character, have taken on enduring forms and  
are become a part of the inheritance of mankind. And  
even if, in the lapse of ages, his name should be forgotten—  
as are the names of many great artists who have gone before  
him—yet his works will remain; and while any fragment  
of them is decipherable the world will be the richer in that  
he lived.

## A VARIED CAREER.

**A**N official notice is given by the Chicago Chapter of the  
late James Rowland Willett, a member. He was  
born in Dublin, Ireland, June 23, 1831, but went with his  
parents when quite young to America, and settled in Phila-  
delphia. He died in Chicago, Illinois, May 9, 1907.

Mr. Willett started in life as a stereotype moulder, after-  
wards matriculated in the Polytechnic College of the State  
of Pennsylvania and received his degree as Bachelor of  
Mine Engineering in 1854. He practised this profession  
until the outbreak of the Civil War. Then he entered the  
United States army and was appointed by General Freemont  
in 1861 as lieutenant of engineers. He performed duty as  
an engineer of fortifications and took active part in many  
battles. In 1863 he was made post engineer at Nashville  
and had charge of the construction of all fortifications in  
and about Nashville. In 1864 he was made inspector of  
fortifications of the district of Tennessee. During this year  
he was also made major of volunteer engineers, at the same  
time being made chief inspector of railroad defences. He  
was discharged from the army September 26, 1865, with  
the rank of brevet lieutenant-colonel. After the war  
Mr. Willett was appointed inspector to report on the  
condition of the Government buildings throughout the  
South which had been destroyed by the ravages of the  
war, after which he was appointed superintendent of the  
erection of the new Government building at Nashville,  
Tenn., and commenced the practice of architecture. Just  
after the fire he moved to Chicago and opened an office, the  
first commission being the building for the *Chicago Times*,  
one of the leading papers. In 1876 he built the first large  
apartment building in Chicago. In 1878 he was appointed  
architect for the Eastern Hospital for the Insane at Kan-  
kakee, Ill., the first asylum to adopt the cottage system.  
During his practice in Chicago he was architect for many  
public and private buildings throughout the West. In 1900  
Mr. Willett retired from business and devoted the rest of  
his life to books and study. He was a deep student and a  
vigorous worker as well as an authority on many branches  
of his profession, contributing many reviews on professional  
books to architectural journals. He lectured, wrote and  
did considerable research work in graphics and in the  
heating of buildings.

Mr. Willett joined the American Institute of Architects  
in 1870 and was one of the organisers of the Chicago  
Chapter. He was always zealous in maintaining the high  
standing of his profession, honourable in his dealings with  
his brother architects and never in any way compromising  
for the sake of a commission.

**The Selby Abbey** restoration committee have met and  
reported that the total funds amounted to 37,000*l*. The  
elevation of the tower in accordance with the original  
design of the structure which fell in 1690 was discussed,  
and it was decided to proceed with the project. The  
meeting resolved to erect a choir screen in accordance with  
Mr. J. Oldrid Scott's design at a probable cost of 700*l*. A  
considerable saving on the estimates was reported, and  
with an additional sum of 10,000*l*. the abbey would be com-  
pletely restored, including the erection of the south tran-  
sept. The reopening of the nave will take place on  
October 19.

## NOTES AND COMMENTS.

It was decided at a public meeting held in May that a minimum of 250,000*l.* was needed to enable the University of Oxford to meet the more pressing demands upon it. Contributions amounting to 56,700*l.* have been promised, and Lord CURZON, as Chancellor of the University, appeals for the completion of the sum required. A large proportion will have to be expended on building. A chemical laboratory to cost 30,000*l.*, an electrical laboratory to cost 15,000*l.*, an engineering laboratory to cost a similar amount, and laboratories for hygiene and materia medica are needed. More lecture and classrooms are desirable. Dr. ARTHUR EVANS is making a special appeal for the purchase of property which is a source of danger to the Ashmolean Museum and University galleries. It comprises a builder's extensive timber store and a petrol store. The galleries most immediately threatened from the first effect of a conflagration include those containing the priceless specimens of the Fortnum collection, the lobby with the Tradescant collection, and the annexe to the picture gallery, with the Rembrandt etchings. Should a serious fire break out in the neighbouring sheds and stables the main part of the picture galleries also could hardly escape. If the whole of the property necessary to insure safety could be acquired the outlay would be 30,000*l.* Additions to the museum and galleries are necessary, and the estimated outlay is at least 16,000*l.* An Egyptian-room and a lecture theatre are also essential, and would involve a cost of about 5,000*l.* It is claimed that owing to the really perilous situation in which both the museum and galleries are placed it is impossible to deny that some of these needs are of a more urgent nature than those of any other University institution.

IRELAND is a poor country. But Government departments are in error when they conclude that materials must be cheaper than in England, and that workmen will accept less wages. The low prices which were fixed for labourers' cottages is an instance of their mistaken views. The National schools, which seem to be in danger of collapse, are proofs that strange notions about cheap building existed several years ago. Another instance is likely to be afforded by technical schools. In 1889, when the Local Taxation Act enabled a part of the money obtained through beer and spirits to be applied to the building of such schools, England took advantage of it. Not till ten years afterwards did the Irish people condescend to believe that they were deficient in technical knowledge. Now they profess to be still more anxious, and on Monday a deputation waited on the Vice-President of the Department of Agriculture and Technical Instruction, seeking building grants. Mr. RUSSELL was favourable, but evidently he has the economical craze, as if jerry-built schools would serve the purposes required. Between 4,000*l.* and 5,000*l.* each he considered sufficient for big schools. But what he desired was to see technical schools which would not cost more than 300*l.* or 400*l.* for entire cost, including, we suppose, the expensive apparatus. Mr. RUSSELL declared himself to be an opponent of extravagant buildings, and told the deputation he would rather have education going on than pay for ornament. That is merely a platitude of the kind which orators of Mr. RUSSELL's stamp indulge in. If he would erect a building for manual instruction at his own cost he would soon discover that 300*l.* would go only a small way towards it.

THERE are a great many houses in England which from the extent of the collections of works which they contain deserve to be considered as miniature museums. Unlike museums they are, however, rarely open to public inspection. The owners preserve them for their own gratification or that of select friends. There are signs that a less selfish spirit is arising. Sir RUPERT BOYCE, the professor of pathology in Liverpool University, and who is one of the analysts for the city, has

in his residence, known as Park Lodge, Prince's a valuable collection, especially of pottery. He had experience of the facilities which are offered residents in Amsterdam to show their treasures all who care to see them, Sir RUPERT is now the experiment of imitating the Dutch practice. Collections can be seen by all who have any interest in them. It is to be hoped he will have no occasion to repent of his generosity, and it may be expected other collectors will also realise the excellence of property in trust as it were for the public.

It does not require much knowledge of the history of Dutch art to be acquainted with the connection of the Six family with many of the artists. The etching of *Burgomaster Six* by REMBRANDT is one of the master's works. The paintings, which were borrowed direct from the artists, are still to be seen by anyone who cares to seek permission in the fine old house at the Heerengracht, Amsterdam. It has become doubtful whether the famous collection will long remain in its entirety. One of the present owners has, it is resolved to part with his share of the pictures. In 1702 they were considered to be the supporters of the distinction of the family, and it was a duty to preserve them in their entirety. Whether an apportionment among the heirs was arranged seems to be uncertain, but some of the masterpieces are already assumed liable to removal from Holland. For the *Woman with a Milk Pail*, by JAN VAN DER MEER VAN DELFT, the sum of 700,000 florins is said to be asked, and money can be obtained in order to enrich an Amsterdam gallery with the small picture. There are amateur dealers who consider many other pictures of little interest. The little portrait of *Ebthraim Bona*, a physician, and the unfinished *Burgomaster Six* by REMBRANDT, GERARD DOW'S *Girl at a Window*, *Dentist*, TERBURG'S *Concert*, HOBBEEMA'S *Forest*, &c. are among those which, when once seen, are never remembered. It is believed that the other heirs will still preserve their pictures from dispersal.

GEORGE PALMER COUNCIL SCHOOL, READING.

LAST week we published the perspective drawings of these new schools at Reading, and we had the pleasure of giving the plans this week. The description was also published in our last issue.

PREMISES, FENCHURCH STREET AND ROOD LANE, E.C.

THIS office building was erected in accordance with the designs of Mr. EDWARD B. ELLIS, of 18-19 Fenchurch Street, for Messrs. KLEINWERTS. The front is of Portland stone and grey granite, and the front steps of mahogany, the fine dome and dormers being covered with copper. There is a very effective staircase with walls of which have been lined with Pavonazzi Cipollino marble by Messrs. WALTON, GOODWIN, CRIPPS, and a mahogany panelled dado. The mental ironwork is by Messrs. STARKIE GARDNER & Co. The building is warmed by hot water circulated from the boiler in the sub-basement, which has been excavated out to a considerable depth below the ground level for strong-rooms, &c. The floors have been proofed and the constructional steelwork is by Messrs. HOMAN & RODGERS. The general building work and the whole of the mahogany and teak fittings and ornamental plastering have been executed by Messrs. HOWE & WILLIAMS, Ltd., builders, 11-17 Bermondsey Street, London Bridge, S.E.

RECEPTION ROOM, 22 PORTMAN SQUARE, W.

# GILBERT SCOTT ON THE HOUSES OF PARLIAMENT.

following evidence was given by Mr. Gilbert Scott before the select committee on the Palace of West-

are, I believe, the architect of Liverpool Cathedral?—

is so. The designs you prepared for Liverpool Cathedral you study a great deal the adaptation of Gothic to modern times?—Yes.

is the special reason why we wish to have evidence from you. Are you well acquainted with this building?—Over the interior for the first time yesterday. Of the outside I have known and admired very much. Have you been through the courts?—No, I have not seen the internal courts.

Many people think that is the best part of the building.—I have not been able to have seen them. I went over the interior of the building, and, if I may give a sort of general impression, the effect produced upon my mind in going round, was to say that it was entirely in accord with Mr. Norman Shaw's opinion—that it is very much overdone. It struck me there was far too much decoration, if you call it so. There is a lack of repose and concentration; no restraint.

Do you think there is not sufficient plain wall surface?—There is not sufficient plain wall surface. Until the surfaces are altered and made more simple, it seems to me to put more decorations in the way of paintings.

Does it not surely extend to all parts of the building, and not only the walls?—Well, yes, I think it does to pretty well all.

Would you have the Royal Gallery as it is now, with no pictures in it and no others along the walls there?—It struck me that that wanted completing. But then the surroundings want simplifying so as to give concentration.

What way would you suggest?—First of all I should like to get rid of a lot of the gilding, and the varnish on the wood strikes me as being out of character with Gothic architecture. I should have more white wall surfaces.

Would you not extend that, would you, to leaving the frescoes in the King's Robing Room?—You remember there are two panels unfilled in that room. The room with the series of pictures of the Legend of King David?—I am afraid I omitted that room.

As regards what is commonly called the Moses room where there are two pictures, would you not complete that room?—It seemed to me that wherever paintings begun they ought to be completed so as to get breadth of effect, but at the same time I should simplify the surroundings so as to concentrate upon the decoration. That struck me.

Do you say you have not seen the King's Robing Room; would you apply what you say to the Moses Room?—The varnish on the oak seems to me to be entirely out of character; I should like to see it pickled off with a solution of lime and soda, which produces a nice grey effect like old oak which has been bleached.

*Earl of Carlisle.*

What has been done in the dining-room further down?—I have not seen that room, but I should very much like to see it, because it seems to me that that is what is wanted.

*Chairman.*

Do you think that the effect in corridors—for instance, the corridors leading to the House of Lords—is destroyed by having pictures in them?—No, not if the decorations are made more Gothic in feeling. I think there is a lack of true Gothic feeling in most of the interior. It is mechanical and hard, and the true spirit does not seem to be quite got hold of.

Is it true all through the House, I think?—That is so. In the two corridors, you would agree, are not injured by paintings; would you not, then, treat the third corridor, which leads up to the Cromwell bust, in the same way?—I do not quite know which corridor you refer to. I mean the corridor leading from the central hall?—In the corridors and rooms in which no paintings exist I hesitate very much to recommend paintings being inserted. I should certainly advise that they should be kept out of the way and not have paintings inserted. I agree with Mr. Norman Shaw's view about the state of decorative art in England at present. Very little encouragement

seems to be given to artists, and so far as I have seen their work does not harmonise with the architecture.

*Earl of Carlisle.*

Do you think that the absence of a school of decorative painters in England is partly to be attributed to the fact that no encouragement is given to them, and that the fact which Mr. Norman Shaw mentioned of the existence of M. Puvis de Chavannes and other artists in Paris with an excellent feeling for architectural decoration may be partly attributed to the fact that work was given to them to do in public buildings?—I think that is quite true. Architects are afraid to entrust the decoration of their buildings to artists in the present state of decorative painting, and artists will not give the time to studying that branch of art when they receive no encouragement from architects.

Therefore it is possible that, if the contention that painting should not be employed in this decoration prevails, it will tend to continue that state of things?—That is so.

*Chairman.*

That will be bad for the interests of art, so far as painting is concerned?—That is so. Some one must make a start, and they will probably have to suffer for it, though it will no doubt have a good effect in the end.

You have heard Mr. Norman Shaw's suggestion with regard to additions to the height of parts of the building; what is your view about that?—It seems to me to depend so much upon the amount of accommodation that is required. If it is only a small matter of telephone boxes and refreshment bars I should have thought that it could have been arranged in the courts, but if it is a question of providing additional committee-rooms, of course sufficient accommodation would not be provided in that way.

This committee has nothing to do with providing committee-rooms; we are only considering the question of the decorative treatment of the building. You say, as I understand, that you have not been in the courts, so that you cannot have looked to see how far they are suitable for the purpose suggested?—No.

Have you taken note of these excrescences which have been referred to—refreshment bars, telephone boxes and so on?—Yes.

What treatment would you suggest for getting rid of all those things?—It seems to me you want special rooms for these things to be put in, and that they should not be placed in the open corridors.

But then special rooms do not exist?—If there is not much accommodation required I should have thought the difficulty could have been got over by additions towards the courtyards.

That means an addition through the whole storeys of the House, basement and all, does it not?—Yes, it probably would.

You think you cannot provide for it simply by projections?—It could be done, but I doubt whether it would provide sufficient room.

Have you any special suggestions to make to the committee resulting from your examination of the building?—The chief suggestion I should like to make as my own personal opinion is that there is far too much decoration at present, and that before anything is done there should be a good deal of simplifying in the way of getting rid of the gilding and the varnish and the various decorations that at present exist.

In short there is much to be undone?—There is much to be undone before anything is done—that is what strikes me.

It is not worth while bearing in mind that the whole idea with which the decoration of the building was started was for the encouragement of art in England and especially pictorial art. If you look at the proceedings of the Fine Arts Commission you will see that that was so.—Of course that should be considered. At the same time it is so risky that one hesitates to advise it.

Supposing that that canon were observed which was laid down by Mr. Norman Shaw, that the painting was always to be in subordination to the architecture, would your objection to painting be as great then?—If you can get your man I should say have the painting. Otherwise I should hesitate to advise it.

You heard what Mr. Norman Shaw said about the special treatment of St. Stephen's Hall—have you any views to give the committee upon that point?—I quite agree with what he said that plain wall surfaces are what it requires.

Would you complete the mosaics in the Central Hall?—As those two mosaics already exist there, I should complete the others so as to get breadth of treatment, though personally I never considered mosaic to go with Gothic architecture at all. To my mind it is quite out of character with the style.

In short, your idea of the proper treatment of the building would be not so much the finishing of what is now blank and incomplete as the reduction of the ornament where it exists?—That would be my view.

Would you tell us how you would set to work on the House of Lords itself, for example?—That is a room I did not look at very long.

That is the most gilded of all?—Yes, I should do away with most of the gilding and varnishing and substitute simpler glass. I should have less colour; I should have white glass with coats of arms and so forth, which is more suitable for domestic work than figure subjects.

*Earl of Carlisle.*

Is it not a fact that taste of fashion in decoration changes rather rapidly? Do you not think that if one generation reconstitutes the decorative scheme of this building it is opening a rather interminable process of surface alteration?—I contend that the true feeling of Gothic architecture is far better understood now than it was in the earlier years of the Gothic revival; there is not so much scholarly knowledge, but there is far more artistic feeling.

You do not think that each successive fashion thinks that of the one before?—I would rather not express an opinion upon that.

*Chairman.*

I suppose you would extend the remark that you made with regard to the glass in the House of Lords to the rest of the building?—Yes.

To St. Stephen's Hall and other parts of the building?—Certainly.

Is there anything you would like to suggest further to the committee?—There is one thing which I have just remembered. The tile flooring throughout the building seems to me to produce a very cheap and, to my mind, shoddy effect. I think a far finer effect would be produced with marble, say black and white marble in large squares, or something of that kind. Then as regards the treatment of Westminster Hall, that is the one building in which there is a sense of repose, and there a bit of colour seems to me to be needed in the way of materials or hangings on the walls behind the statues.

You would hang the walls there, would you?—Certainly. I do not think anything should be done to the walls themselves in the way of bas-reliefs or anything of that kind, but a rich bit of colour in the way of tapestry or hangings would, to my mind, be most suitable.

Would you do that whether there were statues there or not?—Certainly.

Would you remove the statues?—I should. I may add that the electric-light standards in that hall seem to me out of keeping. There you get the gilding and the chocolate-coloured paint, and a general coarseness of design which seems to me to be entirely out of character with that old hall.

Do you think you could by any means introduce more light into Westminster Hall throughout? As it is the roof is hardly seen, or at any rate it is always very dark.—I should not advise anything in the way of structural alteration.

It is a moot point, is it not, whether there was not once a window in the roof?—I do not happen to know as to that.

*Earl of Carlisle.*

I do not know whether you have expressed an opinion on the question which we put to Mr. Norman Shaw and others as to the effect of tinting statues in the same way as the statue of Sir William Harcourt put up in the House of Commons lobby has been tinted?—I have not seen that particular statue, but I am strongly in favour of the idea of tinting.

**The Crown** has purchased a number of properties in Park Street, Windsor, leading to the Long Walk and adjacent to the Castle precincts. The tenants have been given six months' notice to quit, when the houses will be demolished, and others as they are acquired, to make room for a number of projected improvements at Windsor Castle, including the provision of a garage for their Majesties' motor-cars.

## ST. MARK'S, VENICE.

THE Vienna correspondent of the *Morning Post* takes the advantage of going over St. Mark's to see the engineer in charge of the repairs, and has described in his journal what is being done to the famous basilica.

There are two different parts of St. Mark's on which workmen are at present engaged. The first and most important restoration is that of the so-called "Angolo di Sant' Alipio," which projects from the left corner of the atrium opposite the entrance of the Merceria. The condition of the "Angolo di Sant' Alipio" is a matter of history and the mode of its construction. It was built by the rest of the basilica about the middle of the thirteenth century, when the Republic had been enriched by the capture of Constantinople, and the technical blunder was committed of uniting this new edifice to the masonry of an already existing church, already some two centuries old. When one climbs to the scaffolding inside the "Angolo," one can distinctly see the marble cornice which forms the outside of the original building. At this point the huge fissures large enough to insert one's hand, and the masonry of the thirteenth century has separated from the masonry of the eleventh, which is far stronger and much surer. But this is not the only sign of collapse. The foundations of the "Angolo di Sant' Alipio" were laid in a cemetery, and the edifice, therefore, reposed upon a soft matter, which had to support a weight of 36,000 grammes. As long ago as 1765 the displacement of the corner of St. Mark's was noticed, and the architects of the period accordingly fastened the columns of the "Angolo" to the main building by means of an iron bar. This bar is now the sole support of the upper part; it is a few degrees out of its original position, and if it cracks the engineer remarked while we stood beneath it, the whole would come the "Angolo." Nor is this all. The iron bar, inside the columns, owing to oxidation, has begun to split the marble, and it is necessary to remove the oxidised metal and replace it by bronze—a difficult and slow process. Owing to a curious accident, it is not possible to calculate with mathematical accuracy the extent of the displacement of the "Angolo" since 1800. In that year the authorities erected a simple iron sundial on the columns. An iron rod was inserted in the marble, and a deep furrow was drawn down the pillar, which furrow runs south. It has been observed that at midday the end of the rod no longer falls on this line, but is 3 metres out of the perpendicular; it therefore follows that the "Angolo di Sant' Alipio" has been displaced much as 12 centimetres in 107 years. Last May the plan for its complete repair was examined by the committee of management; this plan has just been approved, and the work of saving this left corner of the atrium is being actively prosecuted. The men employed on the repairs of St. Mark's, who have their workshop in the desecrated cemetery of St. Basso hard by, do eight and a half hours of work exclusive of their meals and their siesta, and every day of an hour's delay costs them a quarter of their daily wages. Inside the basilica itself the so-called "Arcone dell'Albero genealogico della Vergine"—a name derived from the genealogical tree of the Virgin, which is depicted in the mosaics of the north transept—is now in the hands of the workmen. A large wooden platform has been erected to support the arch, and the men have now finished their task here. The mosaic had fallen away from the wall, the bricks had begun to drop on to the floor, and huge cracks had appeared in the masonry, of which photographs were shown me. This part of the arch has been entirely replaced by new materials, and the scaffolding can be taken down.

There are two other parts of the basilica which have been taken in hand, but upon which work has been temporarily suspended. These are the "Tribune of the Patriarch" and the "Arch of the Apocalypse." The importance of the repairs to the former may be judged from the fact that the four "Tribunes" have to support the greatest weight of the basilica. One can see, now that the mosaic has been stripped off this "Tribune," the portion of the arch, close to the keystone, as we call it, which has fallen 7 centimetres. It was here that the mosaic, that a coin of the year 1205, the year of the Latin Conquest of Constantinople, was found last year. As for the "Arch of the Apocalypse," at the west end of the church, that is still filled up with the massive sculpture which seems as if it, too, were intended to last for ever. It was judged that the "Angolo di Sant' Alipio" required urgent attention, so the "Apocalypse" has been left

much as it was when I visited it last year. There is some scaffolding in the atrium of the church, but the removing the iron clamps from inside the columns and placing them with bronze has been successfully finished, and no one but an expert would now know the columns had been raised and replaced.

At the great basilica the administration of St. Peter is undertaking extensive repairs at three smaller churches—St. Moisè, St. Giuliano and St. Gallo. Outside the city, but also undergoing structural restoration, are important churches of the Frari, of St. Francesco della Vigna, and SS. Giovanni e Paolo. Thus it is by no means surprising to see the monuments in many of the Venetian churches of Benedetto Pesaro, for instance, in the Frari, is surrounded with scaffolding, while one of the largest pictures, the Doge's Palace has been taken down from the Venetian lagoon, in short, is given over to architects and artists, but the work has been undertaken none too late. It is now believed that all the threatened edifices are saved.

## ANCIENT EARTHWORKS.

The report of the committee on ancient earthworks and fortified enclosures says there is a marked increase of interest taken in ancient defensive works and their historical memorials. It is seldom that the programme of the archaeological society's excursion does not include some ancient earthwork, camp or castle site; more attention is now given to our subject both in the transactions of societies and in the public press, and the honorary secretary receives a large number of increased interest in numerous letters coming from all parts of the country. At the same time respect for the relics of the past has not yet spread sufficiently to prevent the constantly recurring instances of destruction. Archaeological societies are asked not to overlook the complete schedules of earthworks existing in the country, included in their respective spheres, being the duty of the judicious circulation of such lists will stay the hands of the destroyer. It is remarkable how quickly the owner of a previously despised relic begins to value it when he finds that other people consider it of importance, and as few of our country's ancient remains are protected by law it is the more important to influence those who own the vast majority of the earthworks. Schedules are being prepared by the Yorkshire Archaeological Society, the East Herts Archaeological Society, the Cardiff Naturalists and by a few other societies. From destruction of ancient works of earth or stone for agricultural purposes, minor influences tend to their preservation; to these the attention of owners and occupiers and may well be drawn by archaeological societies. In some places, great trees, perhaps centuries old, grow on the site of an ancient camp, a tree is blown down or grubbed up, a large bite is thereby eaten out of the earth and nothing is done to fill up the hollow thus created, the cost of so doing is infinitesimal. Rabbits are allowed to burrow, gradually causing the banks to crumble and destroy their continuity, while gardeners and others are allowed to remove barrow-loads of the light material, which possess guarding walls of stone are even the mercy of the neighbourhood unless jealously guarded. That there is as much need as ever to keep the old fortifications is made manifest by a glance at the record of destruction contained in this report—a record very far from complete, for in many cases the destruction is accomplished unnoticed by anyone possessed of the means for the past.

Transference to public bodies of ancient castles and forts, though usually structures of masonry rather than earthwork strongholds, must be mentioned. Montagu Castle at Gorey, Jersey, long occupied as barracks and signalling station, has been presented to the island government for preservation. Scarborough Castle ruins have been handed by the Department of Woods and Forests to the Corporation of Scarborough on a thirty years' lease. The castle keep has been freed from rubbish, the castle has been cleared to a depth of 180 feet, and a large area of earth has been removed from the castle site. The urban council of Bishop's Stortford is purchasing the castle mount and the surrounding land, which will probably be used as a public garden or recreation ground. It is to be hoped that the utmost care will be taken to prevent injury to the great earthen mount, and to the interesting remains of the masonry of the

castle on the summit. The camp on Housestead farm at Castleshaw, in the parish of Saddleworth, Yorkshire, has been purchased by Mr. Samuel Andrew, of Oldham, and Major Lees, of the 4th Manchester Volunteer Regiment, with a view to the scientific excavation and permanent preservation of the fortress.

The destruction or mutilation of defensive earthworks, and even more of tumuli and barrows, is constantly proceeding in many parts of the country, but passes unrecorded in most instances. Cases which have come under notice include:—

*Abdon Burf.*—The remains of the camp on Brown Clee are in hourly danger of removal in the process of obtaining stone for the construction of the Cleobury Mortimer and Ditton Priors Light Railway. Coal apparently will also be worked on the hill. A tram line has been laid to the summit to facilitate the removal of stone. The camp known as Bitterley, on the Titterstone Clee, has so long been subjected to similar treatment that its fragments are hard to recognise.

*Barnard Castle.*—Mr. Duncan Montgomerie wrote in September last:—"I find that part of the original moat is being (and has nearly been) filled up by tipping town refuse into it. The portion referred to is on the north side and is where the ditch ran out on to the cliff. This is being done by the District Council with the consent of Lord Barnard, and the reason alleged is 'to make the descent less dangerous,' but the footpath does not touch this portion."

*Burghill, Herefordshire.*—The low mount close to the church has been levelled. It was of square form and moated.

*Ham Hill, near Montacute, Somerset.*—The quarrying operations referred to in our last report are further threatening the important remains of the camp.

*Harbledown, Bigberry, near Canterbury.*—Remains of earthworks are being further destroyed by digging for gravel on the south-west side.

*Harmondsworth, Middlesex.*—The poor remnants of a square camp, about 380 feet across, consisting mainly of a low enclosing rampart, have recently been completely levelled by agricultural operations. The camp was situated in the hamlet of Sipson Green, south of the Bath road.

*Leek, Staffordshire.*—Cock Low barrow, described in Bateman's "Ten Years' Diggings," p. 183, has been levelled to the ground, the owner and the local authority not agreeing upon terms for its retention.

*Lydiard Tregose, Wiltshire.*—Bincknoll Camp. Rubble digging on the site has materially injured the rampart of this ancient stronghold.

*Mendip Hills.*—Adjacent to the Castle of Comfort Inn, on the top of the range, were four curious ring-works; one has long since been destroyed, and recently another has been levelled to make a cabbage-field.

*Norwich.*—A portion of the castle mount has been cut away to provide a site for the extension of the shire hall. (It appears that the mount is natural to a greater extent than has been thought.)

*Stannon, St. Breward (East), Cornwall.*—Mr. H. St. George Gray informs us that a viaduct in connection with the china clay works is being built and that "the granite is being obtained from the fine group of hut circles in some of the roughest pasture fields on Stannon farm and between that farm and the Fernacre Circle and Rough Tor. I am wondering whether an attempt will be made to destroy the circles next. I am assured by the farmers in the neighbourhood that the circles are safe, being on common land; but the destruction of the hut circles is still in progress and likely to be for some time. I am told that the agent of the owner of Stannon farm (Sir Wm. Onslow) has given permission for these hut circles to be destroyed, as they are a hindrance to agriculture in the fields, but other hut circles, near those outside the fields and on the common, are not to be touched, and this remark applies also to the circles. However, if stone enough cannot be obtained from the fields it is quite possible that permission may be sought to remove granite from the moors, and if so the circles would be imperilled."

*Witham, Essex.*—Destruction of the remnants of this priceless historic record continues. There will soon be little or nothing remaining of the burh of Edward the Elder.

*Aldeburgh, Suffolk.*—The raised ground or low mound on Barber's Point, long supposed to be the site of a settlement of the Roman period, has been partially explored by the Aldeburgh Literary Society, and has yielded Samian and other ware.

*Berwick-on-Tweed.*—Accumulated earth and rubbish have been removed from parts of the Brass Mount and the Cumberland bastion of the Elizabethan walls, and further work is now in hand by the Berwick Historic Monuments Committee.

*Cadster, near Chapel-en-le-Frith, Derbyshire.*—Mr. W. J. Andrew has conducted a slight examination of a stone circle recently discovered by him, which discloses unusual features. The excavations were limited to a sectional trench two feet wide, and to removing the turf which covered some of the principal stones. His report will appear in "Memorials of Derbyshire," and detailed plans and particulars will be deposited with this committee.

*Caerwent.*—The principal work carried out upon the site of Venta Silurum during 1906 consisted of the excavation of a large house of the courtyard type in the land lately bought by Lord Tredegar. The interesting series of finds includes some bronze objects of greater artistic merit than usual.

*Carnarvon.*—Excavations in the progress of building operations are revealing further traces of the Roman station of Segontium.

*Coelbren, South Wales.*—Colonel W. Llewellyn Morgan's excavations of the Roman camp have disclosed evidence of a remarkable use of timber in the construction of the rampart and berm, especially at the angles, where ballista and other heavy engines of war may have been placed. The shallow outer trenches seem to have been designed not so much as in themselves obstacles to hinder attack of the fortress as to provide cover for sharpened stakes of hard wood. Many of these have been discovered.

*Corbridge-on-Tyne.*—Extensive and systematic excavations have been made on the site of the Roman city of Corstopitum, revealing part of the plan of the town and unearthing interesting remains. The exploration has been conducted by the Northumberland county history committee, under the supervision of Dr. Haverfield, Mr. C. L. Woolley and Mr. R. H. Forster.

*Essex Red-hills.*—A survey and excavations of several examples in the parish of Langenhoe were conducted in the autumn of 1906, resulting in the discovery of relics belonging to the late Celtic period.
